## Eskerrak

Esta Tesis Doctoral ha sido realizada en el Departamento de Química Orgánica I de la Facultad de Ciencias Químicas de Donostia de la Universidad del País Vasco bajo la dirección del Dr. Claudio Palomo y la Dra. M ${ }^{\text {a }}$ Antonia Mielgo, a quienes quiero expresar mi más sincero agradecimiento por la dedicación y el esfuerzo realizados y por haberme dado la oportunidad de incorporarme a este grupo de investigación. La financiación de este trabajo ha provenido de una beca predoctoral del Ministerio de Educación, Cultura y Deporte (AP2010-4762), además de la ayuda para la movilidad de investigadores concedida por la Universidad del País Vasco para estancias en el extranjero.

My sincere thanks go to Dr. Mauro Adamo for giving me the opportunity to realize a three-month stay in The Royal College of Surgeons of Ireland (RCSI). I would like to thank my project partners Hasim, Stefano and Chiara who helped to enrich this experience with all discussions and exchanges of knowledge. I am also deeply thankful to other members of the lab which made my stay in Dublin really enjoyable with many activities, trips and dinners.

Bihotzez eskertu nahi diet laborategian nirekin egokitu diren kide guztiei, zuek gabe ez dut uste hau bukatzeko gai izango nintzenik. Batez ere eskertu azken etapa honetan nire proiektuan lagundu didaten Ana eta Iurreri, hasieran sartu nintzenean zeuden labokideei, bide luze honetan laborategitik igaro diren beste hainbat lagunei, eta nola ez, azken inkorporazio berriei. Izen zerrenda luzeegia da baina bereziki eskertu Irati, Jone, Nerea, Julen, Haizea, Iñaki, Amaiur, Sandra, Ekhi, Saioa... hainbeste bazkari, mendiirteera, hondartza, afari... organizatzeagatik; doktoretza honi beste kolore bat emateagatik!

Bereziki gogoan izan nahi ditut nire kuadrillako lagunak, beti nigan sinestu dutelako eta eman dizkidaten animoengatik azken etapa honetan. Beti pazientzi handiarekin nire desesperazioak entzuteko prest egon zaretelako.

Azkenik, eskertu Aiora eta gurasoei. Nahiz eta ondo jakin ez zertan nabilen beti babestu nautelako. Ezin ahaztu ere, nire gainontzeko familia, beraiei esker mundu honetatik deskonektatzeko oso beharrezko dudan beste bizimodu bat erakusteagatik.

## Summary

The objective of this PhD Thesis has been the search for new electrophiles and/or pronucleophiles for organocatalytic Michael reactions in which tetrasubstituted stereocenters are created. More specifically, interest has been focused in enolizable ester and $\alpha, \beta$-unsaturated ester surrogates which are challenging substrates in organocatalysis due to their low reactivity and/or stereoselectivity problems.

Our group has shown that $\alpha$ '-oxy enones can be employed in metal-catalyzed reactions as $\alpha, \beta$-unsaturated carboxylic acid surrogates as the resulting $\alpha^{\prime}$-oxy ketone adducts can smoothly be converted into the correspoding aldehyde, ketone or carboxylic acid derivatives through simple oxidative cleavage of the ketol unit. However, these Michael acceptors had not been previously employed in organocatalysis. In this Thesis we show that these templates are also efficient electrophiles in the organocatalytic Michael addition of $\alpha$-substituted cyanoacetates and azlactones (Scheme A) promoted by bifunctional chiral Brønsted bases as catalysts. In all these reactions a new tetrasubstituted stereocenter is efficiently created.

Scheme A.

Moreover, the addition of cyanoacetates is also efficient not only with fully unsubstituted $\alpha$ '-oxy enones, but also with $\beta$-substituted and $\alpha$-substituted ones. The corresponding Michael adducts are easily transformed into the corresponding esters, thus showning the efficiency of $\alpha^{\prime}$-oxy enones as $\alpha, \beta$-unsaturated ester surrogates.

On the other hand, in this Thesis we show for the first time the efficiency of pyrrolidin-2,3-diones as Michael donors in enantioselective organocatalytic conjugate additions catalyzed by bifunctional Brønsted bases with different electrophiles (Scheme B). For instance, the Michael reaction of these substrates with vinyl ketones, $\alpha^{\prime}$-oxy enones and di-tert-butyl azodicarboxylates has been explored. The resulting adducts are obtained in very good yield and stereoselectivity and, apart from being biologically interesting, they are also precursors of $\beta^{2,2}$-amino acids. Specifically, through their transformation into NCAs followed by ring opening $\beta$-amino acids, esters and amides can be easily affordable. This represents a new catalytic approach to $\beta^{2,2}$-amino acids, that allows for the first time their direct coupling with nucleophiles.

Scheme B.

Finally, and under the guidance of Prof. Mauro F. A. Adamo from the Department of Pharmaceutical and Medicinal Chemistry in The Royal College of Surgeons in Ireland a quick methodology has been established for the synthesis of benzylic chlorides and $\beta$-chloro(thio)esters through oxidative desulfurative chlorination of tertiary alkyl phenyl sulfides and $\beta$-thio carbonyl compounds (Scheme C). The reaction occurs with high stereospecifity, thus being a valuable tool for the synthesis of optically active chlorides from enantioenriched sulfa-Michael adducts.

## Scheme C.

## Resumen

El objetivo de esta Tesis Doctoral ha sido la búsqueda de nuevos electrófilos y nucleófilos para reacciones de Michael organocatalíticas que involucran la creación de centros tetrasustituídos. En concreto, el interés se ha centrado en equivalentes sintéticos de ésteres enolizables y de ésteres $\alpha, \beta$-insaturados, que son sustratos en general problemáticos en organocatálisis debido a su baja reactividad y/o problemas de estereocontrol.

Nuestro grupo de investigación ha demostrado con anterioridad que las $\alpha$ '-oxi enonas mostradas en el Esquema A son sustratos eficientes en diversas reacciones catalizadas por metales (tanto cicloadiciones como adiciones de Michael).

## Esquema A.

Más significativamente, estos sustratos son además equivalentes sintéticos de derivados de ácidos carboxílicos $\alpha, \beta$-insaturados ya que los aductos resultantes pueden ser fácilmente transformados en aldehídos, cetonas o ácidos carboxílicos mediante escisión oxidativa de la unidad cetólica (Esquema B).

## Esquema B.

Sin embargo, estos aceptores de Michael no se habían empleado anteriomente en organocatálisis. En esta Tesis Doctoral se demuestra que estas plantillas son electrófilos eficientes en reacciones de Michael organocatalíticas tanto con cianoacetatos $\alpha$ sustituídos (Esquema C) como con azalactonas (Esquema D) promovidas por bases de Brønsted bifuncionales y quirales. En todos los casos se crea un centro tetrasustituído con elevada estereoselectividad.

Esquema C.

Más concretamente, se ha estudiado el comportamiento de $\alpha$ '-oxi enonas con diferentes patrones de sustitución en el doble enlace (no-sustituídas, $\beta$ - y $\alpha$-sustituídas) en reacciones con cianoacetatos $\alpha$-sustituídos (Esquema C). Los correspondientes aductos de Michael se obtienen con altos rendimientos y con un excelente estereocontrol. En estos casos también se han conseguido las trasformaciones a ácidos carboxílicos, cetonas y aldehídos, corroborando de esta manera que estas plantillas son equivalentes sintéticos eficientes de derivados de ácidos carboxílicos $\alpha, \beta$-insaturados.

La misma metodología se ha investigado con otro tipo de nucleófilos heterocíclicos. Más concretamente, se han empleado azalactonas en la reacción de Michael con $\alpha^{\prime}$-oxi enonas en presencia como catalizador de la misma base Brønsted bifuncional y quiral empleada anteriormente (Esquema D). En estos casos se genera asimismo un centro estereogénico tetrasustituído. Se han obtenido resultados satisfactorios con la $\alpha$ '-oxi enona no sustituída; sin embargo, con enonas sustituídas la reacción no tiene lugar y se recuperan los productos de partida.

## Esquema D.

Por otro lado, las pirrolidonas mostradas en la figura A son de gran interés por su presencia en compuestos biológicamente activos. Sin embargo, mientras la síntesis asimétrica y reactividad de las $\gamma$-butirolactamas I, y sus análogos II han sido ampliamente investigadas, las pirrolidin-2,3-dionas III apenas han sido exploradas como pronucleófilos en reacciones organocatalíticas. Desde el punto de vista sintético, la unidad de cetoamida cíclica combina caraterísticas nucleofílicas y electrofílicas, lo que permitiría llevar a cabo varios tipos de transformaciones de forma secuencial o en cascada con electrófilos y nucleófilos adecuados.

Estabilizador de la interacción proteína-proteína

Figura A

En la presente Tesis Doctoral se demuestra por vez primera la eficiencia de pirrolidin-2,3-dionas como dadores de Michael con diferentes electrófilos en reacciones de Michael organocatalíticas y enantioselectivas catalizadas por bases de Brønsted bifuncionales. Se ha estudiado la adición conjugada de estos sustratos a vinil cetonas, $\alpha$ '-oxi enonas y azodicarboxilatos de terc-butilo (Esquema E). Los aductos resultantes, que son biológicamente interesantes, se han conseguido con buenos rendimientos y enantioselectividades. Además también son precursores de $\beta^{2,2}$-aminoácidos, ya que mediante su transformación al NCA correspondiente seguido de la apertura del anillo, se pueden obtener $\beta$-aminoácidos, ésteres, amidas y derivados.

$\beta$-aminoácidos, ésteres, amidas...

## Esquema E.

Finalmente, bajo la supervisión del Prof. Mauro F. A. Adamo del Departamento de Química Farmacéutica y Médica de Royal College of Surgeon in Ireland se ha desarrollado una metodología rápida para la obtención de cloruros bencílicos y $\beta$ chloro(tio)ésteres mediante una cloración desulfurativa (Esquema F).

## Esquema F.

## Laburpena

Doktore Tesi honen helburu nagusia tetraordezkatutako zentroak sortzen diren Michael adizio organokatalitikoetarako egokiak diren elektrozale eta nukleozale berrien bilaketa izan da. Zehazki, arreta ester enolizagarrien eta ester $\alpha, \beta$-asegabeen baliokide sintetikoengan jarri da, sustrato hauek bereziak direlako organokatalisiaren eremuan, bai beraien erreaktibitate baxuagatik eta bai erreakzioaren estereokontrola zaila delako.

Gure ikerketa taldean $\alpha^{\prime}$-oxi enonak azido karboxiliko $\alpha, \beta$-asegabeen baliokide sintetiko onak direla erakutsi da, hain zuzen ere, metalek katalizatutako erreakzioetan. Bertan lortzen diren aduktuetako zetol unitatea aldehido, zetona edo azido karboxiliko bilaka daiteke oxidazio simple baten bidez. $\alpha$ '-Oxi enonak ordea, ez dira erabili Michael hartzaile moduan organokatalisiaren arloan, eta Tesi honetan Michael erreakzio organokatalitiko batzuetan eraginkorrak direla frogatu da. Zehazki, beraien portaera ikertu da $\alpha$-ordezkatutako zianoazetatoen eta azalaktonen adizio-konjokatuetan. Ikusi da erreakzio hauek Brønsted base bifuntzional eta kiralek katalizatu dezaketela, tetraordezkatutako zentro berri bat eraginkorki sortuz (A Eskema).

A Eskema.

Gainera, zianoazetatoen Michael adizioa eraginkorra da baita $\beta$ - eta $\alpha$-posizioak ordezkatuta dituzten $\alpha$ '-oxi enonekin ere. Lortzen diren Michael aduktoak esterrera transforma daitezke ondoren, berriro erakutsiz $\alpha^{\prime}$-oxi enonen balioa ester $\alpha, \beta$-asegabeen baliokide sintetiko bezala.

Bestalde, pirrolidin-2,3-dionen eraginkortasuna lehendabizikoz frogatu da Michael emaile bezala. Horretarako, elektrozale ezberdinekin erreakzioa burutu da Brønsted base bifuntzionalen eraginpean (B Eskema). Elektrozale bezala binil zetonak, $\alpha$ '-oxi enonak eta di-tert-butil azodikarboxilatoa aztertu dira. Adizio aduktuak etekin eta enantioselektibitate onetan lortzen dira, eta biologikoki interesgarriak izatez aparte, $\beta^{2,2}$ aminoazidoen prekursoreak dira. Hain zuzen ere, aduktu hauen oxidazioak NCAk (Nkarboxi anhidridoak) sorrerazten ditu eta hauen irekierak nukleozale egoki baten ( ROH , $\mathrm{RNH}_{2}$ ) erasoz $\beta$-aminoazidoak, esterrak eta amidak erraz lortzea ahalbidetzen du. Sintesibide honek $\beta^{2,2}$-aminoazidoak lortzeko hurbilketa katalitiko berri bat eskeintzen du.

B Eskema.

Azkenik, Royal College of Surgeons in Ireland-go Kimika Farmazeutiko eta Medizinaleko Departamentuan Mauro F. A. Adamo irakaslearen gidaritzapean egindako egonaldian garatutako lana aurkezten da. Bentzil kloruoak eta $\beta$-kloro(tio)esterrak lortzeko metodologia azkar bat deskribatu da alkil fenil sulfuroen eta $\beta$-tio konposatu karbonilikoen klorazio desulfuratiboaren bidez (C Eskema). Erreakzioa estereoespezifitate handiarekin gertatzen da; honenbestez, enantioaberastutako sulfaMichael aduktuetatik optikoki aktiboak diren kloruroak lortzeko erabil daiteke.

## 1. Introduction

Life is based on a large number of reactions catalyzed by enzymes. This type of reactions are responsible for the origin of asymmetry and chirality in life. The concept of chirality was first formulated by Lord Kelvin (Figure 1, a) more than one century ago: "I call any geometrical figure, or group of points, chiral, and say that it has chirality, if its image in a plane mirror, ideally realized, cannot be brought to coincide with itself". ${ }^{1}$ One example of a chiral object is a hand; a left hand cannot be superposed with a right hand. In the case of molecules, the pair of non superimposable mirror images are called enantiomers and in chiral environments, such as biological systems, they can exhibit different biological activity. The most representative example of this is thalidomide whose two enantiomers show very different biological properties (Figure 1, b).

Figure 1. a) Lord Kelvin, who first defined the concept of chirality. b) Both enantiomers of thalidomide and their biological properties.

Since the tragedy of thalidomide, ${ }^{2}$ the demand of enantiomerically pure compounds (EPC) ${ }^{3}$ has growth sharply in the pharmaceutical industry but also in other areas including agricultural chemicals, flavors, fragances and new materials. Historically, the best way to obtain enantiomerically pure compounds was to isolate them from natural sources. However, there was a considerable dependence on natural products for the production of enantiomerically pure pharmaceuticals. Owing to the importance of the chiral molecules in life, synthetic chemists have made great efforts in developing protocols to obtain enantiomerically enriched compounds. In general, there are three

[^0]strategies for this purpose. If the target compound is synthesized in its racemic form, one alternative is to separate both enantiomers by resolution ${ }^{4}$ by means of adequate physical or chemical methods. Another option, known as chiral pool, ${ }^{5}$ makes use of enantiopure natural products as a source of chirality and all transformations are carried out starting from these compounds and without altering the initial stereogenic elements. Finally, asymmetric synthesis ${ }^{6}$ uses achiral substrates as starting materials and the asymmetric induction can come from a chiral ligand, ${ }^{7}$ a chiral auxiliary ${ }^{8}$ or a chiral catalyst. ${ }^{9}$ While the two formers require the use of stoichiometric amounts of those compounds, asymmetric catalysis which is based on the use of substoichiometric quantities of a chiral enantiopure substance that accelerates the reaction and controls the stereochemistry of the products, has growth sharply during the last decades.

In the field of asymmetric catalysis three different groups can be distinguished: biocatalysis, organocatalysis and metal catalysis (Scheme 1). Catalytic asymmetric methods have expanded their application from the enzymes (biocatalysis), ${ }^{10}$ which have been the prime catalysts in academia and industry for over a century. In the last decades

[^1]of $20^{\text {th }}$ century, metal catalysis dominated the field; ${ }^{11}$ however, since the beginning of 2000 , organocatalysis, ${ }^{12}$ which implies the use of small organic molecules to catalyze organic transformations, has become the third pillar of asymmetric catalysis.

Scheme 1. Strategies of asymmetric catalysis.

In the context of asymmetric catalysis, soft enolization ${ }^{13}$ constitutes an attractive tool for the deprotonation of some carbonyl compounds. ${ }^{14}$ In this strategy a relatively weak chiral amine is generally used to reversively and catalytically deprotonate a relatively acidic substrate. However, to date, the carbonyl compounds for these reactions are restricted to 1,3 -diones, $\beta$-ketoesters, malonates, $\alpha$-cyanoacetates, 3 -substituted oxindoles and related systems; all of them being easily deprotonated by relatively weak chiral Brønsted bases.

### 1.1. Chiral Brønsted bases as organocatalysts

Among the organocatalysts working through non covalent interactions chiral Brønsted bases have been thoroughly explored. ${ }^{15}$ According to the IUPAC, a Brønsted

base (BB) can be defined as a molecular entity capable of accepting a hydron (or proton) from an acid or the corresponding chemical species. From the perspective of organic transformations, proton transfer is often considered a key activation step of one of the reaction components that precedes the new bond creation in the coupling of reactants through the formation of a chiral ionic pair. Figure 2 shows the catalytic cycle followed in this type of reactions.

Figure 2. Catalytic cycle promoted by Brønsted bases.

Various nitrogen-containing functionalities have been used for the design of chiral BB catalysts. Among them, tertiary amines, ${ }^{15}$ guadinines, ${ }^{16}$ amidines and imidazoles ${ }^{17}$ are the most prominent (Figure 3, a). In this context, alkaloids, particularly those of cinchone family are a source of enantiopure BB catalyst candidates providing access to various BBs which display reasonable constitutional and stereochemical diversity (Figure 3, b). Another type of BB catalysts are derived from $\alpha$-amino acids which are cheap starting materials. Other non-natural sources, such as synthetic 1,2-diamines and binaphthol derivatives, have also been employed as enantiopure material precursors for the design of Brønsted base catalysts (Figure 3, c).

### 1.1.1. The concept of "bifunctionality"

Enzymes are examples of polyfunctional catalysts since they are able to combine multiple interactions in the transition states or intermediates to lower the activation energy increasing reaction rates and specifity. Considering these principles of enzymes, many chemists have designed bifunctional catalysts which include two different reacting functional sites (Figure 4). ${ }^{18}$ Bifunctional chiral catalysts are able to simultaneously bind and activate two reacting partners because of the presence of two catalytic units which

[^2]can work as Lewis acid/base or Brønsted acid/base centers improving reaction efficiency and/or selectivity.

Figure 4. General structural pattern of bifunctional catalysts.

In the first example of a Brønsted base catalyzed reaction published in 1975 by Wynberg (Figure 5, a), ${ }^{19}$ it was shown that cinchona alkaloids promote the enantioselective addition of $\alpha$-ketoesters to vinyl ketones operating as bifunctional catalysts (the tertiary amine moiety was proposed to deprotonate the $\alpha$-ketoester pronucleophile and the hydrogen-bond donating hydroxyl group to activate the enone electrophile). However it was not until 1997 that Shibasaki employed for the first time the same bifunctional activation strategy efficiently with metal catalysts in the aldol reaction of aldehydes with ketones (Figure 5, b). ${ }^{20}$ Later, this metal catalytic concept was extended to other transformations. ${ }^{21}$ In 2003, Takemoto and co-workers developed 1,2-trans-cyclohexyldiamine-derived thiourea catalysts for enantioselective Michael additions of dimethylmalonate to nitroalkenes (Figure 5, c). ${ }^{22}$ The authors propose that the Lewis acidic thiourea moiety activates the nitroalkene electrophile by hydrogen-bonding while the basic amine deprotonates the pronucleophile. ${ }^{23}$ In view of the precedent set by

[^3]Takemoto's catalyst, since 2005 many research groups have described different transformations promoted by thiourea-substituted cinchona alkaloid catalysts with excellent results. ${ }^{24}$

H -bond donors:
activate the electrophile Rawal, 2008 ${ }^{25}$

Figure 5. Representative examples of first developed bifunctional catalysts.

