Nonlocal porous medium type equations

DIANA STAN

Basque Center for Applied Mathematics
(BCAM)

ABSTRACT: We present some recent results on two nonlocal generalizations of the porous medium equation $u_t = \Delta u^m$.

For the first model, $u_t = \nabla(u^{m-1}\nabla(-\Delta)^{-s})$, we construct a class of weak solutions for which the property of finite/infinite speed of propagation is discussed according to the parameter $m > 1$.

The second model $u_t + (-\Delta)^s u^m = 0$ was more investigated in the literature and we remind the main qualitative properties of solutions.

We conclude with a transformation formula between self-similar solutions of the two classes of equations considered.
