- 5 Conclusions and future work

- The generation of thematic maps from hyperspectral images by
  - classification of the pixel spectra.
- Scarcity of labeled information
  - semi-supervised training
- Combining both spatial and spectral processing.

We propose:

- 1 Spectra classification.
  - 1 Hybrid Extreme Rotation Forest (HERF)
- 2 A semisupervised training,
  - 1 k-means clustering and image spatial neighborhood.
- 3 Spatial regularization
  - 1 most frequent class in the neighborhood.

- 1 Introduction
- 2 Computational Methods**
- 3 Semisupervised classification and regularization
- 4 Experimental results
- 5 Conclusions and future work

- Heterogenous ensemble of classifiers
  - Extreme Learning Machines (ELM)
  - Decision Trees
- Partial adaptation to the problem domain

For  $i = 1 \dots L$

Computation of rotation matrix  $R_i^\alpha$ :

- Partition  $F$  into  $K$  random subsets:  $F_{i,j}; j = 1 \dots K$ 
  - For  $j = 1 \dots K$ 
    - Let  $X_{i,j}$  be the data set  $X$  for features in  $F_{i,j}$ .
    - $C_{i,j}$  obtained applying PCA on  $X_{i,j}$
    - Compose  $R_{i,j}^\alpha$  using matrices  $C_{i,j}$  .
  - Decide if  $D_j$  is a DT or an ELM
  - Train classifier  $D_j$  on training set  $(XR_{i,j}^\alpha, Y)$ .

## Classification Phase

Decision by majority voting

For a given  $\mathbf{x}^{test}$ ,

$$d_i = D_i(\mathbf{x}^{test} R_i^\alpha)$$

$$c^{test} = \max_i \{d_i, i = 1, \dots, L\}$$

# Semisupervised classification

input  $X_L = \{(\mathbf{x}_1, y_1), \dots, (\mathbf{x}_L, y_L)\}$

- 1 initial HERF classifier  $C_L : \mathbb{R}^d \rightarrow \Omega$ ,  $C(\mathbf{x}_i) = \hat{y}_i$ .
- 2 K-means:  $k_i$  the cluster assigned to sample  $\mathbf{x}_i$ .
- 3  $\mathcal{N}_j(r)$  spatial neighborhood of  $\mathbf{x}_j \in X_L$  of radius  $r$

extended training set  $X_{L+U} = X_L \cup X_U$

$$X_U = \{(\mathbf{x}_i, y_j) \mid \mathbf{x}_i \in \mathcal{N}_j(r) \wedge k_i = k_j \text{ for some } \mathbf{x}_j \in X_L\}.$$

- 4 semisupervised classifier  $C_{L+U} : \mathbb{R}^d \rightarrow \Omega$
- 5 classify whole image:  $\hat{Y} = \{\hat{y}_i = C_{L+U}(\mathbf{x}_i)\}_{i=1}^N$ .

- 1 most frequent class inside the spatial neighborhood of each pixel:

$$\tilde{y}_i = \arg \max_y |\{\hat{y}_j \in \mathcal{N}_i(r)\}|.$$

- 1 Introduction

- 3 Semisupervised classification and regularization
- 4 Experimental results**
- 5 Conclusions and future work

Real hyperspectral image data sets collected by AVIRIS sensor.

- Indian Pines ->  $145 \times 145$  pixels, 224 spectral bands and 16 classes.
- Salinas C ->  $217 \times 512$  pixels, 224 spectral bands and 16 classes.
- Salinas A ->  $83 \times 86$  pixels, 224 spectral bands and 6 classes.

Comparative results

- Multinomial Logistics Regression (MLR) with active learning<sup>1</sup>
- We use the same size of the seed training set and validation by 100 Markov runs

---

# Numerical results - Salinas

**Table :** Results on the Salinas A data set at each step of the algorithm and corresponding results in the comparing publication.

<b>SALINAS A</b>	Our Method	MLR
Classification (L=18)	48.90 (18.00)	-
Classification [(L=18) + U]	95.1 (2.41)	90.86
Segmentation [(L=18) + U]	<b>99.13</b> (1.26)	<b>96.74</b>

**Table :** Results on the Salinas C data set at each step of the algorithm and corresponding results in the comparing publication.

<b>SALINAS C</b>	Our Method	MLR
Classification (L=128)	81.18 (2.35)	81.97
Classification [(L=128) + U]	86.64 (1.30)	82.40
Segmentation [(L=128) + U]	<b>93.34</b> (1.58)	<b>89.61</b>

**Table :** Results on the Indian Pines data set at each step of the algorithm and corresponding results in the comparing publication.

<b>INDIAN PINES</b>	Our Method	MLR
Classification (L=160)	51.96 (4.90)	63.19
Classification [(L=160) + U]	66.78 (3.03)	63.44
Segmentation [(L=160) + U]	<b>79.38</b> (4.04)	<b>75.60</b>

# Visual results - Salinas A

(a)

(b)

**Figure :** Visualization of classification results on Salinas A using 18 labeled samples. (a) After supervised classification with  $OA=97.58\%$ . (b) After spatial regularization with  $OA=99.78\%$ .

# Visual results - Salinas C

(a)

(b)

**Figure :** Visualization of classification results on Salinas C using 128 labeled samples. (a) After supervised classification with  $OA=88.22\%$ . (b) After spatial regularization with  $OA=91.80\%$ .

# Visual results - Indian Pines

(a)

(b)

**Figure :** Visualization of classification results on Indian Pines. using 160 labeled samples. (a) After supervised classification with  $OA=66.03\%$ . (b) After spatial regularization with  $OA=78.46\%$ .

- 1 Introduction
- 2 Computational Methods
- 3 Semisupervised classification and regularization
- 4 Experimental results
- 5 Conclusions and future work**

- New semisupervised approach involving
  - semisupervised training based on spectral clustering and spatial neighborhood
  - **two forms of spatial regularization**,
    - Selection of unlabeled samples
    - Regularization over the final image segmentation
  - an innovative hybrid ensemble classifier **HERF**.

## Computationally inexpensive

- classifiers used have **quick** learning algorithms and
- the regularization processes are computationally cheap.

Thank you for your attention.