In 2008, Rawal's group described a new type of bifunctional catalysts based on the squaramide functionality (Figure 5, d). ${ }^{25}$ Before, squaramides had been used as artificial anion receptors in molecular recognition studies due to their ability to interact with negatively charged species such as carboxylates and nitrates. ${ }^{26}$ Since then,

[^4]squaramide catalysts have emerged as an effective alternative to the urea/thiourea- and guanidine-base catalysts. ${ }^{27}$

### 1.1.2. Squaramides $v s$ thioureas

Squaramides are remarkable four-membered ring systems derived from squaric acid that are able to perform up to four hydrogen bonds. They contain two hydrogen-bond donors $(N-H)$ and two carbonyl acceptors ( $C=O$ ). Compared to thioureas, squaramides are more "bifunctional" because they offer three possible $H$-bonding patterns as shown in Figure 6, a. Both (thio)urea and squaramides are structurally rigid, although, there are some structural differences between them. The distance between the two $N-H$ groups in thioureas has been calculated to be approximately $2.13 \AA ;{ }^{28}$ whereas Rawal estimated the distance for squaramides to be $2.71 \AA^{25}$ (Figure 6, b). Furthermore, the "square geometric" structure of the cyclobutenedione ring induces a convergent orientation of the $N-H$ groups. Both functionalities have the possibility of delocalizing the nitrogen lone pair through the carbon-oxygen double bond; however, only in the case of squaramides further delocalization can occur through the partially aromatic cyclobutenedione system. ${ }^{29}$ Thus, the $N-H$ acidity of the squaramide is higher compared to thiourea due to their vinylogous amide nature (Figure 6, c). Cheng calculated a number of popular squaramide organocatalysts' acidities and compared them to thioureas. ${ }^{30} \mathrm{He}$ found that the $\mathrm{p} K_{\mathrm{a}}$ values of squaramides are lower than their thiourea analogues, in which $0.13-1.97 \mathrm{p} K_{\mathrm{a}}$ gap units are obtained. The fact that squaramide is more acidic indicates that it engages in stronger hydrogen bonds than the corresponding thiourea. These results may explain why lower loadings of squaramide catalysts can perform with even higher reactivity in a broad range of asymmetric transformations.

[^5]
b)

2.13 Å

d)

Figure 6. a) Possible $H$-bonding patterns of squaramides. b) Calculated distances between $N-H$ groups. c) Comparison of the zwitterionic forms of the thiourea and squaramide skeletons. d) General preparation scheme for the squaramide catalysts.

The additional advantage of these squaramide catalysts is their facile preparation from easily available or commercially starting materials. The first step involves a substitution reaction of dimethyl squarate which is followed by a similar substitution reaction with a chiral primary amine (Figure 6, d). In most cases the catalyst precipitates out of solution making chromatographic purification unnecessary. ${ }^{27 \mathrm{c}}$

### 1.2. Organocatalytic asymmetric Michael reactions

Among all the organic reactions the Michael addition or conjugate reaction of nucleophiles to electron-poor alkenes is one of the most frequently used $C-C$ and $C-$ heteroatom bond forming reactions in organic synthesis. ${ }^{31}$ In general, the Michael reaction involves the addition of a nucleophile $(\mathrm{Nu})$ or Michael donor to an electron deficient olefin known as Michael acceptor (Figure 7). The electron withdrawing group (EWG) of the Michael acceptor stabilizes the carbanionic intermediate of the addition and

[^6]this intermediate can either be protonated or react with another electrophile, to create up to two new stereocenters. Therefore in these reactions the control of both, the enantioand diastereoselectivity are of considerable significance and a broad range of chiral metal-based ${ }^{32}$ and metal-free catalysts ${ }^{33}$ have been described in this field.

$\mathrm{Nu}=$ Nucleophile (nucleophilic atom $\mathrm{C}, \mathrm{O}, \mathrm{N}, \mathrm{S}$ or P )
EWG = Electronwithdrawing group ( $\mathrm{CHO}, \mathrm{COR}^{\prime}, \mathrm{CO}_{2} \mathrm{R}^{\prime}, \mathrm{CONR}^{\prime}{ }_{2}, \mathrm{SO}_{2} \mathrm{R}^{\prime}, \mathrm{SOR}^{\prime}, \mathrm{NO}_{2} \ldots$ )

Figure 7. General scheme of the Michael reaction.

A wide range of Michael acceptors and donors have been reported for this reaction. Commonly employed Michael acceptors are $\alpha, \beta$-unsaturated carbonyl compounds (aldehydes, ketones, esters, amides, etc.), but it is also usual the use of other activating groups such as nitro, sulfonate, sulfoxide, phosphate or phosphonate. Moreover, the nucleophilic atom of the donor can be a carbon or a heteroatom such as $O$, $N, S$ and $P$ (oxa-, aza-, sulfa- and phospha-Michael reaction). ${ }^{34}$

As said before, reactions under proton transfer conditions promoted by soft enolization have demonstrated to provide a mild and operationally simple approach to the deprotonation of certain types of carbonyl compounds; and this strategy has also been thoroughly investigated in asymmetric Michael additions. However, as previously

[^7]mentioned, the carbonyl substrates for these reactions are generally restricted to relatively acidic compounds such as 1,3 -dicarbonyl compounds, 3 -substituted oxindoles and related systems (13-18 $\mathrm{p} K_{\mathrm{a}}$ range). ${ }^{35}$ Generally, enolizable esters or carboxylic acid derivatives have been challenging in this strategy, because of their higher $\mathrm{p} K_{\mathrm{a}}$ values (approximately 19 in DMSO) ${ }^{35}$. Although recently it has been shown that the problem of this low reactivity may be addressed through the development of Brønsted base catalysts with increased basicity, ${ }^{36}$ most efforts still focus on the development of new pronucleophiles suitable for soft enolization. On the other hand, among Michael acceptors, simple $\alpha, \beta$ unsaturated esters and amides still also are challenging substrates in direct Michael additions and have only been employed in few successful conjugate reactions, mainly due to their inherent lower reactivity and the limitations associated to the activation/coordination of these compounds to a suitable catalyst. As an alternative, different efficient unsaturated ester/amide surrogates have been described to solve this problem.

### 1.3. Templates for asymmetric Michael organocatalytic reactions

Ideally, strongly biased achiral templates may decrease otherwise observed substrate-catalyst dependence, attenuating undesired fluctuations on the catalyst efficiency. The proper design of templates may result crucial in many difficult transformations, such as, the enantioselective generation of tetrasubstituted carbon stereocenters. ${ }^{37}$ The challenge of controlling the configuration of asymmetric tetrasubstituted centers is crucial in organic synthesis since they can be found not only in a range of important and useful compounds in pharmaceutical and medicinal contexts, but also in a large variety of natural products. Tetrasubstituted carbons can be prepared routinely by the face selective addition of a nucleophile to carbon-carbon or a carbon-

[^8]heteroatom double bond. Stereochemical induction may be achieved through neighboring functional groups in the substrate and/or in a chiral catalyst.

In this field during the last years various types of useful templates have been described, and a number of Michael acceptors and pronucleophiles (Michael donors) have been found efficient templates in asymmetric conjugate reactions under proton transfer conditions with the simultaneous creation of tetrasubstituted carbons. The most representative examples of known templates for Michael reactions are summarized below.

### 1.3.1. Michael acceptor templates

Among several categories of Michael acceptors, $\alpha, \beta$-unsaturated carbonyl compounds are of great synthetic significance. Adducts obtained from the conjugate reaction of a nucleophilic reagent to $\alpha, \beta$-unsaturated aldehydes, ketones or carboxylic acid derivatives have been really useful in many applications. However, Michael addition to carboxylic acid derivatives is not well suited for iminium ion activation catalysis and the most common activation mechanism relies on the coordination of the carbonyl group to a Lewis acid (metal catalysis) or a H -bond donor species (organocatalysis).

To solve this problem in these difficult transformations, on the one hand some properly designed templates have been developed. Attractive $\alpha, \beta$-unsaturated carboxylic acid surrogates are expected to posses certain qualities: i) enhanced activation of the substrate towards nucleophilic attack; ii) improved coordination to the chiral catalyst; and, iii) easy and mild replacement upon demand of the activating group.

On the other hand, as previously mentioned, a less developed alternative to overcome the low inherent electrophilicity of this type of Michael acceptors in Brønsted base catalysis is to raise the Brønsted basicity of the catalyst. Increased Brønsted basicity in the catalyst raises the concentration of the nucleophilic conjugate base and, as a consequence, the rate of the addition step. Recently, Dixon and co-workers reported a highly enantioselective sulfa-Michael addition of alkyl thiols to unactivated $\alpha$-substituted acrylate esters catalyzed by the bifunctional iminophosphorane (BIMP) superbase organocatalyst C1 (Scheme 2). ${ }^{38}$ The strong Brønsted basicity of the iminophosphorane moiety provides the necessary activation of the alkyl thiol pronucleophile, while the two tert-leucine residues and the thiourea hydrogen-bond donor facilitate high enantiofacial selectivity in the protonation of the transient enolate intermediate.

[^9]

Scheme 2. Organocatalytic sulfa-Michael addition of thiols to $\alpha$-substituted acrylates catalyzed by BIMP

## C1. Dixon, 2015.

The basic mode of activation of $\alpha, \beta$-unsaturated carbonyl compounds assumes that the lone electron pair of the carbonyl oxygen atom coordinates to the Lewis acid or is involved in hydrogen-bonding interactions. Thus, the activation of the substrate is the result of a lowered energy of its LUMO, which induces an easier reaction with a nucleophilic reagent. In this field, several two-point binding acyl templates bearing an additional coordination site have been developed (Figure 8). Monodentate templates may lead to two degenerate $C=O \cdots$ metal complex geometries complicating stereocontrol. Nevertheless, bidentate templates can form cyclic chelates with metals due to the presence of an extra coordination site, thus facilitating stereocontrol.

Figure 8. Monodenate $v s$ bidentate acyl templates.

Following this idea, different activated carboxylated bidentate templates have been reported for stereoselective Michael additions. These templates can be classified in heteroatom-linked and carbon-linked templates depending on their structural differences (Figure 9). Among heteroatom-linked templates representative examples are $\alpha, \beta$ unsaturated imides, $\alpha, \beta$-unsaturated $N$-acyl heterocycles (pyrroles, pyrazoles and bentzotriazoles) and $\beta, \gamma$-unsaturated $\alpha$-oxophosphonates (Figure 9, a). Regarding carbonlinked templates worth of mention are $\beta, \gamma$-unsaturated $\alpha$-ketoesters, 3-methyl-4-nitro-5-alkenyl-isoxazoles and $\alpha$ '-hydroxy enones (Figure 9, b). The latter were introduced by our group in the realm of metal catalysis and now have been extended to the area of organocatalysis as will be outlined later.

LUMO energy values (eV) of some representative Michael acceptors are outlined in Figure 9, c. As more negative the LUMO value, more favored is the attack of the nucleophile affording the desired addition product.

a). After performing the asymmetric conjugate addition, a simple replacement of the activating group in the final Michael adducts can be achieved by acyl substitutions in the presence of a suitable nitrogen- and oxygen-centered nucleophile in the case of heteroatom-linked templates or by $C-C$ cleavage under oxidative conditions in the case of carbon-linked templates (Scheme 3, b). ${ }^{41}$

b)

Scheme 3. a) General retrosynthesis of templates. b) Template transformation through activating group replacement in the final Michael adducts.

### 1.3.1.1. Heteroatom-linked acceptor templates

### 1.3.1.1.1. $\alpha, \beta$-Unsaturated imides and $\alpha, \beta$-unsaturated $N$-acyl heterocycles

Among $\alpha, \beta$-unsaturated imides $N$-acyl oxazolidinones showed to be very useful chiral auxiliaries in asymmetric reactions after the pioneering work by the Evans group. ${ }^{42}$ Later, further investigation of these derivatives led to the successful implementation of several metal-catalyzed enantioselective processes through the use of achiral $N$-acyl oxazolidinone templates (Figure 10). The first example of the use of these templates in metal-catalyzed Michael reactions was reported by Evans in 1999 in the copper-mediated

[^10]conjugate addition of enolsilanes and the corresponding adducts were obtained in very good yields and stereoselectivities. ${ }^{43}$ Following this work the same group described other metal-promoted reactions with these templates. ${ }^{44}$

Figure 10. Evolution from a chiral auxiliary to an achiral template in Evans group.

However, the first use of $\alpha, \beta$-unsaturated imides (Figure 11, a) in organocatalysis was not reported until the year 2000 when Miller and co-workers published the enantioselective aza-Michael reaction of trimethylsilylazide ${ }^{45}$ to $\alpha, \beta$-unsaturated imides. ${ }^{46}$ After this work, Takemoto reported in 2005 the highly enantioselective organocatalytic Michael addition of several soft carbon-nucleophiles (malononitrile, methyl $\alpha$ cyanoacetate and nitromethane) to $\alpha, \beta$-unsaturated imides using the bifunctional thiourea $\mathbf{C} 2$ as catalyst (Figure 11, a, 1). ${ }^{47}$ It was demonstrated that the 2-methoxybenzamide moiety was key for reactivity and stereoselectivity in the reaction, which was attributed to a self-activation of the imide by intramolecular $H$-bonding. The proposed way of action of the bifunctional catalyst $\mathbf{C} \mathbf{2}$ is shown in Figure 11, a, 1, wherein the two imide carbonyl oxygens are proposed to coordinate to the two $\mathrm{N}-\mathrm{H}$ groups of the thiourea based catalyst.
$\alpha, \beta$-Unsaturated $N$-acyl heterocycles (Figure 11, b) have also been described as efficient Michael acceptor templates in organocatalytic reactions. These templates offer diverse coordination facilities for the engagement with $H$-bonding organocatalysts.

[^11]Moreover, these $N$-based heterocycles are usually good leaving groups and as such, highly suitable for subsequent acyl substitutions. Among these templates $N$-acyl pyrroles (Figure 11, b, 1), pyrazoles (Figure 11, b, 2) and benzotriazoles (Figure 11, b, 3) have been described.

ORGANOCATALYSIS

Figure 11. Representative examples of the use of N -acyl templates in Michael addition reactions.

In 2004 Shibasaki and co-workers demostrated for the first time the utility of $\alpha, \beta$ unsaturated $N$-acylpyrroles as monodentate ester surrogates in metal-promoted catalytic asymmetric epoxidation and conjugate additions. ${ }^{40}$ It has been calculated that the nitrogen lone pair in these substrates is delocalized, thus affording a similar level of LUMO energy as in simple enones. Later, Soós developed the first organocatalytic example in the Michael addition of nitroalkanes to $\alpha, \beta$-unsaturated acylpyrroles. ${ }^{48}$ Inspired by these results, the efficiency of these templates for the generation of tetrasubstituted stereocenters was extended to polyconjugated systems in the 1,6-conjugate reaction by Ooi in 2012 (Figure 11, b, 1, 1). ${ }^{49}$ A highly diastereo- and enantioselective 1,6-addition of azlactones to simple $\delta$-monosubstituted dienyl $N$-acylpyrroles promoted by the chiral iminophosphorane catalyst C3 was described to afford Michael adducts with a tetrasubstituted stereogenic center. To the best of our knowledge, this represents the only example of the use of $N$-acyl templates involving the generation of a stereocenter of this type.

An additional $N$-centered coordination site in the pyrrol template plays a crucial role providing $H$-bond acceptor sites for better organization and higher levels of selectivity with bifunctional $H$-bond donor catalysts. Therefore, the exchange of the pyrrol ring by a pyrazole or benzotriazol gives bidentate substrates which are templates with properly positioned hydrogen bond acceptors for activation by chiral organocatalysts. The efficiency of $N$-acyl pyrazoles has been demonstrated in the conjugate addition of $O$-benzylhydroxylamine ${ }^{50}$ and in cascade sulfa-Michael aldol reactions. ${ }^{51} \alpha, \beta$-Unsaturated acylbenzotriazoles have also been successfully applied as useful ester surrogates in the 1,4-addition of azlactones. ${ }^{52}$

As mentioned before, the main characteristic of all these templates is that replacement of the activating group in the final Michael adducts can be easily performed under the appropriate reaction conditions to afford different products such as ketones, esters and amides as shown in Scheme 4.

### 1.3.1.1.2. $\beta, \gamma$-Unsaturated $\alpha$-oxophosphonates

$\beta, \gamma$-Unsaturated $\alpha$-oxophosphonates are also activated ester/amide surrogates which exhibit unique characteristics: i) the electron-withdrawing phosphonate group activates the substrate towards nucleophilic attack, ii) the catalyst can bind to the phosphoryl and carbonyl oxygens leading to further activation and constraining to a welldefined orientation; and iii) the lability of the $C-P$ bond of $\mathbf{1}$ enables a facile nucleophilic cleavage for the transformation into the corresponding ester or amide 2 under mild conditions (Figure 12, a). The adjacent $C=O$ and $P=O$ groups have usually a dihedral angle of $180^{\circ}$; however, reorientation is possible in the presence of favorable interactions. Breuer et al. calculated the energy difference between the s-trans and s-cis conformations of the $C-P$ bond of dimethyl benzoylphosphonate $\mathbf{3}$ which was only of 1.8 kcal (Figure 12, b). ${ }^{53}$ All these characteristics make $\beta, \gamma$-unsaturated $\alpha$-oxophosphonates good Lewis/Brønsted acid acceptors and/or $H$-bond acceptors.

Acyl phosphonates were introduced as activated ester surrogates in asymmetric catalysis in 2003 by Evans in the Friedel-Crafts alkylation reaction of indoles promoted by organometallic complexes affording adducts 4 (Figure 12, c, 1). ${ }^{54}$ After this work, many groups reported the utility of these templates through an alternative activation strategy using bifunctional chiral catalysts. Jørgensen used for the first time these unsaturated acylphosphonates in asymmetric organocatalytic reactions promoted by bifunctional thioureas with three different carbon-centered nucleophiles (oxazolones, 1,3dicarbonyls and indoles), followed by acyl substitution with alcohols or amines to give esters and amides 5-7 in one pot and very good stereoselectivity (Figure 12, c, 2). ${ }^{55}$ It is remarkable that the use of azlactones and 1,3-dicarbonyl compounds as pronucleophiles

[^14]provides Michael adducts 6 and 7 wherein a tetrasubstituted stereocenter is generated efficiently, being this the only example of the creation of tetrasubstituted stereocenters with acyl phosphonates as templates.

This strategy has been extended to other nucleophiles, such as naphthoquinones ${ }^{56}$ and 4-hydroxylcoumarins ${ }^{57}$ which provide novel optically active chemicals with potent pharmacological properties. The usefulness of these templates has also been demonstrated in other organocatalytic reactions. ${ }^{58}$

### 1.3.1.2. Carbon-linked templates

Efficient carbon-linked templates have also been reported as acceptors in Michael addition reactions. The most representative ones are described below.

### 1.3.1.2.1. $\beta, \gamma$-Unsaturated $\alpha$-ketoesters and 3-methyl-4-nitro-5-alkenyl-isoxazoles

$\beta, \gamma$-Unsaturated $\alpha$-ketoesters (Figure 13, a) have a specific advantage as templates due to the presence of a further carboxylic function attached to the carbonyl group which enables a robust coordination to a Lewis acid or a hydrogen donor catalyst. This coordination increases the reactivity which makes them a recurring class of substrates in many types of asymmetric reactions in both metal-based and organocatalysis. ${ }^{59}$ Among them, Michael and aldol reactions, Diels-Alder reactions, several type of cycloadditions, intramolecular reactions, carbonyl reductions, alkylation and arylation reactions are found. Several chiral complex catalysts (Lewis acids) and organocatalysts ((thio)-urea, pyrrolidine derivatives, cinchona-based structures, Binol- or Binap-based Brønsted acids) have been reported to induce enantioselectivity in a variety of reactions with these templates.

[^15]

Figure 13. $\beta$, $\gamma$-Unsaturated $\alpha$-ketoesters and 3-methyl-4-nitro-5-alkenyl-isoxazoles as Michael acceptor templates.

The first use of $\beta, \gamma$-unsaturated $\alpha$-ketoesters was reported by Jørgensen in 2003 in the metal-promoted Michael addition of 4-hydroxycoumarins. ${ }^{60}$ Seven years later, Wang described the same reaction but making use of a thiourea-based organocatalyst ${ }^{61}$ and soon after, many groups published the use of different thiourea ${ }^{62}$ and squaramide ${ }^{63}$ bifunctional quinine derivatives ${ }^{64}$ for the same reaction due to the importance of 3 -substituted 4 hydroxycoumarins as biologically active compounds. Bifunctional thiourea catalysts were also found to efficiently promote the Michael addition of various carbon-nucleophiles such as 3-oxo-3-phenylpropanenitrile, ${ }^{65}$ malonitrile, ${ }^{66}$ trifluoroacetyl- $\beta$-oxo derivatives, ${ }^{67}$ 1,2 -cyclohexandione ${ }^{68}$ and $N$-(pyrrolidin-1-yl)methanimine ${ }^{69}$ to $\beta, \gamma$-unsaturated $\alpha$ -

[^16]ketoesters. Although, $\beta, \gamma$-unsaturated $\alpha$-ketoesters have been exploited with a variety of nucleophiles, to the best of our knowledge, the creation of tretrasubstituted stereocenters in $\beta$ - and/or $\gamma$-position remains unrealized.

3-Methyl-4-nitro-5-alkenyl-isoxazoles (Figure 13, b) constitute a valuable synthetic alternative to esters in procedures that require a tuning of the acceptor electrophilicity. These substrates posses a rigid heterocyclic framework linked to an exocyclic nitro group and may be considered as a nitrodiene system, which have been employed as cinnamate equivalents showing high reactivity towards stabilized (soft) nucleophiles. The first example of the use of 3-methyl-4-nitro-5-alkenyl-isoxazoles as Michael acceptors was reported by Adamo and Bernardi in the 1,4-addition of nitromethane under phase transfer catalysis conditions. ${ }^{70}$

Later, various groups envisaged the utilization of hydrogen bonding-tertiary amine type bifunctional catalysts (thioureas and squaramides) for the activation of both electrophile and nucleophile. ${ }^{71}$ With this methodology Wang demonstrated that the bifunctional squaramide $\mathbf{C 4}$ was also efficient in the asymmetric vinylogous 1,6-Michael addition of $\alpha, \beta$-unsaturated $\gamma$-butyrolactams obtaining adducts with excellent yields and enantioselectivities (Figure 13, b, 1). ${ }^{72}$ Other examples of the use of these Michael acceptors in a domino Michael/cyclization reaction ${ }^{73}$ and in [4+2] cycloadditions with dienals have also been reported. ${ }^{74}$

The final Michael adducts obtained from $\alpha$-ketoesters and 3-methyl-4-nitroisoxazoles can be converted into a variety of compounds (Scheme 5). The resulting $\gamma$ - or $\beta, \gamma$-functionalized $\alpha$-ketoesters $\mathbf{8}$ can be subjected to different transformations such as the oxidative decarboxylation ${ }^{75}$ or diastereoselective reduction of the $\alpha$-carbonyl ${ }^{76}$ to afford

[^17]the corresponding esters 9 and 10 (Scheme 5, a). Additionally, the presence of a carboxylate group attached to the carbonyl carbon atom enables also cyclization reactions. The 3-methyl-4-nitro-isoxazol moiety in adducts $\mathbf{1 1}$ can also be easily removed under mild conditions to provide carboxylic acids $\mathbf{1 2}$ and/or esters 13 (Scheme 5, b).

b)

### 1.3.1.2.2. $\alpha$ '-Hydroxy enones

Research from this laboratory has revealed that achiral $\alpha$ '-oxy ketones, and particularly $\alpha^{\prime}$-hydroxy enones, are outstanding bidentate achiral templates for efficient asymmetric catalysis. ${ }^{77}$ The presence of a pendant hydroxyl group in $\alpha$ '-hydroxy enones is the key for successful applications of such substrates as carboxylate equivalents in asymmetric synthesis. This unique scaffold enables a bidentate coordination with the catalyst and furthermore, provides a readily cleavable $C-C$ ketol/diol system which under suitable conditions releases the corresponding carboxylic acid, aldehyde or ketone depending on the reaction conditions.

Heathcock ${ }^{78}$ and Masamune ${ }^{79}$ employed for the first time $\alpha$-hydroxy enones in asymmetric $C-C$ bond forming reactions as chiral auxiliaries in early 80 's.

[^18]Complementing previous work, our group designed the camphor-derived $\alpha^{\prime}$-hydroxy enones $\mathbf{1 4}$ which efficiently participate in diastereoselective Michael, ${ }^{80}$ Diels-Alder ${ }^{81}$ and cycloaddition reactions (Scheme 6). ${ }^{82}$

Scheme 6. Michael, Diels-Alder and cycloaddition reactions described by our group with camphor-derived $\alpha$ '-hydroxy enone 14 .

Later, our group also demonstrated the efficiency of the $\alpha$-hydroxy ketone moiety in various metal catalyzed asymmetric transformations which are depicted in Scheme 7. These involve on the one hand, copper promoted cycloaddition reactions as Diels-Alder ${ }^{83}$ and nitrone-alkene 1,3-dipolar cycloadditions ${ }^{82}$ (Scheme 7, a and b). On the other hand, different efficient 1,4-additions of several nucleophiles as carbamates, ${ }^{84}$ pyrroles/indoles

Scheme 7. Metal-catalyzed asymmetric transformations using $\alpha^{\prime}$-hydroxy enones as Michael acceptors.

After this work other metal-catalyzed reactions which make use of $\alpha$ '-hydroxy enones in Michael reactions of diethyl zinc ${ }^{88}$ and $N, N$-dialkylhydrazones as source of acyl

[^19]anions (umpolung) or cyanide equivalents have also been reported. ${ }^{89} \alpha^{\prime}$-Hydroxy enones have also been investigated in catalytic asymmetric reactions promoted by chiral NHC catalysts ${ }^{90}$ and in Michael additions following a radical pathway. ${ }^{91}$

Another interesting aspect of these achiral templates is that the elaboration of the Michael adducts can be performed under smooth oxidative conditions as shown in Scheme 8. These transformations are compatible with a variety of organic functionalities affording interesting products such as carboxylic acids, aldehydes and ketones.

Scheme 8. Transformation of the Michael adducts coming from the reaction with $\alpha, \beta$-unsaturated $\alpha^{\prime}$ hydroxy enones.

With these precedents it is clear the excellent ability of the ketol moiety for both 1,4-metal and 1,4-proton bidentate binding in metal and Brønsted acid catalyzed asymmetric reactions (Figure 14). ${ }^{92}$ One structural feature of the 1,4 -chelate (fivemembered ring) in $\alpha^{\prime}$-hydroxy enones is that the most probable conformation is highly planar with both $C-O$ bonds eclipsed, thereby permitting optimum intramolecular hydrogen bonding. ${ }^{93}$ However, when the work for this PhD Thesis started no precedent on the efficiency of these $\alpha^{\prime}$-hydroxy enones in organocatalysis had been described.

[^20]

Figure 14. 1,4-Metal and 1,4-proton binding patterns of the ketol moiety.

Another relevant aspect of a potentially useful template is its accessibility. In this respect, there are several routes to synthesize $\alpha^{\prime}$-hydroxy enones from raw materials following straight and robust procedures. Among them are: aldol condensation of commercially available 3-hydroxy-3-methyl-2-butanone $\mathbf{1 5}$ and aldehydes (Scheme 9, a); ${ }^{94}$ Horner-Wadsworth-Emmons olefination from $\beta$-keto phosphonates $\mathbf{1 6}$ (Scheme 9, b); ${ }^{95}$ nucleophilic addition of a lithium methoxyallene $\mathbf{1 7}$ to acetone followed by a smooth hydrolysis (Scheme 9, c); ${ }^{83}$ and Heck reaction and cross metathesis from $\mathbf{1 8}$ using Grubbs catalysts (Scheme 9, d).

Scheme 9. General methods for the preparations of $\alpha^{\prime}$-hydroxy enones.

### 1.3.2. Michael donor templates

Many efforts have also been devoted to the search for appropriate Michael donor templates, especially for suitable pronucleophiles for soft enolization. In this context, catalytic asymmetric synthesis based on simple esters or carboxylic acid derivatives as nucleophiles is still challenging. Direct asymmetric transition-metal based Michael

[^21]approaches are well developed for carbonyl compounds bearing activating electronwithdrawing groups at the $\alpha$-position. However, organocatalytic approaches rely on pronucleophiles such as simple ketones and aldehydes via in situ enamine formation or relatively acidic carbonyl compounds for soft enolization in Brønsted base-promoted catalysis.

One option to solve this problem has been the introduction of electronwithdrawing groups in the $\alpha$-position to an ester or equivalent functionality, as for instance the use of $\alpha$-cyanoacetates ${ }^{96}$ and half-thioesters. ${ }^{97}$ Other alternative is the use of activated ester surrogates as masked equivalents of the desired products. In this context, some strategies have been recently developed for the asymmetric construction of $\alpha$-substituted carboxylic acid derivatives by using various acyclic and cyclic activated ester/amide surrogates.

### 1.3.2.1. Acyclic Michael donors

With the aim of searching mild reaction conditions for the direct asymmetric $C-C$ bond formation involving carboxylic acid equivalents, various new pronucleophiles have been designed. In these studies some features for the development of efficient Michael donors are considered (Figure 15); on the one hand, the introduction of an appropriate activating group is of great importance since it should engender an amide/ester surrogate of low $\mathrm{p} K_{\mathrm{a}}$ that would facilitate enolization. On the other hand, this activating group should also serve as director for enhancing stereocontrol and reactivity; and finally it should also act as a good leaving group for subsequent transformations.

Figure 15. General characteristics of activated ester/amide surrogates.

Direct organocatalytic methods based on amine catalysis under proton-transfer conditions have a functional $\mathrm{p} K_{\mathrm{a}}$ barrier for nucleophile activation that lies between the

[^22]$\mathrm{p} K_{\mathrm{a}}$ values of 16 and 17 (Figure 16). It is known that diethyl malonate with a $\mathrm{p} K_{\mathrm{a}}$ value of 16.4 can be activated by amine bases to act as a nucleophile, but ketones with $\alpha$-carbon $\mathrm{p} K_{\mathrm{a}}$ values of ca. 18 require amine activation by enamine formation. Some experiments carried out by Um and Drueckhammer ${ }^{98}$ showed that the change from an oxyphenol ester to a thiophenol ester results in a reduction in the $\mathrm{p} K_{\mathrm{a}}$ value of the $\alpha$-carbon of an ester by approximately 2 units, just at the borderline for nucleophile activation using the currently available amine organocatalysts. ${ }^{99}$ Moreover, experiments carried out with trifluoroethyl thioesters suggested that the $\mathrm{p} K_{\mathrm{a}}$ value might be close to those of malonate diesters, making them candidate ester nucleophiles.

16.4

Figure 16. $\mathrm{p} K_{\mathrm{a}}$ Values of the $\alpha$-carbons of some pronucleophiles in DMSO. ${ }^{100}$

The most representative acyclic activated ester/amide surrogates described in the literature are depicted in Scheme 10 and involve trifluoroethyl thioesters 19, pyrazoleamides 21, $\alpha$-ketophosphonates 24 and acylsilanes 26. Their main characteristics and properties are described below.

Taking advantage of the lower $\mathrm{p} K_{\mathrm{a}}$ value of trifluoroethyl thioesters 19, Barbas III reported for the first time strategies based on the use of this type of Michael donors as pronucleophiles in organocatalytic reactions (Scheme 10, a). ${ }^{101}$ The versatility of the trifluoroethyl thioester system was explored in organocatalytic asymmetric Michael reactions involving $\alpha, \beta$-unsaturated aldehydes. The trialkylsilyl-protected diaryprolinol catalyst $\mathbf{C 8}$ together with benzoic acid as co-catalyst provided the Michael adducts $\mathbf{2 0}$ from $\alpha, \beta$-unsaturated aldehydes in good chemical yield, moderate diastereoselectivity and good enantioselectivity. ${ }^{102}$ Nevertheless, one of the drawbacks of this approach is the cost

[^23]of the trifluoroethanethiol amount that is required for the synthesis of the starting material and the fact that diastereoselectivity of these reactions is modest.
a)

Scheme 10. Representative reactions carried out with acyclic ester/amide surrogates. a) Trifluoroethyl thioesters. b) Pyrazoleamides. c) $\alpha$-Ketophosphonates. d) Acylsilanes. e) Structure of the catalysts employed in the above examples.

Some years later, the same group reported the use of pyrazoleamides 21 as amide pronucleophiles for the Michael reaction with nitrostyrenes catalyzed by the quinine derived bifunctional urea C9 (Scheme 10, b). ${ }^{103}$ They hypothesized that the aromatic properties of the pyrazoleamide would provide a relatively low $\mathrm{p} K_{\mathrm{a}}$ value facilitating enolization with weak amine bases. Furthermore, the pyrazoleamide moiety served as a directing group through hydrogen bonding to the catalyst for enhancing stereocontrol and as a good leaving group for subsequent transformations. ${ }^{104}$ In this case, the Michael adducts $\mathbf{2 2}$ were obtained with excellent and very good diastereo- and enantioselectivities and were then transformed into the corresponding esters 23 while maintaining the stereoselectivity. Despite the fact that excellent results were achieved, the electronic nature of the $\alpha$-substituent on the nucleophile ( $\mathrm{R}^{1}$ ) has a major influence on the reactivity of this reaction. Whenever there is an electron-donating group, the yield is modest.

On the other hand, it is known that the $\alpha$-ketophosphonate group can be easily converted into an ester or amide group. Taking advantage of this fact, in 2013 Zhao reported the first organocatalyzed asymmetric Michael reaction of $\beta$-aryl- $\alpha$ ketophosphonates 24 with nitroalkenes using the chiral bifunctional Brønsted base catalyst C10 (Scheme 10, c). ${ }^{105}$ The $\alpha$-ketophosphonate group in the final Michael adducts was in situ converted into an amide group through aminolysis to give the corresponding $\alpha, \beta$-disubstituted $\gamma$-nitroamides 25 in high yields and good stereoselectivities. The same group employed $\alpha$-ketophosphonates $\mathbf{2 4}$ for aldol reactions leading to isatins. ${ }^{106}$

A stronger activation strategy of carboxylic acid surrogates has been employed by Yu and Tang in the Michael addition of acylsilanes 26 to nitroalkenes (Scheme 10, d). ${ }^{107}$ Due to their slightly higher $\mathrm{p} K_{\mathrm{a}}$ values compared with aldehydes, ketones and 1,3dicarbonyl compounds, the $\alpha$-alkylation of acylsilanes $\mathbf{2 6}$ is more difficult. To overcome this problem the use of a stronger base is necessary. This formal acylsilane $\alpha$-alkylation in the presence of the chiral guanidine $\mathbf{C 1 1}$ affords products $\mathbf{2 7}$ in good yields and high diastereo- and enantioselectivity. The corresponding adducts 27 can be converted into carboxylic acids 28 whose further reaction with thionyl chloride affords the corresponding esters.

[^24]Remarkably, all the examples reported with these acyclic Michael donor templates involve the creation of a tertiary stereocenter. To the best of our knowledge, no examples of the creation of a tetrasubstituted stereocenter have been described.

### 1.3.2.2. Heterocyclic Michael donors

Apart from acyclic substrates several different heterocyclic compounds containing enolizable ester/amide groups have been described. Some of them are part of biologically active compounds, and others have also been employed as carboxylic acid surrogate pronucleophiles involving the creation of a new tetrasubstituted stereocenter. The most representative heterocycles of this type are shown in Figure 17.

In general, these heterocycles show very interesting characteristics: i) easy deprotonation under soft enolization conditions (aromatic enolate formation, except for rhodanines and piperazin-2,3,6-triones); ii) the geometry of the resulting starting enolate or equivalent is fixed due to their cyclic nature, thus facilitating the control of the stereoselectivity; iii) they are substituted at the $\alpha$-position of the carbonyl and therefore after reaction with an electrophile a new tetrasusbtituted stereocenter is created; and iv)
some of them after the enantioselective reaction with an electrophile, can be opened under appropriate conditions to afford $\alpha$-mercapto, $\alpha$-hydroxy and $\alpha$ - or $\beta$-amino acid derivatives with a tetrasubstituted stereocenter.

### 1.3.2.2.1. Oxindoles and benzofuran-2(3H)-ones

Among the most used heterocycles as pronucleophiles are oxindoles ${ }^{108}$ and benzofuran-2(3H)-ones. ${ }^{109}$ Both structures have an ester or amide functionality but their $\mathrm{p} K_{\mathrm{a}}$ values are much lower than their parent ester or amide acyclic compounds. In both cases, the depronation of the $\alpha$-carbon is favored due to the formation of an aromatic enolate. The most versatile methodology to construct the tetrasubstituted carbon stereocenter at the $C-3$ position of the oxindole or benzofuranone framework is based on the reaction of these prochiral 3-substituted substrates with different electrophiles (Scheme 11). This methodology allows the generation of the desired tretrasubstituted carbon stereocenter with all carbon substituents or with a heteroatom substituent.

Scheme 11. Construction of a tetrasubstituted stereocenter in oxindoles and benzofuran-2(3H)-ones by Brønsted base catalysts.

The ionization of oxindoles in organic solvents may occur readily at both nitrogen and carbon, suggesting potentially similar reactivity of nitrogen and carbon in unsubstituted oxindoles. ${ }^{110}$ Regarding the $\mathrm{p} K_{\mathrm{a}}$ values of this type of substrates, unsubstituted oxindole $\mathbf{3 0}$ (Figure 18) has a $\mathrm{p} K_{\mathrm{a}}$ value of 18.2 and the $\mathrm{p} K_{\mathrm{a}}$ values of 3-alkyl-substituted oxindoles are expected to be substantially higher. Nevertheless, the $\mathrm{p} K_{\mathrm{a}}$ value of 3 -alkyl substituted oxindoles might be significantly influenced by the N protecting group. As shown in Figure 18, the $\mathrm{p} K_{\mathrm{a}}$ value of $N$-methyloxindole 29 can be lowered down from 18.2 to 13.0 by the introduction of a carbonyl group ( $N$-acetoxy derivative 31). In the light of this, most employed methods use $N$-Boc-3-substituted

[^25]oxindoles as substrates in base-promoted reactions for three reasons: i) they exhibit suitable $\mathrm{p} K_{\mathrm{a}}$ value for deprotonative activation; ii) this group suppresses nucleophilic attack from the $N$; and, iii) they show bulkier steric hindrance and bidentate coordination to the catalyst for better stereocontrol. On the other hand, benzofuran-2(3H)-one (32, Figure 18) has a relatively lower $\mathrm{p} K_{\mathrm{a}}$ value (13.5) comparing with oxindoles, thus allowing easy deprotonation.

$\begin{array}{ll}\mathrm{p} K_{\mathrm{a}} & 18.5\end{array}$

Figure 18. Reactivity patterns and $\mathrm{p} K_{\mathrm{a}}$ values in $\mathrm{DMSO}^{100}$ of oxindoles $\mathbf{2 9} \mathbf{- 3 1}$ and benzofuran-2(3H)-one 32.

Many methods have been developed with 3-susbtituted oxindoles as pronucleophiles for the stereoselective construction of tetrasubstituted carbons. The main reason of this development is that the oxindole framework bearing a tetrasubstituted carbon stereocenter at the 3-position is the core of a large family of bioactive natural products and a series of pharmaceutically active compounds. ${ }^{111}$ These substrates have been employed in many asymmetric catalytic reactions which have been comprehensively reviewed ${ }^{108}$ and will not be discussed here.

Furthermore, the Michael addition of 3-substituted oxindoles to electron-deficient olefins not only provides an efficient method to construct a quaternary stereocenter at the 3-position, but can also be used in the synthesis of 3,3 '-spirooxindoles because the electron-withdrawing group of the acceptor can be further utilized for ring formation. ${ }^{112}$

${ }^{112}$ For reviews on spirooxindoles synthesis, see: a) Cheng, D.; Ishihara, Y.; Tan, B.; Barbas III, C. F. ACS Catal. 2014, 4, 743-762. b) Hong, L.; Wang, R. Adv. Synth. Catal. 2013, 355, 1023-1052. c) Trost, B. M.; Brennan, M. K. Synthesis 2009, 18, 3003-3025.

Examples of the Michael addition of 3 -substituted oxindoles to enones have been described through different modes of activation. ${ }^{113}$ However, Brønsted base promoted reaction of 3 -substituted oxindoles to enones has met limited success except for the 3benzyl derivatives, as shown by the reports of Luo and Cheng in reactions promoted by a bifunctional thiourea based Brønsted base. ${ }^{114}$

Benzofuran-2(3H)-ones have been less exploited than oxindoles in Michael addition reactions; however, the enantioselective synthesis of chiral benzofuran-2(3H)ones has attracted great attention among synthetic chemists because this scaffold bearing a quaternary stereogenic center at the $C-3$ position can be found in a number of biologically active heterocyclic compounds. ${ }^{115}$

The most versatile methodology to construct the quaternary carbon center at the $C-3$ position of the benzofuranone framework is based on the reaction of 3 -substituted prochiral benzofuranones with different electrophiles, including aldol and Mannich reactions, allylic alkylations, aminations, fluorinations, Michael and domino reactions which have been recently reviewed. ${ }^{109}$ However, here again, as in the case of 3substituted oxindoles, the Michael addition to enones, which involves the generation of a tetrasubstituted stereocenter, has met limited success and moderate results have been reported. ${ }^{116}$

[^26]
### 1.3.2.2.2. Rhodanines

Rhodanines $\mathbf{3 3}$ are heterocycles which have been scarcely used as pronucleophiles in asymmetric catalysis. ${ }^{117}$ Only few examples have been reported which involve the use of enones $\mathbf{3 4},{ }^{118}$ enals $\mathbf{3 6}{ }^{119}$ and azodicarboxylates $\mathbf{3 8}{ }^{120}$ as electrophiles (Scheme 12). The reaction with enones $\mathbf{3 4}$ is promoted by the chiral primary amine $\mathbf{C 1 2}$ and the corresponding Michael adducts $\mathbf{3 5}$ are obtained from moderate to excellent yields and enantioselectivities (Scheme 12, a); in the case of enals 36, catalyst C13 has been employed for the construction of sulfur-containing spirocyclic compounds 37 with good results (Scheme 12, b). Moreover, the $\alpha$-amination reaction with azodicarboxylates 38 promoted by quinine C14 afford adducts $\mathbf{3 9}$ with excellent yields and enantioselectivities (Scheme 12, c).

[^27]
### 1.3.2.2.3. Piperazin-2,3,6-triones

2,5-Diketopiperazines (Figure 19) are useful starting materials for the generation of structural diversity and complexity in the field of heterocyclic compounds. There are broad applications of these heterocycles in the synthesis of many types of bioactive compounds such as several families of alkaloids ${ }^{121}$ which, in turn, are also valuable precursors of $\alpha$-amino acids derivatives. ${ }^{122}$ Olenyuk's group reported the only two enantioselective examples of 2,5 -diketopiperazines as pronucleophiles; an $\alpha$-sulfenilation reaction ${ }^{123}$ and an alkylation reaction. ${ }^{124}$ However, in both cases activated 2,5diketopiperazines are needed and total stereocontrol of the reaction is not achieved.

2,5-Diketopiperazines

2,3,6-Triketopiperazines

Figure 19. General structure of 2,5-diketopiperazines and 2,3,6-triketopiperazines.

Recently, Simpkins and co-workers employed under-explored triketopiperazines to access diketopiperazines in high enantioselectivity in a cinchona alkaloid catalyzed Michael addition to enones. ${ }^{125}$ However, the reaction is only efficient with 5unsubstituted and 5-methoxycarbonyl triketopiperazines ( $\mathrm{R}^{1}=\mathrm{H}, \mathrm{CO}_{2} \mathrm{Me}$ ). No examples involving aliphatic or aromatic $\mathrm{R}^{1}$ substituents have been reported to date. Reaction with chalcones also demonstrated to be efficient and adducts were transformed into 2,5diketopiperazine derivatives in high yields.

[^28]
### 1.3.2.2.4. Oxazolone, Thiazolone and Pyrazolone analogs

Many more examples of heterocyclic compounds of type of Scheme 13 have been described as pronucleophiles during the last years in asymmetric reactions with the simultaneous creation of tetrasubstituted carbons.

b)

X = O Oxazol-4(5H)-ones
X = S Thiazol-4(5H)-ones

Scheme 13. Oxazolones/thiazolones (a, b) and pyrazolones/isoxazolones (c) as pronucleophiles in asymmetric reactions.

In this context, examples of this type of heterocycles are oxazol-5(4H)-ones (or azlactones) and their thiazol-5(4H)-one analogs (Figure 20, a), as well as oxazol-4(5H)ones and their thiazol-4(5H)-one analogues (Figure 20, b). The addition adducts can be easily hydrolyzed to provide carboxylic acids or their derivatives carrying different functionalities ( $\alpha$-amino acids 40, $\alpha$-hydroxy acids 41 and $\alpha$-mercapto acids 42).

$\begin{array}{ll}X=O & \text { Oxazol- } 5(4 H) \text {-ones } \\ X=S & \text { Thiazol- } 5(4 H) \text {-ones }\end{array}$

nucleophilic at $\mathrm{C} \alpha$ only

Figure 20. Some $\alpha$-susbtituted oxazolone and thiazolone derivatives for asymmetric catalysis, their reactivity patterns against enolization, and resulting adducts after catalytic reaction and hydrolysis.

Oxazol-5(4H)-ones or azlactones (Figure 20, a, $\mathrm{X}=\mathrm{O}$ ) and their sulfur analogs thiazol-5(4H)-ones (Figure 20, a, $\mathrm{X}=S$ ) exhibit multiple reactive sites, which make them excellent substrates for the synthesis of highly substituted scaffolds. The acidity of $C-4$ $\left(\mathrm{p} K_{\mathrm{a}} \approx 9\right)^{126}$ allows the easy formation of an oxazole enolate, which can react with a range of electrophiles. Upon enolization the reaction with an electrophile can occur either at the $\alpha$ - or $\gamma$-position. This can generate problems of regioselectivity depending on the reaction conditions and/or type of substituents. However, oxazol-4(5H)-ones (Figure 20, b, X = O) and their sulfur analogs thiazol-4( $5 H$ )-ones (Figure 20, b, $\mathrm{X}=S$ ) upon enolization only exhibit one nucleophilic position at the $\alpha$-carbon to the carbonyl. Here the regioselectivity problem is avoided. All these types of heterocycles have been used in asymmetric catalysis promoted by chiral Brønsted bases in reactions which generate tetrasubstituted carbons.

The first developed pronucleophiles of this type are oxazol-5-(4H)-ones or azlactones, which have been deeply investigated and reviewed. ${ }^{127}$ Michael reactions concerning these substrates will be discussed in Chapter 2. Structurally related thiazol$5(4 H)$-ones are associated with several biological active compounds ${ }^{128}$ and the first

[^29]organocatalytic asymmetric reaction with these substrates was described by Ooi in a highly stereoselective Mannich-type reaction. ${ }^{129}$ Later, more examples of Mannich ${ }^{130}$ and Michael reactions to nitroalkenes ${ }^{131}$ and electron-deficient alkynes ${ }^{132}$ have been developed.

On the other hand, since the pionnering work by Trost in 2004, ${ }^{133}$ several examples of the utility of the structurally related oxazol-4(5H)-ones (Figure 20, b, $\mathrm{X}=\mathrm{O}$ ) have also been published, ${ }^{134}$ which involve mainly Michael additions (to enones, nitroalkenes, alkynones and vinyl sulfones), $\gamma$-additions to allenoates, 1,6-additions to conjugated dienones, aldol/Mannich reactions, $\alpha$-sulfenylation reactions and alkylations. Concerning the Michael reaction to enones, to the best of our knowledge, only 5-alkyl 2aryl oxazol- $4(5 \mathrm{H})$-ones have been employed in these reactions and no examples of the use of 5-aryl derivatives as pronucleophiles have been reported. ${ }^{135}$

Sulfur (thiazol-4(5H)-ones, Scheme 14) analogues of these oxazol-4(5H)-ones have been well known for a long time and have found several applications in pharmaceutical and medicinal chemistry. ${ }^{136}$ These compounds are readily accessible and in turn, can be suitable donors for asymmetric catalytic reactions. In these cases the hydrolysis of the adducts coming from an asymmetric reaction can provide $\alpha$-mercapto acids. It has been shown by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ that these compounds exist as an equilibrium in

solution between the two tautomeric forms (Scheme 14), ${ }^{137}$ and therefore this could facilitate deprotonation at the 5-position to further react with various electrophiles.

Scheme 14. Equilibrium between enol and keto form of thiazolones.

In spite of this, and although structurally related to oxazol-4(5 H )-ones and oxazol$5(4 H)$-ones, this thiazol- $5(4 H)$-ones have been rarely used until now in asymmetric catalysis, and only very recently three interesting examples describing their applications in this area have been reported. ${ }^{138}$ Our group described the first application of these compounds in the conjugate addition to nitroalkenes which worked efficiently in the presence of the new ureidopeptide-like Brønsted base catalyst C15. ${ }^{139}$ The $\alpha$-amination reaction of these substrates with tert-butyl azodicarboxylate in the presence of ureidopeptide-like catalyst C16 also afforded very good results.

Scheme 15. Highly enantioselective reactions of thiazol-4(5H)-ones as pronucleophiles promoted by ureidopeptide-like bifunctional Brønsted base catalysts. a) Michael addition to nitroalkenes. b) $\alpha$ Amination.

[^30]Another type of heterocyclic scaffolds are pyrazol-5(4H)-ones ${ }^{140}$ (Figure 21, $\mathrm{X}=$ $N R^{3}$ ) and isoxazol-5(4H)-ones (Figure $21, \mathrm{X}=O$ ) and their tautomerism has been investigated by various groups. ${ }^{141}$ Both compounds have attractive pharmacological properties ${ }^{142}$ and are valuable building blocks which would permit a rapid access to $\beta$ amino acids. ${ }^{143}$ Despite the value of these compounds for pharmaceutical sciences and organic synthesis, little is known about the enantioselective preparation of chiral derivatives. One reason seems to be that alkylation of isoxazolinones via the corresponding enolates suffers from low regioselectivity due to the competition of nucleophilic $C, N$ and $O$ centers, which all of them can react with electrophiles (Figure 21). ${ }^{144}$

nitroolefins. After this work some more examples of the use of these substrates in Michael addition, amination and alkylation reactions have been published. In the case of isoxazol- $5(4 H)$-ones there are only three reports on their use as pronucleophiles. ${ }^{145}$ However, it is worth to mention that regarding the Michael addition of pyrazol-5(4H)ones ${ }^{146}$ and isoxazol- $5(4 H)$-ones ${ }^{145 \mathrm{~b}}$ to $\alpha, \beta$-unsaturated ketones two examples have been only reported both promoted by metal catalysts. In both cases, the adducts are obtained with excellent results but in the case of pyrazol-5(4H)-ones activated enones are required.

### 1.3.2.2.5. $\alpha, \beta$-Unsaturated $\gamma$-butyrolactams and butenolides

$\alpha, \beta$-Unsaturated $\gamma$-butyrolactams and butenolides have emerged as the most attractive reactants in asymmetric organometallic or organocatalytic reactions for the synthesis of chiral $\beta$ - and $\gamma$-functionalized pyrrolidin-2-ones and furan-2-ones. These structural motifs are present in a variety of bioactive compounds and are prodigious building blocks (Figure 22). ${ }^{147}$

$X=N^{2} \quad \alpha, \beta$-unsaturated $\gamma$-butyrolactam
$\mathrm{X}=\mathrm{O} \quad \gamma$-butenolide

(-)-Trachelogenin

Figure 22. General structure of $\alpha, \beta$-unsaturated $\gamma$-butyrolactams and $\gamma$-butenolides and some biologically active compounds.

Owing to their synthetic significance, intense efforts have been made to extend the structurally diverse substituted butyrolactams (Scheme 16). $\alpha, \beta$-Unsaturated $\gamma$ butyrolactams have been mainly employed as vinylogous nucleophiles to perform Michael additions to form tertiary stereocenters as has been collected in various extensive

[^31]reviews. ${ }^{148}$ Moreover, there are some examples involving the asymmetric catalyzed 1,4addition introducing $C-4$ chirality at the $\beta$ position, but in all cases these heterocycles are acting as electrophiles. ${ }^{149}$ In contrast, the reaction at the $\alpha$-position of $\alpha, \beta$-unsaturated $\gamma$ butyrolactam with electrophiles is rare and only a few examples have been reported. ${ }^{150}$

Scheme 16. Different reaction positions of $\alpha, \beta$-unsaturated butyrolactams.

Two groups have described the Michael addition of $\alpha, \beta$-unsaturated butyrolactams to enones and $\beta$-activated acrylates in organocatalysis. ${ }^{151}$ In 2011 Wang reported the vinylogous Michael reaction of these substrates to chalcones promoted a bifunctional thiourea catalyst. Excellent results were obtained but the methodology failed with $\beta$-alkyl substituted enones. Later, Lin employed the same catalyst for the conjugate addition to enones and $\beta$-acyl acrylates affording adducts with good stereocontrol.

Many different vinylogous reactions have been developed with $\gamma$-butenolides that have also been collected in a review. ${ }^{152}$ Structurally similar $\gamma$-substituted deconjugated butenolides have gained attention due to their potential for the construction of the same products 43 obtained from $\gamma$-butenolides containing a $\gamma$-quaternary stereocenter (Scheme 17). It is noteworthy to mention that at the outset of this research area instead of using

[^32]directly $\gamma$-butenolides as pronucleophiles, many reactions were described with 2 silyloxyfurans, ${ }^{153}$ probably because of their higher reactivity.

## Scheme 17.

Asymmetric allylic alkylation ${ }^{154}$ and vinylogous Mannich reaction ${ }^{155}$ have been achieved under either metal or organocatalytic conditions with these $\gamma$-substituted deconjugated butenolides. Direct organocatalytic Michael additions of these heterocycles to various electrophiles such as enals, ${ }^{156}$ nitroolefins ${ }^{157}$ and enoyl pyridines ${ }^{158}$ have also been reported. The vinylogous Michael addition of these substrates to 2-enoylpyridines affords the corresponding adducts in good yields and excellent stereocontrol in the presence of a squaramide-based bifunctional catalyst. In this approach the 2-pyridyl moiety has been found to be key for the obtention of high yields.

[^33]
### 1.4. Objectives

The previous precedents show that the use of carboxylic acid derivatives as Michael acceptors and donors in organocatalysis is challenging. There are not many examples of asymmetric catalytic reactions involving these substrates. The low acidity of the $\alpha$-carbon of the ester group complicates efficient deprotonation with typical weak chiral amines. Additionally, the low reactivity of $\alpha, \beta$-unsaturated ester/amides as Michael acceptors, further illustrates the need of new surrogates. On the other hand, Michael additions of carbon nucleophiles to enones or $\alpha, \beta$-unsaturated esters involving the generation of a tetrasubstituted stereocenter have also found limited success.

In this context and, as mentioned before, our group reported the efficiency of $\alpha^{\prime}$ oxy enones as Michael acceptor templates in various metal catalyzed asymmetric reactions. They showed higher innate reactivity than most ester surrogates and the resulting addition adducts were easily converted into carboxylic acids, aldehydes and ketones. However, at the beginning of the research work for this Thesis, the use of these types of acceptors had not been investigated in organocatalysis.

Inspired by these precedents, we hypothesized that $\alpha^{\prime}$-oxy enones could be efficient $\alpha, \beta$-unsaturated ester surrogates in asymmetric reactions promoted by Brønsted base organocatalysts. So the first goal of this work was to check the efficiency of these templates as Michael acceptors in the reaction with carbon-nucleophiles promoted by bifunctional Brønsted base catalysts, while simultaneously generating tretrasubstituted stereocenters. The corresponding Michael adducts could then be converted into the analog esters and ketones, thus given access to derivatives otherwise not accessible through direct conjugate addition. More specifically, the pronucleophiles chosen for this first objective were $\alpha$-substituted cyanoacetates 44 and azlactones 46 (Scheme 18). The reasons of this choice as well as the corresponding results of this research are outlined in Chapter 2.

Scheme 18. First exploration of the utility of $\alpha^{\prime}$-oxy enones as Michael acceptors in organocatalysis.

On the other hand, the search for new efficient pronucleophiles in asymmetric catalysis still is another focus of interest. More specifically the finding of new heterocyclic pronucleophiles for organocatalytic reactions that promote simple access to carbonylic compounds with quaternary $\alpha-C\left(\mathrm{sp}^{3}\right)$ moieties has been the goal of several research groups throughout decades. In this context, the second goal of this work was to check the validity of pyrrolidin-2,3-diones as pronucleophiles in Brønsted base promoted catalytic reactions (Scheme 19). Specifically, pyrrolidin-2,3-diones 48 were selected as promising substrates since this heterocyclic scaffold is biologically interesting and precursor of $\beta$-amino acids, vide infra. To the best of our knowledge, these substrates have only been used in an iminium based asymmetric catalytic reaction to generate tertiary stereocenters. ${ }^{159}$ Due to the tautomerism of 4 -substituted pyrrolidin-2,3-diones bifunctional Brønsted bases were envisaged as ideal catalysts to deprononate them and provide chiral environment. In this instance, both $\alpha$ '-oxy enones 49 and azodicarboxylates 38 were the electrophiles of choice for this study.

Scheme 19. First investigations on the utility of 4-substituted pyrrolidin-2,3-diones as pronucleophiles in organocatalysis.

This synthetic plan presents some challenges because pyrrolidin-2,3-diones exhibit more than one reacting sites and there are some evidences of regioselectivity problems in alkylation reactions. ${ }^{160}$ The most interesting characteristic of the addition adducts $\mathbf{5 2}$ coming from these substrates is that they can be easily converted into the corresponding NCAs 53 for their direct incorporation into peptidic sequences and/or reaction with different nucleophiles (Scheme 20). All the results concerning the use of pyrrolidin-2,3-diones as pronucleophiles as well as the applications of the resulting adducts are collected in Chapter 3.

[^34]

Scheme 20. Applications of the Michael adducts coming from pyrrolidin-2,3-diones in peptide synthesis.

Finally, a short stay was carried out under the supervision of Prof. Mauro Adamo in The Royal Collegue of Surgeons in Ireland in the Pharmaceutical and Medicinal Department. The research project there was focused on the preparation of racemic benzylic chlorides $\mathbf{5 7}$ from racemic benzylic sulfides $\mathbf{5 5}$ with stoichiometric amounts of hypervalent iodine (Scheme 21). The corresponding results are presented in Chapter 4.

Scheme 21. Synthesis of racemic benzyl chlorides from benzylic sulfides through oxidative $C-S$ bond activation.

## 2. $\alpha^{\prime}$-Oxy enones as Michael acceptors in organocatalytic reactions

As mentioned in the previous chapter, one of the goals of this Thesis was to investigate the efficiency of $\alpha$ '-oxy enones as Michael acceptor substrates in organocatalytic asymmetric reactions. For that purpose, two types of enolizable carbonyl compounds (cyanoacetates 44 and azlactones 46) that have previously demonstrated to be challenging were selected (Figure 23). Moreover, a variety of $\alpha$ '-oxy enones with different substitution patterns (non-substituted, $\beta$-substituted and $\alpha$-substituted enones) were chosen as bidentate templates to investigate the Michael addition promoted by chiral bifunctional Brønsted base catalysts.

Figure 23. Proposed pronucleophiles to check the efficiency of $\alpha$ '-oxy enones in asymmetric Brønsted base catalyzed Michael reactions.

## 2.1. $\alpha$-Substituted cyanoacetates as Michael donors

The use of 2-cyano esters as pronucleophiles in asymmetric reactions provides direct access to highly functionalized chiral building blocks with different structural features. The versatility of both the carboxy and cyano group as precursors of different functional groups makes possible the enantioselective synthesis of different products such
as $\alpha, \alpha$-dialkylamino acids, ${ }^{161} \beta$-amino acids and $\beta$-lactams, ${ }^{162} \alpha, \beta$-diamino acids, ${ }^{163} \gamma$ amino acids ${ }^{164}$ and others ${ }^{165}$ (Scheme 22).

Scheme 22. Diversity of products obtained from chiral cyanoacetates.

Several different types of asymmetric reactions have been carried out with 2cyano esters which afford $\alpha$-functionalized derivatives with a new tetrasubstituted stereocenter. ${ }^{166}$ Among the reactions involving $\alpha$-carbon functionalization of these substrates, alkylations, ${ }^{167}$ allylic substitutions, ${ }^{168}$ Mannich ${ }^{169}$ and multicomponent

[^35]reactions ${ }^{170}$ have been reported, most of them promoted by chiral organocatalysts. Regarding $\alpha$-heteroatom functionalization, significant progress has been made in the organocatalytic $\alpha$-amination, ${ }^{171} \alpha$-phosphination ${ }^{172}$ and $\alpha$-fluorination ${ }^{173}$ reactions. However, the development of other $\alpha$-heteroatom functionalizations (oxidation, chlorination, bromination or sulfenylation) remains unexplored.

Cyanoacetates are incapable of two-point binding to the catalyst because of the linear geometry of the cyano group which affords less rigid and less organized transition states and hampers the differentiation of prochiral enol(ate) faces. To overcome this difficulty the most efficient methodology with these substrates has been a bifunctional activation mode (for example, dinuclear Lewis acid catalysis or a well-defined hydrogenbonding network) to activate both the cyanoacetate nucleophile and the electrophile.

Apart from a study by Wymberg and Helder in $1975{ }^{174}$ about the Michael addition of ethyl 2-phenyl-2-cyanoacetate to methyl vinyl ketone catalyzed by quinine, metal complexes were the only catalysts used to promote the conjugate addition of 2-cyano esters to activated olefins until 2005. Since then organocatalysts have taken the place of metal catalysts and some of the most representative results are summarized in Table 1.

[^36]Deng and co-workers described the first efficient organocatalyzed Michael addition of 2-methyl cyanoacetates to nitroalkenes (Table 1, a). ${ }^{175}$ Two contiguous stereogenic centers were created with excellent levels of enantio- and diastereoselectivity promoted by the cinchona derived catalyst C17. In light of the discovery of this type of catalysts as highly efficient in the reaction with nitroalkenes, the same group reported the enantioselective conjugate addition of 2-aryl-2-cyanoacetates to vinyl sulfones (Table 1, b). ${ }^{176}$ Nevertheless, 2-alkyl cyanoacetates were significantly less active and to overcome this lack of reactivity, the more electrophilic 3,5-bis-(trifluoromethyl)-phenyl vinyl sulfone was used as Michael acceptor. Furthermore, the efficiency of $\beta$-substituted $\alpha, \beta$ unsaturated sulfones as Michael acceptors was also demonstrated as the corresponding adducts were obtained in good yields and good to excellent levels of enantio- and diastereoselectivity.

Similar results were described by Chen in the addition reaction of 2 -substituted cyanoacetates to vinyl sulfones catalyzed by the chiral bifunctional thiourea $\mathbf{C 1 9}$ (Table 1, c). ${ }^{177}$ From good to excellent yields and excellent enantioselectivities were observed in the reaction of 2-aryl cyanoacetates with phenyl vinyl sulfone; however, 2-alkyl cyanoacetates required a more electrophilic sulfone (1,1-bis(phenylsulfonyl)ethane) to observe good reactivity ( $73-96 \%, 91-96 \% ~ e e)$.

Another type of Michael acceptor was studied later by Marini and co-workers (Table 1, d). Vinyl selenones turned out to be efficient substrates in the addition of 2-aryl-2-cyanoacetates catalyzed by $\mathbf{C 2 0}$ affording the Michael adducts in good to excellent yields, diastereo- and enantioselectivities. ${ }^{178}$ However, the reaction could not be extended to 2 -alkyl cyanoacetates due to their low reactivity. The reaction was also performed using $\beta$-substituted $\alpha, \beta$-unsaturated selenones as Michael acceptors and the corresponding adducts were obtained in moderate to good enantioselectivity. The synthetic versatility of the selenone moiety allowed its conversion into synthetically valuable chiral functional groups such as azide, bromide, iodide and alkene.

Deng and co-workers were also the firsts to describe the organocatalytic asymmetric conjugate addition of 2-substituted cyanoacetates to enals (Table 1, e). ${ }^{179}$ The

[^37]corresponding Michael adducts coming from the reaction of 2-aryl and 2-heteroaryl cyanoacetates with acrolein ${ }^{180}$ were obtained with excellent yields and enantioselectivities employing the modified cinchona catalyst C21.

In 2011, Yan ${ }^{181}$ and Yuan ${ }^{182}$ reported almost at the same time the organocatalytic asymmetric Michael reaction of 2-aryl cyanoacetates with maleimides ${ }^{183}$ promoted by the thiourea-based catalyst $\mathbf{C 2}$ (Table 1, f) demonstrating that this was a useful tool for the asymmetric synthesis of chiral succinimide derivatives. However, in the same reaction aliphatic cyanoacetates reacted with decreased stereoselectivity (52:48-69:41 dr; 68-71\% $e e)$.

Organocatalytic phase-transfer conditions have also been checked in the conjugate reaction of $\alpha$-alkyl cyanoacetates with alkynyl ketones and alkynyl esters by Maruoka (Table 1, g). ${ }^{184}$ High enantioselectivity and moderate $E / Z$ selectivity was observed under the influence of the binaphthyl derived phase transfer catalyst $\mathbf{C 2 2}$.

### 2.1.1. Michael addition of $\alpha$-substituted cyanoacetates to $\alpha, \beta$-unsaturated ketones

Acyclic carbonyl compounds possessing multiple stereocenters are important building-blocks for the construction of complex natural products and bioactive molecules. The Michael addition of $\alpha$-substituted cyanoacetates to $\alpha, \beta$-unsaturated ketones may provide derivatives of type $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ depending on the substitution pattern of the ketone Michael acceptor (Figure 24). In this regard, very few examples of these additions have been reported for type $\mathbf{A}$ and type $\mathbf{B}$ structures, and, to the best of our knowledge, no examples leading to structures of type $\mathbf{C}$ bearing two non-adjacent stereocenters can be found in the literature. ${ }^{185,186}$ These units are of a great synthetic significance since they

[^38]are present in many biological active compounds such as erythromycins and related macrolide antibiotics. ${ }^{187}$ The corresponding precedents of these reactions are explained below.

Figure 24. Acyclic carbonyl compounds with different stereoarrays.

### 2.1.1.1. Unsubstituted $\alpha, \beta$-unsaturated ketones as acceptors

As mentioned previously, the use of metal complexes dominated the field of enantioselective conjugate additions of 2 -cyano esters to $\alpha, \beta$-unsaturated ketones until 2005. ${ }^{188}$ The first and, to the best of our knowledge, the only efficient organocatalyzed Michael addition of 2-substituted cyanoacetates to $\alpha, \beta$-unsaturated ketones was described in 2007. Chen and co-workers reported the highly enantioselective reaction of these substrates with vinyl ketones in the presence of the simple bifunctional thiourea/tertiary

amine organocatalyst C2 (Scheme 23). ${ }^{189}$ A number of $\alpha$-aryl substituted cyanoacetates were successfully employed in the addition to methyl vinyl ketone with the simultaneous formation of a quaternary stereocenter. Nevertheless, $\alpha$-alkyl cyanoacetates showed poor reactivity against this ketone but provided good results when aryl vinyl ketones were used as Michael acceptors.

Scheme 23. First organocatalyzed example of the Michael addition of $\alpha$-substituted cyanoacetates to vinyl ketones. Chen, 2007.

### 2.1.1.2. $\beta$-Substituted $\alpha, \beta$-unsaturated ketones as acceptors

Chen and co-workers also reported a catalytic and highly enantioselective addition of $\alpha$-unsubstituted cyanoacetates to $\beta$-substituted chalcone derivatives in the presence of the bifunctional thiourea organocatalyst C23 derived from hydroquinine (Scheme 24). ${ }^{190}$ Although the syn/anti diastereoselectivity was moderate, both adducts were obtained with excellent enantioselectivity. In this case no quaternary stereocenters are created.

[^39]

Scheme 24. Conjugate addition of cyanoacetates to $\beta$-substituted chalcones promoted by a bifunctional thiourea organocatalyst. Chen, 2007.

Adjacent quaternary and tertiary stereocenters are common structural motifs in complex natural products. In principle, the stereocontrolled conjugate addition of a trisubstituted carbon nucleophile to a $\beta$-substituted Michael acceptor could provide a onestep construction of such motifs. The simultaneous $C-C$ bond formation of sterically demanding both quaternary and tertiary stereocenters has proven to be a great challenge. In this context, Jørgensen and co-workers described the use of activated $\beta$ chloroalkenones as Michael acceptors in the enantioselective conjugate addition of $\alpha$ substituted cyanoacetates promoted by the phase-transfer catalyst C24 (Scheme 25). ${ }^{191}$ The resulting $\beta$-halo substituted enolate gave rapid elimination of the halide and this turned out to be the substitution of the vinylic halide with good control in the formation of the double bond.

[^40]

Scheme 25. Michael reaction of $\alpha$-substituted cyanoacetates to $\beta$-chloroalkenones promoted by a phasetransfer catalyst. Jørgensen, 2007.

Peters addressed this issue and provided a solution to this problem involving cyclic enones as acceptors and using metal catalysis. ${ }^{192}$ Different diastereomers as major products can be formed with high enantioselectivity depending on the use of a mono- or a bimetallic catalyst (Scheme 26). The planar chiral ferrocene based mono-palladacycle $\mathbf{C 2 5}$ in general furnishes the $(S, R)$ diastereomers with high enantioselectivity and the structurally related bis-palladacycle $\mathbf{C 2 6}$ gives predominantly access to the $(R, R)$ diastereomers with high enantiopurity.

Scheme 26. Michael addition of $\alpha$-aryl cyanoesters to cyclic enones promoted by metal catalysts. Peters, 2013.

[^41]On the other hand, Zhang reported the Michael addition of $\alpha$-substituted cyanoacetates to $\beta$-acyl activated enones catalyzed by quinine C14 generating a quaternary stereocenter (Scheme 27, a). ${ }^{193}$ Both $\alpha$-aryl and alkyl substituted cyanoacetates provided adducts with good diastereo- and enantioselectivities. Furthermore, only one example of the Michael reaction of $\alpha$-substituted cyanoacetates with $\beta$-substituted alicyclic enones has been documented. As shown in Scheme 27b, the reaction is catalyzed by the Jacobsen salen complex catalyst C27 and proceeds with excellent yields, diastereomeric ratios and $e e$ 's. ${ }^{194}$

### 2.1.1.3. $\alpha$-Substituted $\alpha, \beta$-unsaturated ketones as acceptors

To the best of our knowledge there are no reports involving the Michael addition of $\alpha$-substituted cyanoacetates to $\alpha$-substituted $\alpha, \beta$-unsaturated enones. Only a few examples of the addition of other Michael donors to other $\alpha$-substituted Michael acceptors have been published. For instance, Pihko described the Mukaiyama-Michael reaction

[^42]between silyloxyfurans and methacrolein via iminium activation (Scheme 28). ${ }^{195}$ The addition adducts were afforded in good to excellent enantioselectivities, but led to an approximately $1: 1$ mixture of the two possible diastereomers.

Scheme 28. Mukaiyama-Michael addition of silyloxyfurans to methacrolein catalyzed by a secondary amine. Pihko, 2012.

Moreover, Deng described the Michael addition of $\alpha$-substituted cyanoketones, $\alpha$ cyano(thio)esters and $\beta$-ketoesters to activated $\alpha$-chloroacrylonitrile as Michael acceptor affording the corresponding adducts in the presence of the bifunctional Brønsted base/ H bond organocatalysts C29 and C30, with excellent stereocontrol (Scheme 29, a, b and c). ${ }^{196}$ Then Chen extended the same methodology to 2-oxindoles as pronucleophiles to give adducts with excellent results (Scheme 29, d). ${ }^{197}$

[^43]

Scheme 29. Michael addition of a) $\alpha$-cyanoketones, b) $\alpha$-cyano(thio)esters, c) $\beta$-ketoesters and d) oxindoles to $\alpha$-chloroacrylonitrile promoted by Brønsted base catalysts.

All the previous precedents clearly show the difficulties involved in the Michael addition of $\alpha$-subsituted 2-cyano esters to enones with different substitution patterns. These are mainly associated to reactivity and stereocontrol problems. But not only enones, $\alpha, \beta$-unsaturated esters are also still challenging Michael acceptors in general and more specifically in the addition of $\alpha$-substituted cyano esters as shown below.

### 2.1.2. Michael addition of $\alpha$-substituted cyanoacetates to $\alpha, \beta$-unsaturated esters

The extension of this methodology to less reactive Michael acceptors, such as esters, remains challenging. Most of the reported Michael additions of $\alpha$-cyanoacetates to fully unsubstituted $\alpha, \beta$-unsaturated esters are racemic and among them the most employed promoters are metal-based and phosphine-based catalysts. ${ }^{198}$ In addition, and to

[^44]the best of our knowledge, no additions of $\alpha$-substituted cyanoacetates to $\beta$-substituted esters have been reported.

### 2.1.2.1. $\alpha$-Substituted $\alpha, \beta$-unsaturated esters

It is evident the problematic which implies the use of $\alpha, \beta$-unsaturated esters in Michael additions, and as far as we know, no examples of conjugate additions of $\alpha$ substituted cyano esters to $\alpha$-substituted $\alpha, \beta$-unsaturated esters have been described. More specifically additions of other nucleophiles to this type of acceptors still are limited. A remarkable precedent was described by Kobayashi in which a $\mathrm{Ca}(\mathrm{BOX})_{2} \mathbf{C 3 1}$ catalyzed the conjugate addition of glycine Schiff bases to $\alpha$-substituted acrylate methyl esters and amides (Scheme 30). ${ }^{199}$ The products were obtained with good enantioselectivity but moderate diastereoselectivity (syn/anti ratio below 67:33 for $\alpha$-alkyl substituted acrylate esters). The syn/anti ratio was improved up to $91: 9$ by using the acrylamide, but the enantioselectivity decreased.

Scheme 30. Michael addition of glycine Schiff bases to $\alpha$-substituted acrylate esters and acrylamide under metal catalysis. Kobayashi, 2008.

In 2011, the group of Chen and Xiao reported the tandem Michael $/ \alpha$-protonation reaction of 2-oxindoles to activated acceptors as ethyl $\alpha$-phthalimidoacrylate ${ }^{200}$ and ethyl $\alpha$-phosphonoacrylate ${ }^{201}$ under similar catalysis conditions (Table 2). In both cases remarkable stereoselectivities are obtained in the presence of catalysts C32 and C33, but the methods are restricted to doubly activated Michael acceptors ( $\alpha$-phthalimidoacrylate

[^45]and $\alpha$-phosphonoacrylate). Therefore, only $\alpha$-heterosubstituted carbonyl compounds are afforded.

Table 2. Examples of Michael additions of 2 -oxindoles to activated $\alpha$-substituted $\alpha, \beta$-unsaturated esters.

| Michael |
| :---: |
| acceptor |

Results

On the basis of all these precedents, it seems that the Michael addition of $\alpha$ substituted 2-cyano esters to different $\alpha, \beta$-unsaturated ketones and esters is difficult due to both reactivity and stereoselectivity problems. In view of the previously demonstrated efficiency of $\alpha$ '-hydroxy enones as $\alpha, \beta$-unsaturated ester and ketone surrogates in metalcatalyzed reactions, we hypothesized that these Michael acceptors would be good candidates for the conjugate reaction with $\alpha$-substituted cyanoacetates. Therefore, fully unsubstituted, $\beta$-substituted and $\alpha$-substituted $\alpha$ '-hydroxy enones were prepared and their potential in the Michael addition of $\alpha$-substituted cyanoacetates was investigated. These results are discussed in section 2.4.

### 2.2. Azlactones as Michael donors

Michael additions of heteroatom-bearing soft carbon nucleophiles are interesting and yet difficult processes to get products as single enantiomers. As mentioned before, azlactones can be used as general templates for the stereoselective synthesis of natural/unnatural amino acids and highly substituted heterocyclic scaffolds. ${ }^{202}$ They exhibit a dual behavior, as they present a nucleophilic and electrophilic nature.

[^46]Furthermore, as shown in Scheme 31, there are three different nucleophilic sites which make azlactone reactivity rich and interesting.

Scheme 31. Reactive sites of azlactones.

The use of azlactones as precursors for asymmetric synthesis of quaternary $\alpha$ amino acid derivatives was pioneered by the groups of Fu and Trost in the presence of metal catalysts in dynamic kinetic resolution ${ }^{203}$ and allylation reactions, ${ }^{204}$ respectively. However, the efficiency of azlactones as nucleophiles in enantioselective Michael additions was reported ten years later by Jørgensen and co-workers (Scheme 32). ${ }^{205}$ An efficient organocatalytic conjugate addition of 4 -substituted azlactones to $\alpha, \beta$-unsaturated aldehydes catalyzed by diarylprolinol silyl ether $\mathbf{C 1 3}$ was described with complete $C-4$ regioselectivity. Shortly, Hayashi reported a similar enantioselective transformation with slightly different reaction conditions. ${ }^{206}$

[^47]

Scheme 32. First examples of Michael reactions of azlactones with enals promoted by diarylprolinol silyl ethers.

Subsequently, many groups reported organocatalyzed Michael additions of 4substituted azlactones to various electrophiles to provide masked quaternary $\alpha$-amino acid derivatives or chiral oxyaminals depending on the $C-4$ or $C-2$ regioselectivity, respectively. Jørgensen employed nitroalkenes as electrophiles in the conjugate addition of oxazolones using thiourea cinchona derivative C35 as promoter with good yields, excellent diastereoselectivities and from moderate to good enantioselectivities (Scheme 33). ${ }^{207}$ It is remarkable that when $\mathrm{R}^{1}$ is a phenyl group the reaction takes place at the $C-4$ position; however, the reaction is $C-2$ specific with alkyl substituents which afford $\mathrm{N}, \mathrm{O}$ aminal compounds.

[^48]

Scheme 33. Michael addition of azlactones to nitroalkenes promoted by a thiourea catalyst affording $C-4$ or $C-2$ substituted products. Jørgensen, 2008.

### 2.2.1. $\alpha, \boldsymbol{\beta}$-Unsaturated ketones as Michael acceptors

The use of $\alpha, \beta$-unsaturated ketones as Michael acceptors in organocatalyzed conjugate additions of azlactones has been limited. Peters and co-workers reported the Michael addition of azlactones to enones promoted by metal mono- or bispalladiumcycle catalyst C36/C37 and excellent results were obtained (Scheme 34, a). ${ }^{208}$ Later, Amarante developed a ( $\pm$ )-camphorsulfonic acid C38 catalyzed methology for this transformation with high diastereoselectivities but without any enantioselectivity control (Scheme 34, b). ${ }^{209}$ In both cases the products obtained were only the anti isomers.

Scheme 34. Michael addition of azlactones to enones developed by Peters and Amarante.
R. Wang and co-workers described the Michael addition of azlactones to activated $\alpha, \beta$-unsaturated trichloromethyl ketones in the presence of the bifunctional thiourea catalyst C39 (Scheme 35, a). ${ }^{210}$ The trichloromethyl motif is a good electron-withdrawing group that activates the enone and after some transformations can be converted into the corresponding ester or amide. The reaction was developed for alkyl and aromatic substituents on both substrates and the corresponding syn adducts were afforded in good yields and in high to excellent diastereo- and enantioselectivities. Then, Y. Wang and X. W. Wang used $o$-hydroxy chalcone derivatives as Michael acceptors and the experimental results show that an $o$-hydroxy group on the aryl motif plays a crucial role in the regioselectivity of the reaction because $\mathrm{N}, \mathrm{O}$-aminals are exclusively obtained from the C 2 addition (Scheme 35, b). ${ }^{211}$

[^50] 2015, 13, 5698-5709.

Scheme 35. Michal addition of azlactones to $\beta$-substituted enones catalyzed by a bifunctional thiourea catalyst.

### 2.2.2. $\alpha, \beta$-Unsaturated esters as Michael acceptors

Concerning the Michael addition of azlactones to $\alpha, \beta$-unsaturated esters, only a few examples have been reported. It is worth to mention the only catalytic enantioselective example of the conjugate reaction of azlactones to acrylic esters developed by Kobayashi (Scheme 36). ${ }^{212}$ The chiral coordinative Pybox calcium catalyst C40 was found to be effective for these reactions and the desired adducts were obtained in relatively good yields and enantioselectivities.

[^51]

Scheme 36. Michael addition of azlactones to acrylic esters promoted by a calcium catalyst $\mathbf{C 4 0}$. Kobayashi, 2010.

Another type of $\alpha, \beta$-unsaturated esters are ynoates and allenoates; Ooi described the conjugate addition of azlactones to methyl propiolate catalyzed by an iminophosphorane. ${ }^{213}$ Recently, $\mathrm{Fu}^{214}$ and Lan and $\mathrm{Lu}^{215}$ employed the same type of methodology based on phosphine-catalysts to promote $\gamma$-additions of azlactones to allenoates with excellent diastereo- and enantiocontrol.

In view of the limited success in the Michael addition of azlactones to $\alpha, \beta$ unsaturated ketones and esters, $\alpha$ '-hydroxy enones were again considered as masked enones and $\alpha, \beta$-unsaturated esters. On this basis the reaction of azlactones with $\alpha^{\prime}$ hydroxy enones in the presence of BB catalyst was selected. The corresponding results are presented in the following sections.

### 2.3. Precedents and synthetic plan

As said in the Introduction, $\alpha^{\prime}$-hydroxy enones have shown to be very efficient acryloyl and ketone/aldehyde equivalents in diastereoselective reactions and metalcatalyzed enantioselective reactions such as Cu promoted cycloadditions and 1,4conjugate additions to various electrophiles. The resulting adducts can be converted into carboxylic acid derivatives, aldehydes or ketones upon oxidative cleavage of the ketol moiety (Scheme 37). ${ }^{216}$

[^52]

Scheme 37. Transformation of $\alpha^{\prime}$-hydroxy ketone moiety into carboxylic acid, aldehyde and ketone.

In the reported metal-promoted catalytic reactions the ability of the ketol moiety for both 1,4-metal and 1,4-proton binding revealed to be crucial for success (Figure 25, a). Based on these precedents it was hypothesized that the $H$-bonding ability of the ketol moiety in $\alpha^{\prime}$-hydroxy enone could participate as two-point $H$-bond donor/acceptor and acceptor/acceptor partner in the transition state (Figure 25, b). To the best of our knowledge, $\alpha^{\prime}$-hydroxy enones had not been previously studied in the context of organocatalytic asymmetric bond construction processes.

H-bond DA-model

$\equiv$ tunable groups

Figure 25. Different activation modes of $\alpha^{\prime}$-oxy enones.

On this basis and, as previously said, one of the goals of this Thesis was to investigate the efficiency of $\alpha^{\prime}$-hydroxy enones as Michael acceptors and ester/ketone surrogates in Brønsted base-promoted addition reactions with $\alpha$-substituted cyanoacetates
and azlactones as pronucleophiles. Both reactions would involve the creation of a quaternary stereocenter.

This project was started in collaboration with Professors Jesús M. García, José M. Odriozola and Jesús Razkin from the Department of Applied Chemistry (Universidad Pública de Navarra). To first explore the reactivity of these $\alpha$ '-hydroxy enones in Brønsted base catalysis, the research group from Navarra initiated this study by checking the reaction of cyanoacetates 44 and $\alpha$ '-hydroxy enone 18. They found that this enone was an effective Michael acceptor with not only $\alpha$-aryl, but also $\alpha$-alkyl cyanoacetates, a subclass of substituted cyanoacetates previously documented to be poorly reactive substrates particularly against alkyl vinyl ketones (Scheme 38). The squaramide family of catalysts proved to be the most effective in these instances. Catalyst $\mathbf{C 4}$ resulted optimal for the reaction between 18 and a range of both $\alpha$-aryl and $\alpha$-alkyl tert-butyl cyanoacetates 44.

Scheme 38. Michael addition of $\alpha$-substituted tert-butyl cyanoacetates 44 to $\alpha$ '-hydroxy enone 18 promoted by $\mathbf{C 4}$.

### 2.4. Results and discussion

We reasoned that the problems associated with the lack of efficient chirality transfer with $\alpha$-substituted cyanoacetates in conjugate additions could be solved by the capacity of $\alpha$ '-hydroxy enones for two-point binding.

For this purpose the reaction of both $\alpha$-aryl and $\alpha$-alkyl cyanoacetates 44 with $\alpha^{\prime}$ hydroxy enones $\mathbf{6 0}$ and $\mathbf{6 1}$ promoted by chiral bifunctional Brønsted bases was selected (Scheme 39). The corresponding results are presented in the next sections.

Scheme 39. Employed $\alpha$-aryl and $\alpha$-alkyl cyanoacetates 44 for the Brønsted base catalyzed Michael addition to $\alpha$ '-hydroxy enones $\mathbf{6 0}$ and $\mathbf{6 1}$.

### 2.4.1. Michael reaction of $\alpha$-substituted cyanoacetates with $\boldsymbol{\beta}$-substituted $\boldsymbol{\alpha}^{\prime}$-oxy enones

Taking into account the previous results obtained with $\alpha^{\prime}$-hydroxy vinyl ketone 18, we wondered whether this template model would be effective to generate a quaternary carbon adjacent to a tertiary stereogenic center, a synthetic task that generally presents difficulties as shown in the previous precedents.

Scheme 40. Proposed synthetic plan.

For that purpose several $\beta$-aryl and alkyl substituted $\alpha^{\prime}$-hydroxy enones were synthesized according to procedures previously described (Scheme 41). The classical Horner-Wadsworth-Emmons olefination protocol from the $\beta$-keto phosphonate $\mathbf{3 1}$ was used to afford alkyl substituted $\alpha$ '-hydroxy enones 60A-F (Scheme 41, a). This
phosphonate was prepared from commercial hydroxyester 62. ${ }^{217}$ Likewise, for $\beta$-aryl substituted $\alpha^{\prime}$-hydroxy enone 60G aldol condensation of $\mathbf{1 5}$ with benzaldehyde was employed (Scheme 41. b). ${ }^{218}$
a) $\beta$-Alkyl substituted $\alpha^{\prime}$-hydroxy enones

b) $\beta$-Aromatic substituted $\alpha^{\prime}$-hydroxy enones

Scheme 41. General procedures for the synthesis of $\beta$-alkyl and $\beta$-aromatic substituted $\alpha^{\prime}$-hydroxy enones.

It was gratifying to observe that $\alpha$-aryl cyanoacetates $\mathbf{4 4 a} \mathbf{- d}$ and $\mathbf{4 4 f}$ reacted with $\beta$-alkyl substituted $\alpha^{\prime}$-hydroxy enones $\mathbf{6 0 A}-\mathbf{E}$ in the presence of $\mathbf{C 4}$ as catalyst to furnish adducts 64 in good yields (Table 3). The reactions were carried out in 1,2dichloromethane at $40^{\circ} \mathrm{C}$ and generally essentially one diastereomer was produced in excellent enantiomeric excess. However, enone 60E provided 60Ea in good yields but with lower stereoselectivity. As exceptions, $\beta$-substituted enones 60F and 60G, bearing the cyclohexyl and phenyl groups, respectively, were ineffective and did not react under these conditions.

[a] Reaction conditions: $\mathbf{4 4}$ ( 0.3 mmol ), enone $\mathbf{6 0}$ ( 3 equiv., 0.9 mmol ) and catalyst $\mathbf{C 4}(10 \mathrm{~mol}$ $\%)$ in $1,2-\mathrm{DCE}(1.2 \mathrm{~mL})$ at $40^{\circ} \mathrm{C}$ otherwise stated. Yield of isolated products after column chromatography. The ee values were determined by HPLC analysis on a chiral stationary phase. [b] Reaction carried out at $50^{\circ} \mathrm{C}$.

On the other hand, $\alpha$-alkyl cyanoacetate 44 h was unreactive and did not provide the corresponding adduct. Despite these limitations, which confirms the difficulties associated to these problematic pronucleophiles, the method represents the first Michael addition of $\alpha$-substituted cyanoacetates to $\beta$-alkyl enones catalyzed by a chiral Brønsted base. Once more, the excellent behavior of $\alpha^{\prime}$-hydroxy enones as Michael acceptors is confirmed.

Then the behavior of $\beta$-substituted $\alpha, \beta$-unsaturated simple esters was analyzed. No reaction was observed from cyanoacetates $\mathbf{4 4 a}, \mathbf{4 4 c}$ and $\mathbf{4 4 d}$ with methyl 5-phenylpent-2enoate 65 in the presence of $\mathbf{C 4}$ (Scheme 42). However, the Michael addition of these substrates to $\beta$-substituted $\alpha^{\prime}$-oxy enone $\mathbf{6 0 A}$ followed by oxidative cleavage provided the desired corresponding carboxylic acids 67 .

Scheme 42. Michael addition of $\alpha$-substituted cyanoacetates to $\beta$-substituted $\alpha, \beta$-unsaturated simple esters and an indirect solution to the low reactivity.

The reaction between cyanoacetate 44a and trans-3-nonen-2-one 68, which lacks the $\alpha$ '-hydroxy group, catalyzed by $\mathbf{C 4}$ was also examined (Scheme 43). The reaction proceeded, but it required 7 days to reach $95 \%$ of conversion and the product was formed as a $80: 20$ mixture of diastereomers with only modest enantioselectivity for the major isomer 69. In contrast, the reaction between 44 a and $\alpha^{\prime}$-hydroxy enone $\mathbf{6 0 H}$ gave essentially 70 as essentially single diastereomer in $94 \% e e$. This method enables an alternative and highly enantioselective entry to product 69 via usual alkylation and oxidative scission.

Scheme 43. Conjugate addition of $\alpha$-substituted cyanoacetates to simple enone trans-3-nonen-2-one $\mathbf{6 8}$ and indirect solution to the low inherent stereoselectivity.

In order to confirm the stereochemical assignments of the adducts, compound 64Ca was converted into the methyl ketone 71 and upon subsequent transesterification, afforded the corresponding methyl ester 72 (Scheme 44). This compound exhibited essentially identical ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra to those reported in the literature ${ }^{219}$ but opposite optical activity confirming the stereochemistry.

Scheme 44. Stereochemical assignment of the Michael adducts.

### 2.4.2. Michael reaction of $\alpha$-substituted cyanoacetates with $\alpha$-substituted $\alpha^{\prime}$-oxy enones

To the best of our knowledge, no direct, catalytic and highly both diastereo- and enantioselective approach has been described for the construction of $\alpha$-alkyl carbonyl structures. After the excellent results obtained with non-substituted and $\beta$-substituted $\alpha$ '-

[^54]hydroxy enones, we proposed $\alpha$-substituted $\alpha^{\prime}$-hydroxy enones as Michael acceptors for the construction of $\alpha, \gamma$-branched carbonyl analogs through Michael reactions promoted by Brønsted base catalysts.

In comparison to the earlier approach to construct $\beta, \gamma$-branched carbonyls, two major problems related to the construction of $\alpha, \gamma$-branched carbonyl analogs are: (i) the low electrophilicity of most Michael acceptors bearing an $\alpha$-methyl substituent against neutral $C$-pronucleophiles ${ }^{220}$ and (ii) the complications associated to the face-selective $\alpha$ protonation of the in situ formed enolates. Concerning the last problem, one of the issues is how to control the E/Z configuration of the enolate. ${ }^{221}$ Moreover, the small size of the proton and the need that both elements of the stereoinduction (the initially generated $\gamma$ stereocenter and the chiral catalyst), work in concert are additional concerns.

Scheme 45. Proposed synthetic plan for the construction of $\alpha, \gamma$-branched carbonyl compounds.

Initial attempts to carry out the Brønsted base-catalyzed reaction of 2-phenyl cyanoacetate $\mathbf{4 4 a}$ with representative carbonyl Michael acceptors confirmed the above difficulties. For instance, as shown in Table 4, attempts to react 44a with methyl methacrylate 73 in the presence of several mono- and bifunctional Brønsted base catalysts all led to the recovery of starting materials. With catalyst $\mathbf{C 4}$, the reaction of 44a and 3methylbutenone 75 took place slowly and higher temperatures $\left(50^{\circ} \mathrm{C}\right)$ were needed for

[^55]significant progress ( $60 \%$ conversion after 90 h ), affording $45 \%$ isolated yield, moderate diastereoselectivity ( $80: 20 \mathrm{dr}$ ) and good enantioselectivity ( $92 \% \mathrm{ee}$ ) for the major diastereomer 79. Finally, aldehyde 77 resulted more reactive, but led to essentially uncontrolled stereoselectivity.

Table 4. Difficulties in the addition of $\alpha$-cyanoacetate 44a to simple $\alpha$-methyl substituted carbonyl Michael acceptors.

| Entry | R | Conditions | Yield (\%) | dr | $\boldsymbol{e} \boldsymbol{e}$ (major/minor) |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 2 | H | r.t., $100 \%$ conv., 24 h | 8378 | $60: 40$ | $14 \% / 10 \%$ |

Previous work with non-substituted and $\beta$-substituted $\alpha^{\prime}$-oxy enones as an acrylate surrogate, encouraged us to try $\alpha^{\prime}$-substituted $\alpha^{\prime}$-hydroxy enones as Michael acceptors. On this basis, we speculated that $\alpha$-methyl $\alpha$ '-hydroxyenone $\mathbf{6 1}$ might serve as an efficient novel methacrylate surrogate in $\mathrm{BB} / H$-bond catalyzed conjugate additions helping to solve the problems mentioned before.

The initial catalyst screening, Table 5 , showed us that once again catalyst $\mathbf{C 4}$ was the most efficient in promoting the conjugate addition of 2-phenyl cyanoacetate 44a to $\alpha$ methyl $\alpha$ '-hydroxy enone 61. In order to get full conversions, the reactions were run at 50 ${ }^{\circ} \mathrm{C}$. Interestingly, almost perfect enantio- and diastereocontrol were observed, indicating that not only the conjugate addition step that forms a $\gamma$-stereocenter, but also the subsequent $\alpha$-protonation, proceeded with remarkable face selectivity. Surprisingly, catalyst $\mathbf{C 4 3}$ showed lower reactivity with $\alpha$-substituted $\alpha$ '-hydroxy enone $\mathbf{6 1}$ and afforded 79a with only $23 \%$ conversion after 72 h at $50^{\circ} \mathrm{C}$.

Table 5. Catalyst screening for the conjugate addition of 2-phenyl cyanoacetate 44a to $\alpha$-methyl $\alpha^{\prime}$ hydroxy enone 61.

Conversion related to the disappearance of the starting material. Yield of isolated products after column chromatography. The ee values were determined by HPLC analysis on a chiral stationary phase.

Next, the reaction scope was explored with different $\alpha$-substituted cyanoacetates (Table 6). Under optimized conditions which involve 1.5 equivalents of cyanoacetate and
$10 \mathrm{~mol} \%$ of $\mathbf{C 4}$ in 1,2-DCE at $50^{\circ} \mathrm{C}$, the reaction of $\mathbf{6 1}$ worked equally well with other $1-$ aryl cyanoacetates $\mathbf{4 4 a - f}$ to afford the corresponding addition adducts $\mathbf{7 9 a}-\mathbf{f}$ as essentially single diastereomer in yields within the range from $69 \%$ to $95 \%$ and $e e$ values greater than $95 \%$ in all every case. However, the reaction was unsuccessful with ortho-methyl aryl substituted or methyl substituted cyanoacetates $\mathbf{4 4 g}$ and $\mathbf{4 4 h}$ and only starting materials were recovered even when the reaction was heated up to $70^{\circ} \mathrm{C}$.

[a] Reaction conditions: 61 ( 0.2 mmol ), $\mathbf{4 4}$ ( 1.5 equiv., 0.3 mmol ), catalyst $\mathbf{C 4}$ ( $10 \mathrm{~mol} \%$ ), in 1,2-DCE ( 0.4 mL ). Conversion related to the disappearance of the starting material. Yield of isolated products after column chromatography. The ee values were determined by HPLC analysis on a chiral stationary phase. [b] Reaction carried out at $70^{\circ} \mathrm{C}$.

The reactivities of $\alpha^{\prime}$-hydroxy enone $\mathbf{6 1}$ and 3-methylbutenone $\mathbf{7 5}$ were compared in the presence of $\alpha$-phenyl cyanoacetate 44 and catalyst $\mathbf{C 4}$ in 1,2 -DCE and at $50^{\circ} \mathrm{C}$. Once more, the design of enone $\mathbf{6 1}$ demonstrated to be instrumental in achieving these levels of reactivity. For example, when an equimolecular mixture of enone $\mathbf{6 1}$ and 3methylbutenone 75 was stirred with $\alpha$-phenyl cyanocacetate at $50^{\circ} \mathrm{C}$ for 24 h in the presence of $10 \mathrm{~mol} \% \mathbf{C 4}$, a $85: 15$ mixture of 79a and 76, respectively, was obtained (Scheme 46).

Scheme 46. ${ }^{1} \mathrm{H}$-NMR spectra on an aliquote after 24 h at $50^{\circ} \mathrm{C}$ of the conjugate addition of $\alpha$-cyanoacetate 44a to a mixture of $\alpha^{\prime}$-hydroxy enone 61 and 3-methylbutenone 75, showing the relation between the two addition products 79a and 76 .

With these adducts in hand, diverse carbonyl compounds (carboxylic acids and aldehydes) are easily affordable following the procedures described before (Scheme 47). For example, treatment of adduct 79a with $\mathrm{NaIO}_{4}$ in $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ provided carboxylic acid 80 in $86 \%$ yield along with acetone as the only organic side product formed. Alternatively, reduction of the carbonyl group followed by diol cleavage as above furnished aldehyde 78 in $76 \%$ yield over the two steps. Thus, this methodology
overcomes the reactivity issue of methacrylate ester $\mathbf{7 3}$ and enal $\mathbf{7 7}$ noted above (see Table 4, page 94 ).

Scheme 47. Conversion of the ketol moiety into carboxy and aldehyde functionalities.

The relative and absolute configuration of adduct 79b were established by a single crystal X-ray analysis (Figure 26) and the configuration of the remaining adducts was assigned by assuming a uniform reaction mechanism.

### 2.4.3. Michael reaction of azlactones with $\alpha$ '-oxy enones

After the excellent results obtained from $\alpha$-substituted cyanoacetates, we considered the extension of the methodology to other nucleophiles. Products containing tetrasubstituted stereogenic carbons bearing a sulfur, oxygen or nitrogen heteroatom are also interesting but difficult compounds to obtain as single enantiomers. In this context, we decided to investigate the efficiency of our template model in Brønsted base-catalyzed conjugate additions of several heteroatom-bearing soft carbon nucleophiles. For this study $4 H$-oxazol-5-ones (azlactones) were selected. More specifically the azlactones and $\alpha^{\prime}$ hydroxy enones shown in Scheme 48 were investigated.

Scheme 48. Employed azlactones 81-87 for the Brønsted base catalyzed Michael addition to $\alpha^{\prime}$-hydroxy enones 18, 88 and 60 B with different substitution patterns.

First, a catalyst screening with different bifunctional Brønsted bases was carried out for the reaction of azlactone 81c with $\alpha^{\prime}$-hydroxy enones $\mathbf{1 8}$ and $\mathbf{8 8}$ (Table 7). We found out that reaction with $\alpha$ '-hydroxy enone $\mathbf{1 8}$ proceeds in the presence of catalyst $\mathbf{C 4}$, but without any stereocontrol. Further exploration led us to obtain better enantioselectivities with the modified enoyl template 88, prepared by simple silylation of the hydroxyl group in enone 18. The reaction of azlactone 81 c and enone $\mathbf{8 8}$ catalyzed by either $\mathbf{C 4}$ or $\mathbf{C 4 3}$ in dichloromethane at $-20^{\circ} \mathrm{C}$ provided, after desilylation of the resulting intermediate, the corresponding addition product 89c in good yields and enantioselectivities.

Complete conversion related to the disappearance of the starting material. The $e e$ values were determined by HPLC analysis on a chiral stationary phase.

The scope of the azlactone was then explored by modifying the $\mathrm{R}^{2}$ group. The reactions were carried out in the presence of catalysts $\mathbf{C 4}$ and $\mathbf{C 4 3}$ (Table 8) and all proceeded with high site selectivity as no products from reaction at the $C-2$ position of the azlactone ring were observed when $\mathrm{R}^{2}$ was an aromatic group. In general, similar enantioselectivities were obtained with electron-donor and electron-withdrawing substituents in the aromatic ring. However, when $\mathrm{R}^{2}$ was an aliphatic group ( ${ }^{t} \mathrm{Bu}$ ) the reaction did not take place and only the starting materials were detected.

Complete conversion related to the disappearance of the starting material. Yield of the adduct after column chromatography. The $e e$ values were determined by HPLC analysis on a chiral stationary phase.

Solvent and temperature screening was also carried out. The best results were obtained with chlorinated solvents, as dichoromethane and 1,2-dichloroethane (Table 9, entries 3,4). Temperature influence was investigated in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as solvent and enantioselectivities decreased as temperature decreased. The best enantiomeric excess was obtained in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature (entry 6) with 1.5 equivalents of enone.

After optimization, we found that the best conditions for the conjugate addition of azlactones to $\alpha^{\prime}$-silyloxy enone $\mathbf{8 8}$, involved the use of 1.5 equivalents of enone, 10 mol $\%$ of squaramide $\mathbf{C 4}$ in dichloromethane at room temperature or $-20^{\circ} \mathrm{C}$. In this way, very good yields and excellent enantioselectivities were obtained after desilylation with several alkyl and aryl substituents at the $C-4$ position of the azlactone (Table 10). Nevertheless, it was necessary to increase the equivalents of enone and catalyst loading up to 3 equiv. and $20 \mathrm{~mol} \%$, respectively, for full conversion in the case of $\mathbf{8 9 b}$ that bears the bulky isopropyl substituent.

[b] For complete conversion it was necessary 3 equivalents of enone and $20 \%$ mol of catalyst. Complete conversion related to the disappearance of the starting material. Yield of the adduct after column chromatography. The $e e$ values were determined by HPLC analysis on a chiral stationary phase.

Elaboration of the obtained azlactone adducts afforded useful building blocks (Scheme 49). For instance, azlactone ring can be opened by treatment with triflic acid in methanol with quantitative yield. Subsequent ketol elaboration of 96, following the same procedure as for cyanoacetates, provided the corresponding carboxylic acids 97 with excellent yields.

Scheme 49. Elaboration of adducts 89c and 89d.

The carboxylic acid 97d was then transformed into the known glutamic acid derivative $\mathbf{9 8}^{222}$ and the comparison of optical rotation values set the stereochemical course of the catalytic reaction (Scheme 50).

Scheme 50. Elaboration of adduct to $\alpha, \alpha$-disubstituted glutamic acid derivative.

In contrast to the case of cyanoacetates noted above, the reaction of azlactones with $\beta$-alkyl $\alpha^{\prime}$-hydroxy enones did not provide the corresponding addition products even at higher temperatures. For instance, when azlactone 81d was treated with the $\beta$ substituted $\alpha^{\prime}$-hydroxy enone $\mathbf{6 0 B}$ in the presence of squaramide catalyst $\mathbf{C 4}$ in 1,2dichloromethane at $70^{\circ} \mathrm{C}$ no addition product was detected (Scheme 51).

Scheme 51. Conjugate addition of 4-benzyl-2-phenyloxazol-5(4H)-one 81d to the $\beta$-substituted $\alpha$ '-hydroxy enone 60 B promoted by squaramide catalyst $\mathbf{C 4}$.

[^56]Finally, the efficiency of $\alpha^{\prime}$-oxy enones in Brønsted base catalyzed reactions was corroborated by our group from the Michael addition using different pronucleophiles (Scheme 52). ${ }^{223}$ Excellent yields and enantioselectivities were observed in the addition of 2 -oxindoles, 5 H -thiazol-4-ones, 5 H -oxazol-4-ones and 1 H -imidazol-4(5H)-ones to $\alpha$ '-oxy enones. The latter ones showed to serve as effective equivalents of $N$-substituted quaternary $\alpha$-amino acids and medicinally interesting 5,5-disubstituted hydantoins. ${ }^{223 b}$

### 2.4.4. Computational studies

With all the results obtained, it was clear that $\alpha$ '-oxy enones exhibit some unique reactivity compared to ordinary enones, such as, MVK. Both higher reactivity and enantioselectivity have been observed in the BB-catalyzed reactions studied.

Similarly, our experimental results indicate a distinct behavior of $\alpha^{\prime}$-oxy enones as compared with other typical enoyl templates previously reported for the BB-catalyzed enantioselective generation of quaternary stereogenic carbon centers. More specifically, the catalyst controlled conjugate addition of $\alpha$-substituted cyanoacetates is, as mentioned before, sluggish with the majority of Michael acceptors, while it works well with $\alpha^{\prime}$-oxy enones.

With the aim to understand better such distinguishing behavior, we decided to study computationally ${ }^{224}$ the case of the conjugate additions of cyanoacetates. A DFT investigation was carried out in our department by Dr. Enrique Gómez-Bengoa and Béla Fiser selecting methyl vinyl ketone (MVK) and the two $\alpha^{\prime}$-oxy enones $\mathbf{1 8}$ and $\mathbf{1 0 0}$ as the model Michael acceptors and examining the relationship between their reactivity and structure. Calculations show that the intramolecular $H$-bond activation in $\mathbf{1 8}$ and $\mathbf{1 0 0}$ induces a change in a series of electronic parameters (Figure 27), explaining their higher reactivity in comparison with MVK.

[^58]a) Structure

18
$\omega=2.0 \mathrm{eV}$
$E_{\text {LUMO }}=-1.9 \mathrm{eV}$

$\Delta \mathrm{G}^{\ddagger}=11.1 \mathrm{kcal} / \mathrm{mol}$

Black numbers: Natural Population Analysis

100
$\omega=2.0 \mathrm{eV}$
$E_{\text {LUMO }}=-1.9 \mathrm{eV}$

$\Delta G^{\ddagger}=15.5 \mathrm{kcal} / \mathrm{mol}$

$\Delta G^{\ddagger}=17.7 \mathrm{kcal} / \mathrm{mol}$

Figure 27. Structure-reactivity relationship.

In particular, the electrophilicity index $\omega^{225}$ for both $\mathbf{1 8}$ and $\mathbf{1 0 0}(\omega=2.0 \mathrm{eV})$ is higher than for MVK ( $\omega=1.6 \mathrm{eV}$ ), which is consistent with the lower energy LUMO for $\mathbf{1 8}$ and $\mathbf{1 0 0}(-1.9 \mathrm{eV})$ as compared to LUMO of MVK ( -1.5 eV ). In the same way, the character of the $\beta$-carbon of $\mathbf{1 8}$ is more positive (Natural Population Analysis, NPA charge of -0.31 ) than the corresponding $\beta$-carbon of MVK $(-0.34)$. These values correlate well with the Wiberg bond index for $\mathbf{1 8}$ (1.90) and MVK (1.92), respectively, indicating the lower double bond character of the enone $C=C$ bond in 18.

Subsequently, the activation energy of the reaction of these three Michael acceptors with methyl $\alpha$-methylcyanoacetate $\mathbf{4 4 h}$ was calculated (Figure 27, b). This barrier resulted significantly lower for $\alpha^{\prime}$-hydroxy enone $18(11.1 \mathrm{kcal} / \mathrm{mol})$ than for MVK ( $17.7 \mathrm{kcal} / \mathrm{mol}$ ). On the other hand, although the electronic parameters of both $\alpha^{\prime}-$ hydroxy enones $\mathbf{1 8}$ and $\mathbf{1 0 0}$ do not differ significantly from one another, the reaction involving the latter presents an activation energy $4.4 \mathrm{kcal} / \mathrm{mol}$ higher than the reaction with 18. This additional stabilization of the transition state (TS) for the reaction with $\mathbf{1 8}$ as compared with $\mathbf{1 0 0}$ is consistent with the shorter intramolecular hydrogen bond in the

[^59]first case ( 1.69 vs $1.83 \AA$ ) and might be attributed to a Thorpe-Ingold effect ${ }^{226}$ imparted by the two germinal methyl substituents in $\mathbf{1 8}$.

The origin of the stereoselectivity in the $\mathbf{C 4}$-catalyzed reaction between $\alpha$ 'hydroxy enone 18 and $\alpha$-cyanoacetates was studied next. Firstly, the $H$-bond pattern formed between the catalyst and both substrates in the TS corresponding to the $C-C$ bond-forming step was examined. In this respect, up to three different ternary complexes (A-C, Figure 28) have been proposed for reactions involving noncovalent cooperative activation of the nucleophile and electrophile, typically described in a bifunctional thiourea (or squaramide)-tertiary amine catalysis. ${ }^{227}$ Therefore, the question of whether or not a unified H -bond network model ( $\mathbf{A}, \mathbf{B}, \mathbf{C}$, other) could be applied to different reactions within this catalysis category seems to be still open and more data are desirable.

[^60]

A

B

Figure 28. Three alternative substrate-catalyst combinations.

In our case, despite much effort, any plausible transition structure of type $\mathbf{B}$ was not found among the several $H$-bond combinations studied. ${ }^{228}$ From a look to the geometries of the resulting complexes, it seemed that once cyanoacetate is $H$-bonded to the catalyst there is no space available for the electrophile to interact with the same catalyst molecule. Therefore, the structure closest to $\mathbf{B}$ found involves an approach of the $H$-bonded cyanoacetate anion to the non complexed enone. ${ }^{229}$ On the other hand, a single structure similar to model $\mathbf{C}$ was also found; however, it was predicted to be unrealistic due to its high activation energy.

In its turn, four possible structures of type $\mathbf{A}\left(\mathbf{T S}-\mathbf{R}_{\mathbf{1}}, \mathbf{T S}-\mathbf{S}_{\mathbf{1}}, \mathbf{T S}-\mathbf{R}_{\mathbf{2}}, \mathbf{T S}-\mathbf{S}_{\mathbf{2}}\right.$, Figure 29) were located, in which the $\alpha$-hydroxy enone carbonyl is double $H$-bonded to the squaramide NH groups, while the protonated quinuclidine $\mathrm{NH}^{+}$might bind to either the $C N$ or the ester group of the cyanoacetate moiety.

[^61]

TS-R ${ }_{1}$ $\Delta \Delta \mathrm{G}=0 \mathrm{kcal} / \mathrm{mol}$

TS-R2
$\Delta \Delta G=6.1 \mathrm{kcal} / \mathrm{mol}$

TS-S ${ }_{1}$
$\Delta \Delta \mathrm{G}=2.8 \mathrm{kcal} / \mathrm{mol}$

TS-S 2
$\Delta \Delta \mathrm{G}=6.4 \mathrm{kcal} / \mathrm{mol}$

Figure 29. Located TSs for the catalytic addition reaction.

TS- $\mathbf{R}_{\mathbf{1}}$ is the lowest in energy and correctly explains the formation of the major isomer observed experimentally. Extrapolation of this TS model to the reaction between $\beta$-substituted enones and cyanoacetates would also correctly predict the ( $S, S$ ) relative configuration of these adducts obtained in Table 3. The other TS structure B predicts products of wrong relative stereochemistry upon a similar extrapolation. The next most feasible structure is TS-S $\mathbf{S}_{\mathbf{1}}$. Interestingly, in both cases, the $\mathrm{CO}_{2}{ }^{t} \mathrm{Bu}$ is involved in H bonding with the catalyst $\mathrm{NH}^{+}$moiety, while the methyl ( $\mathbf{T S}-\mathbf{S}_{\mathbf{1}}$ ) and the cyano group $\left(\mathbf{T S}-\mathbf{R}_{1}\right)$ are, respectively, almost eclipsed with the enone double bond. The energy difference between them is $2.8 \mathrm{kcal} / \mathrm{mol}$ at the $\mathrm{M} 06-2 \mathrm{X} / 6-311+\mathrm{G}^{* *}$ computational level ${ }^{230}$ and the preference of $\mathbf{T S}-\mathbf{R}_{\mathbf{1}}$ is attributed to a larger destabilizing effect of pseudoeclipsed methyl (dihedral angle $21.9^{\circ}$ ) than pseudoeclipsed cyano (dihedral angle $33.5^{\circ}$ ). The remaining two structures, $\mathbf{T S}-\mathbf{R}_{\mathbf{2}}$ and $\mathbf{T S}-\mathbf{S}_{\mathbf{2}}$, both involving a $N H^{+} \ldots N C$ interaction, are 6.1 and $6.4 \mathrm{kcal} / \mathrm{mol}$ higher in energy than $\mathbf{T S}-\mathbf{R}_{\mathbf{1}}$, respectively.
${ }^{230}$ Zhao, Y.; Truhlar, D. G. Theor. Chem. Acc. 2008_120, 215-241.

From these results some conclusions can be obtained: (i) in the studied catalytic reactions, the ketol moiety of the acceptor $\alpha$ '-hydroxy enone plays a key role in decreasing reaction energy barriers; (ii) among several possible $H$-bond combinations for the nucleophile-catalyst-electrophile complex, type $\mathbf{A}$ is preferred, with the squaramide group interacting with the $\alpha$ '-hydroxy enone (electrophile activation), and the protonated quinuclidine interacting with the cyanoacetate anion (nucleophile activation); (iii) given the previous data in the literature in favor of models of type $\mathbf{B}$ and $\mathbf{C}$ for related catalytic reactions, a unified model cannot be proposed for all reactions involving this type of noncovalent bifunctional catalysis; (iv) calculations for our system confirms that H -bond with the nitrile group contributes poorly to TS stabilization as compared with $H$-bond to a ester group, probably due to the fact that linear arrangements (as in $C \equiv N \cdots H \mathrm{X}$ ) are more difficult to fit in the TS than angular arrangements (as in $C=O \cdots H \mathrm{X}$ ). ${ }^{231}$ Eventually, the combination of these factors leads to the highly stereoselective formation of the new quaternary stereocenter in addition adducts.

## 3. Pyrrolidin-2,3-diones as pronucleophiles in organocatalytic asymmetric reactions

### 3.1. Pyrrolidin-2,3-diones: General characteristics

The search for new pronucleophiles which effectively participate in asymmetric catalytic reactions and provide diverse functionalities for subsequent elaborations is of a great interest. In this field, pyrrolidin-2,3-diones (Figure 30) are synthetic scaffolds which are present in a variety of biologically important compounds. ${ }^{232}$ From the synthetic point of view, this cyclic $\alpha$-ketoamide combines both nucleophilic and electrophilic characteristics, which can enable various types of reactions and sequential or cascade transformations with suitable nucleophiles or electrophiles.

Figure 30. Structure of pyrrolidin-2,3-diones, and their nucleophilic and electrophilic character.

Compared to 1,3 -dicarbonyl compounds, ${ }^{233}$ there are not many organocatalytic examples of the use of 1,2-dicarbonyl compounds (1,2-diketone, $\alpha$-ketoester and $\alpha$ ketoamide $)^{234}$ as carbon-centered nucleophiles despite their diverse reactivity and synthetic value. Utilization of 1,2-dicarbonyl compounds in asymmetric organocatalytic transformations has been limited to the increased electrophilic ketone reactivity by the presence of an adjacent carbonyl group. ${ }^{235}$ This highlights the importance of the

[^63]development of suitable selective organocatalyzed activation modes for enhancing the nucleophilic potential of 1,2-dicarbonyl compounds towards cross-condensation instead of competitive self-condensation.

### 3.2. Biological relevance of pyrrolidinone skeletons

Enantioenriched pyrrolidinone skeletons are of great biological and pharmaceutical interest ${ }^{232}$ and many efforts have been made in the development of their synthesis with diverse structural features. ${ }^{236}$ Among them, $\gamma$-butyrolactams or 2pyrrolidinones 101 (Figure 31) are a class of versatile core structures found in many natural products with important biological properties as cytotoxicity, antitumor and antiinflammatory activities. ${ }^{237}$ They are also excellent precursors for the synthesis of biologically active pyrrolidine derivatives. ${ }^{238}$

Other interesting modified skeletons are $\alpha$-methylene derivatives $\mathbf{1 0 2}^{239}$ and the structurally related $\alpha$-keto- $\gamma$-butyrolactams or pyrrolidin-2,3-diones $\mathbf{1 0 3}$ (Figure 31). Both of them are the core of many natural products and drugs displaying diverse activities. For instance, the pyrrolidin-2,3-dione scaffold has been demonstrated to be a privileged structure in the design of protein-protein interactions. ${ }^{240}$

Figure 31. General structure of $\gamma$-butyrolactams or 2-pyrrolidinones 101, $\alpha$-methylene derivatives 102 and pyrrolidin-2,3-diones $\mathbf{1 0 3}$ and some biologically active examples.

Despite their interest, little is known about the asymmetric synthesis and reactions of chiral pyrrolidin-2,3-diones. There is only one example about the use of this type of substrates in organocatalysis reported by Xu and co-workers exploring their dual reactivity in a one-pot Michael/Pictet-Spengler sequence (Scheme 53). ${ }^{241}$ Synthetically interesting and medicinally important pentacyclic butyrolactam-fused indoloquinolizidines are efficiently constructed in a highly stereocontrolled manner. The reaction is proposed to be initiated by iminium ion activation by the secondary amine catalyst in the Michael addition of $\mathbf{1 0 4}$ to $\mathbf{1 0 5}$ to produce the chiral hemiacetal 106. Under acidic conditions, the activated hemiacetal reacts with tryptamine $\mathbf{1 0 7}$ to generate the iminium ion 108, which undergoes a diastereoselective Pictet-Spengler reaction ${ }^{242}$ to afford the butyrolactam-fused indoloquinolizidines 109.

[^65]

Scheme 53. Only example of the use of pyrrolidin-2,3-diones in asymmetric organocatalysis: sequential Michael addition/Pictet-Spengler cyclization. Xu, 2012.

More recently, the utility of 4-alquiliden pyrrolidin-2,3-diones $\mathbf{1 1 0}$ as Michael acceptors has been demonstrated in a reaction with sulfur ylides $\mathbf{1 1 1}$ to provide spirocyclopropanes 112 (Scheme 54). ${ }^{243}$ Despite of not being an asymmetric reaction, the corresponding adducts $\mathbf{1 1 2}$ are obtained with very good yields and excellent cis/trans diastereoselectivity.

Scheme 54. Spiro-cyclopropane synthesis from 4-alquiliden pyrrolidin-2,3-diones 110. Xu, 2015.

## 3.3. $\boldsymbol{\beta}$-Amino acids from pyrrolidin-2,3-diones

Apart from biological properties, pyrrolidin-2,3-diones can also be precursors of $\beta$-amino acids, which are present in a variety of natural products, pharmaceutical agents

[^66]and mimics of protein structural motifs. ${ }^{244}$ The substitution pattern and configuration at the $C-2$ and/or $C-3$ position of $\beta$-amino acids (Figure 32) strongly influence the structural, chemical and biological characteristics of $\beta$-amino acids and their oligomers ( $\beta$-peptides). Therefore, the development of efficient protocols for the enantioselective synthesis of $\beta$ amino acids with different substitution patterns has been of great interest.

Although a number of methods have been successfully developed for the synthesis of $\beta^{2}-, \beta^{3}-, \beta^{3,3}$-, $\beta^{2,3}$ - amino acids, ${ }^{245}$ the stereoselective preparation of or $\beta^{2,2}$-derivatives (Figure 32) still remains challenging, ${ }^{246}$ especially with catalytic strategies, since an allcarbon substituted quaternary stereocenter has to be generated.

$\beta^{2}$-amino acid

$\beta^{3}$-amino acid

$\beta^{2,3}$-amino acid

Figure 32. Different substitution patterns in $\beta$-amino acids.

Most of the methods for the synthesis of $\beta^{2,2}$-amino acids are based on diastereoselective approaches, ${ }^{247}$ and catalytic enantioselective examples are currently

[^67]very limited. These involve Michael additions of carbon centered nucleophiles to $\beta$ nitroacrylates, conjugate reactions of $\alpha$-substituted cyanoacetates to different electrophiles, enantioselective Henry reaction of nitromethane with $\alpha$-keto esters and the catalytic asymmetric acylation of (silyloxy)nitrile anions. The contributions and limitations of these protocols are summarized below.

One of the approaches makes use of $\beta$-nitroacrylates as Michael acceptors. After the conjugate addition, the nitro group can be reduced to generate the corresponding $\beta^{2,2_{-}}$ amino ester (Scheme 55). This strategy has been explored with different carbon-centered nucleophiles. For instance, Meggers ${ }^{248}$ and Jia ${ }^{249}$ developed the asymmetric FriedelCrafts alkylation of indoles with $\alpha$-substituted $\beta$-nitroacrylates catalyzed by the iridium and niquel complexes C46 and C47, respectively (Scheme 55, a). In both cases the corresponding adducts containing a quaternatery stereocenter were synthesized with excellent results even from $\alpha$-alkyl substituted $\beta$-nitroacrylates. Later, Bencivenni reported the efficient $\gamma$-functionalization of oxindoles bearing nonsymmetric 3 -alkylidene groups via vinylogous Michael reaction catalyzed by the cinchona derived thiourea $\mathbf{C 4 8}$ with only $\alpha$-aryl $\beta$-nitroacrylates (Scheme 55, b). ${ }^{250}$ Making use of a similar type of catalyst, Hu and Zhao optimized the enantioselective Michael reaction of malononitrile with $\alpha$-aryl substituted $\beta$-nitroacrylates producing adducts in high yield and enantioselectivities promoted by the thiourea-based bifunctional Brønsted base C49 (Scheme 55, c). ${ }^{251}$ In the same context, Jørgensen disclosed a new activation concept for polycyclic $\pi$-systems by using aminocatalysis (Scheme 55 , d). In this case, an example of Diels-Alder reaction of an anthracene aldehyde was developed using $\alpha$-methyl $\beta$ nitroacrylates in the presence of the bifunctional aminocatalyst C50 with excellent results. ${ }^{252}$ A similar type of activation strategy has been reported by Wennemers in the Michael addition of aliphatic aldehydes to $\alpha$-aryl $\beta$-nitroacrylates promoted by the peptide-base catalyst C51 affording adducts with high yields and stereoselectivity (Scheme 55, e). ${ }^{253}$ Finally, Melchiorre described the vinylogous Michael addition of a
complexes, see: c) Barluenga, J.; Canteli, R. M.; Flórez, J.; García-Granda, S.; Gutiérrez-Rodríguez, A.; Martín, E. J. Am. Chem. Soc. 1998, 120, 2514-2522.

Scheme 55. Different $C$-centered pronucleophiles employed in the Michael addition to $\beta$-nitroacrylates for the enantioselective synthesis of $\beta^{2,2}$-amino acids.

[^68]This strategy has been extended to other heteronucleophiles (Scheme 56, a). More specifically, oximes ${ }^{255}$ and thiols ${ }^{256}$ have also been used as pronucleophiles in the Michael addition to $\beta$-nitroacrylates promoted by the bifunctional thiourea C39 and the cinchona alkaloid C53 generating tetrasubstituted stereocenters with high enantioselectivity.

b) Transformations of the Michael adducts

Scheme 56. a) Different $O$ - and $S$-centered pronucleophiles employed in the Michael addition to $\beta$ nitroacrylates for the enantioselective synthesis of $\beta^{2,2}$-amino acids. b) Transformation of the Michael adducts into $\beta^{2,2}$-amino acids. Xiao, 2009-2010.

[^69]The addition adducts from these type of heteronucleophiles are valuable building blocks as they are highly functionalized. For example, cleavage of the weak $\mathrm{N}-\mathrm{O}$ bond and simultaneous reduction of the nitro group under mild condition with $10 \% \mathrm{Pd} / \mathrm{C} / \mathrm{H}_{2}$ afforded $\alpha$-hydroxy $\beta$-amino ester $\mathbf{1 1 4}$ (Scheme $56, b, 1$ ). ${ }^{255}$ Subsequent protection with benzoyl chloride and hydrolysis of the ester group provided the $\beta^{2,2}$-amino acid derivative 115. In a similar way, the corresponding $p$-tolylthio $\beta^{2,2}$-amino acids 118 were obtained through a three-step sequence which involves nitro-reduction/amine acylation/ester hydrolysis in high yield and with retention of optical purity (Scheme 56, b, 2). ${ }^{256}$

Another strategy for the enantioselective production of $\beta^{2,2}$-amino acids is the Michael addition of $\alpha$-substituted cyanoacetates to different electrophiles (Scheme 57). In this case, the corresponding adducts can also be hydrogenated to give the corresponding $\beta^{2,2}$-amino derivatives. As previously exposed in Chapter 2, Chen reported the addition of this type of pronucleophiles to vinyl ketones ${ }^{257}$ and vinyl sulfones; ${ }^{258}$ however, the strategy is limited to the more reactive $\alpha$-aryl cyanoacetates.

Scheme 57. Michael addition of $\alpha$-substituted cyanoacetates to vinyl ketones and vinyl sulfones for the synthesis of $\beta^{2,2}$-amino acids. Chen, 2006-2007.

A further approach is the Henry reaction of nitromethane to various $\alpha$-keto esters which gives access to enantioenriched $\beta$-nitro- $\alpha$-hydroxy esters (Table 11). The latter compounds can be easily transformed into $\beta$-amino- $\alpha$-hydroxy esters by a simple hydrogenation. Several groups have described this reaction promoted by metal-based and organocatalysts. For instance, Jørgensen employed copper (II) triflate salt in combination with the chiral bisoxazoline ligand C54 to afford adducts in yields and enantioselectivities from moderate to excellent (Table 11, a). ${ }^{259}$ Later, Blay and Pedro changed the ligand to iminopyridines; however, little improvement was observed in the results (Table 11, b). ${ }^{260}$

[^70]Sohtome and Nagasawa obtained similar results with the thiourea-guanidine bifunctional organocatalyst C56 (Table 11, c); ${ }^{261}$ but Deng made a substantial progress in this reaction observing excellent yields and enantioselectivities with all alkyl and aryl substituted $\alpha$ ketoesters in the presence of the cinchona alkaloid C57 as catalyst (Table 11, d). ${ }^{262}$

Table 11. Enantioselective Henry reaction of nitromethane with $\alpha$-keto esters for the synthesis of $\beta^{2,2}$, amino acids promoted by different catalysts.

Finally, Johnson developed an asymmetric cyanation/1,2-Brook rearrangement/Cacylation reaction of acylsilanes with cyanoformates catalyzed by the (salen)aluminum alkoxide C58 (Scheme 58). ${ }^{263}{ }^{1} \mathrm{H}$-NMR spectroscopy suggests that the metal alkoxide

[^71]C58 reacts with benzyl cyanoformate to form the catalytically active (cyano)aluminum complex $\mathbf{1 2 3}$ which would react with acylsilanes $\mathbf{1 1 9}$ generating protected cyanohydrins anions 124. Then 1,2 -Brook rearrangement would provide species $\mathbf{1 2 5}$ which after subsequent $C$-acylation with cyanoformate $\mathbf{1 2 0}$ would led to the adduct $\mathbf{1 2 1}$, precursor of $\beta^{2,2}$-amino- $\alpha$-hydroxy ester $\mathbf{1 2 2}$.

Scheme 58. Catalytic asymmetric acylation of (silyloxy)nitrile anions to provide masked $\alpha$-hydroxy $\alpha$ substituted $\beta^{2,2}$-amino esters. Johnson, 2004.

Besides the narrow range of enantioselective methods for the synthesis of $\beta^{2,2_{-}}$ amino acids, there is also the fact that the common tactic for the incorporation and/or derivatization of $\beta^{2,2}$-amino acids into peptide segments involves $N$-protection, subsequent carboxyl group activation and final coupling (Scheme 59, a), thus complicating somewhat the process. In this context, $\beta$-amino acid $N$-carboxyanhydrides constitute a very attractive option as they offer simultaneously $N$-protection and carboxyl group activation (Scheme 59, b). To follow this strategy $\beta^{2,2}$-amino acids have to be transformed into the corresponding N -carboxyanhydrides.
a) General scheme:

Scheme 59. a) General scheme for the incorporation and/or derivatization of amino acids into peptidic sequences and b) $N$-carboxyanhydride approach.

Our group has previously synthesized directly $\beta$-amino acid $N$-carboxyanhydrides of type $\mathbf{1 2 7}$ containing a quaternary stereocenter starting from disubstituted $\beta$-lactams of type 126 (Scheme 60, a ). ${ }^{264}$ This protocol provides an attractive and short route for the incorporation of $\beta^{2,2}$-amino acids into peptides. On this basis, we considered 4,4disubstituted pyrrolidin-2,3-diones $\mathbf{1 2 8}$ could be suitable substrates for this purpose (Scheme 60, b). Therefore, an enantioselective protocol for the synthesis of 4,4disubstituted pyrrolidin-2,3-diones would be required.

[^72]
### 3.4. Synthetic plan

Catalytic enantioselective construction of pyrrolidin-2,3-diones with an all-carbon quaternary stereocenter at $C-4$ is an objective still unrealized. Probably, one reason that justifies this situation is that the alkylation reaction of pyrrolidin-2,3-diones by alkyl halides provides mainly $O$-alkylated products (Scheme 61 ). ${ }^{265}$ Experiments carried out by Southwick and Barnas demonstrated that sodium enolates obtained from the 4-benzyl-pyrrolidin-2,3-diones give a mixture of 3:1 of $O$-alkylated and $C$-alkylated products.

Scheme 61. Alkylation reaction of sodium enolates of 4 -substituted pyrrolidin-2,3-diones providing both $O$ - and $C$-alkylation products.

Experimental data (IR and NMR analysis) corroborate that 4-substituted pyrrolidin-2,3-diones are enolized to a large extent as will be explained later. On this basis, we hypothesized that in the presence of a chiral Brønsted base the reaction of these substrates with an appropriate Michael acceptor would proceed to give $C$-4-disubstituted derivatives otherwise inaccessible through direct reaction with the corresponding alkyl halides (Scheme 62, a). It was also expected that any background racemic reaction should be suppressed by the proper choice of the catalyst. Additionally, Baeyer-Villiger oxidation of Michael products would give $N$-carboxyanhydrides and after subsequent coupling with a nucleophile $\beta$-amino acids, esters or amides. (Scheme 62, b).

[^73]a)

b)

Scheme 62. a) Current challenges in the asymmetric reaction of 4-substituted pyrrolidin-2,3-diones. b) Transformation of the Michael adducts into $\beta^{2,2}$-amino acid derivatives.

This constitutes a part of a more general project in our group on the potential of 4substituted pyrrolidin-2,3-diones as new pronucleophiles in the realm of asymmetric catalysis. In the following sections the preliminary results of this study are presented and further investigations are currently underway in our laboratory.

### 3.5. General synthesis of pyrrolidin-2,3-diones

The synthesis of 2,3-pyrrolidin-2,3-diones was outlined according to the following retrosynthetic scheme (Scheme 63).

Scheme 63. Retrosynthetic scheme of pyrrolidin-2,3-diones.

This synthetic procedure was previously described in the literature for nonsubstituted pyrrolidin-2,3-diones (Scheme 64, a). ${ }^{266}$ The first step of the proposal is the reaction of the corresponding $\beta$-amino ester with ethyl oxalate followed by an in situ decarboxylation. The conjugate addition of the corresponding amine to the $\alpha$-substituted acrylate was considered for the preparation of the $\beta$-amino esters (Scheme 64, b).

[^74]a) Reported protocol for the synthesis of 4-unsubstituted pyrrolidin-2,3-diones

Southwick, $1953{ }^{266}$
b) Proposed synthesis for 4-substituted pyrrolidin-2,3-diones

Scheme 64. a) Reported protocol for the synthesis of 1-benzylpyrrolidine-2,3-dione and b) proposed synthesis for 4 -substituted pyrrolidin-2,3-diones.

Thus, in a first instance we focused on the preparation of both $\alpha$-alkyl and aryl acrylates according to the procedure outlined below.

### 3.5.1. Preparation of acrylates

$\alpha$-Substituted methyl acrylates were synthesized following protocols described in the literature. Two different synthetic approaches were considered for alkyl and aryl substituted acrylates. The formers were prepared via retro-Claisen reaction of the corresponding $\beta$-keto derivatives $\mathbf{1 3 1}$ and these were synthesized by methyl acetoacetate 130 alkylation (Scheme 65). ${ }^{267}$ Methyl methacrylate 132a is commercially available and the yields of the synthesized $\alpha$-alkyl acrylates are summarized in Scheme 65.

[^75]

Scheme 65. Retrosynthesis and synthetic procedure for the preparation of $\alpha$-alkyl substituted acrylates.
$\alpha$-Susbtituted aryl acrylates can be obtained through the addition of the corresponding Grignard reagent to methyl pyruvate $\mathbf{1 3 3}$. ${ }^{267}$ Reaction conditions for the synthesis of the $\alpha$-phenyl acrylate 132d are described in Scheme 66, which was obtained in $70 \%$ yield over the two steps.

Scheme 66. Retrosynthesis and synthetic procedure for the preparation of $\alpha$-aryl substituted acrylates.

### 3.5.2. Preparation of $\boldsymbol{\beta}$-amino esters

$\beta$-Amino esters were synthesized via the addition of the corresponding amine to the $\alpha$-substituted acrylate (Table 12). Initially the reactions were performed in the presence of manganese chloride (Table 12, method A). ${ }^{268}$ Under these conditions $\beta$-amino esters 138a-d, 139a and 140a were obtained in good yields (entries 1-6). However, under the same conditions isopropyl amine $\mathbf{1 4 1}$ did not react. In this case, the use of ruthenium (III) chloride as catalyst and polyethylene glycol as solvent provided better results (entry 7). ${ }^{269}$

### 3.5.3. Cyclization/decarboxylation reaction

Pyrrolidin-2,3-diones were synthesized by reaction of the $\beta$-amino esters with ethyl oxalate in the presence of sodium ethoxide in absolute ethanol. ${ }^{266}$ Ethanol is distilled to facilitate cyclization and decarboxylation occurs simultaneously in these reaction conditions affording the cyclic adduts from good to excellent yields (Table 13).

${ }^{[a]} \mathrm{A}$ solution of the $\beta$-amino ester ( 1 equiv.) and ethyl oxalate ( 1.2 equiv.) in EtOH was added to a solution of NaOEt ( 1.2 equiv.) in EtOH . The ethanol was removed by distillation.

Previous studies by Southwick and Barnas, supported by IR spectroscopy showed that 4 -substituted pyrrolidin-2,3-diones are fully enolized. ${ }^{265}$ This was also corroborated by IR analysis of our synthesized pyrrolidin-2,3-diones. Infrared spectrum of nonsubstituted pyrrolidin-2,3-dione $\mathbf{1 4 8}$ shows two bands of $C=O$ stretch related to the ketone and the amide (Figure 33). However, the presence of the OH stretch and the lack of $C=O$ stretch in the spectrum of 4-methyl substituted compound 144a explains the tendency to enolization of these compounds. Further support it is also given by the ${ }^{1} \mathrm{H}$ NMR spectrum of compound 144a, which shows that the compound is fully enolized (Figure 34).

### 3.6. Results and discussion

We began our study by exploring the reaction of $N$-benzyl 4-methyl pyrrolidin-2,3-dione 144a with different electrophiles promoted by the Brønsted base catalysts $\mathbf{C 4}$ and C59 (Table 14). For that purpose methyl vinyl ketone, methyl acrylate, $\alpha^{\prime}$-hydroxy enone, di-tert-butyl azodicarboxylate, 1,1-bis(phenylsulfonyl)ethylene and nitrostyrene were selected. The corresponding results are shown in Table 14. The conjugate addition to methyl vinyl ketone in the presence of $\mathbf{C 4}$ at $-10{ }^{\circ} \mathrm{C}$ provided after 16 h the corresponding adduct in full conversion, good yield and excellent enantioselectivity (Table 14, entry 1). However, only $50 \%$ of conversion was observed with methyl acrylate as Michael acceptor and catalyst $\mathbf{C 4}$ at room temperature in 24 h (Table 14, entry 2). This result corroborates once more the lower reactivity of acrylates as Michael acceptors in these reactions. In view of the good results obtained in Chapter 2 with $\alpha$ 'oxy enones as ester surrogates, we also checked the reaction with these acceptors, which after 16 h at $10^{\circ} \mathrm{C}$ in the presence of catalyst $\mathbf{C 4}$ reacted in total conversion, good yield and excellent enantioselectivity (Table 14, entry 3). The $\alpha$-amination of these substrates was also checked with di-tert-butyl azodicarboxylates. A rapid reaction was observed even at -40 ${ }^{\circ} \mathrm{C}$ catalyzed by $\mathbf{C 4}$ providing in 1 h the adduct in high yield and enantioselectivity (Table 14, entry 4). Moreover, the Michael addition to vinyl (bis)sulfone showed this acceptor to
be reactive, nevertheless, the adduct was afforded with lower enantiomeric excess (Table 14, entry 5). Finally, the reaction of pyrrolidin-2,3-dione and nitrostyrene was carried out in the presence of $\mathbf{C 5 9}$, which was available in the laboratory and belongs to a family of catalysts recently developed in our group. The corresponding Michael adducts were obtained in good results (Table 14, entry 6).

[a] Reaction conditions: 144a ( 0.2 mmol ), Michael acceptor and the catalyst ( 10 or $20 \mathrm{~mol} \%$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(0.4 \mathrm{~mL})$. Yield of isolated products after column chromatography. The $e e$ values were determined by HPLC analysis on a chiral stationary phase. [b] Conversion related to the disappearance of the pyrrolidin-2,3-dione. [c] Absolute configuration not determined.

We then envisaged that depending on the nature of the electrophile retro-addition could also occur. On this basis, the stability of the addition adducts previously obtained was studied under different conditions (Table 15). Adducts obtained from methyl vinyl ketone, $\alpha$ '-hydroxy enone and di-tert-butyl azodicarboxylate showed excellent stability in the presence of $10 \mathrm{~mol} \%$ catalyst $\mathbf{C 4}$ for 24 h at room temperature and no decrease in the enantioselectivity was observed in any case (Table 15, entries $1-3$ ). However, after treatment of the adduct coming from vinyl (bis)sulfone with catalyst $\mathbf{C 4}$ for 2 h at room temperature, the enantioselectivity was considerably affected (from $60 \%$ ee to $12 \% e e$ ) (Table 15, entry 4). This is an evidence of the racemisation of the adduct in the presence of the catalyst most probably due to the retro-Michael reaction. The same behavior was confirmed in the case of the adduct coming from the reaction with nitrostyrene since after treatment with TEA or acid silica only the starting materials were recovered (Table 15, entry 5).

These data clearly show that the selection of the appropriate electrophile for the Michael addition of 4-substituted pyrrolidin-2,3-diones is key for success, not only regarding reactivity and stereocontrol, but considering also the retro-addition probability. Therefore, first exploration of the Michael reaction was undertaken with methyl ketones, $\alpha$ 'oxy enones and azo-dicarboxylates as acceptors. The corresponding results are presented in the following sections.

Table 15. Experiments carried out to check the stability of the addition adducts and retro-Michael reaction.
(10 mol \%

### 3.6.1. Michael addition to methyl vinyl ketone and $\alpha^{\prime}$-oxy enones

In a first instance, the reaction of pyrrolidin-2,3-diones 144 with methyl vinyl ketone $\mathbf{1 5 0}$ in the presence of catalyst $\mathbf{C 4}$ was explored (Scheme 67). 4-Methyl and 4benzyl substituted pronucleophiles $\mathbf{1 4 4 a}$ and $\mathbf{1 4 4} \mathbf{c}$ were reacted with 2 equiv. of the enone $\mathbf{1 5 0}$ in the presence of $10 \mathrm{~mol} \%$ of catalyst in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Full conversions were observed in both cases after 24 h and the adducts 151 were obtained in good yield and excellent enantioselectivities. Further results from our group have shown that the reaction is equally efficient with other pyrrolin-2,3-diones and enones.

Scheme 67. Michael reaction of pyrrolidin-2,3-diones 144 with methyl vinyl ketone 150 promoted by catalyst $\mathbf{C 4}$.

After these preliminary results and taking into account the low conversion (50\%) obtained in the Michael reaction of pyrrolidin-2,3-dione 144a with methyl acrylate promoted by $\mathbf{C 4}$ at room temperature in 24 h (Table 14, entry 2 ), the utility of $\alpha^{\prime}$-oxy enones as acrylate surrogates was thought to solve this reactivity problem. After examining several common bifunctional Brønsted bases, it was gratifying to observe that the best results were obtained with quinine derived squaramide catalyst $\mathbf{C 4}$ and the silylated hydroxyl enone 88 (Table 16), although improvement was still needed. Enantioselectivity was measured in the desilylated adducts $\mathbf{1 5 2}$ and the same procedure for azlactones, acetic acid in acetonitrile and water for 1 h at room temperature, was applied for the desilylation.

Table 16. Catalyst screening for the conjugate addition of pyrrolidin-2,3-diones $\mathbf{1 4 4}$ to $\alpha^{\prime}$-oxy enones 18 and $\mathbf{8 8}$. ${ }^{[a]}$

[a] Reaction conditions: 144 ( 0.3 mmol ), enone (3 equiv., 0.9 mmol ), catalyst ( $20 \mathrm{~mol} \%, 0.06$ $\mathrm{mmol})$, in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.9 \mathrm{~mL})$. The ee values were determined by HPLC analysis on a chiral stationary phase.

Then temperature screening was carried out with pyrrolidin-2,3-diones 144a and 145a in the presence of squaramide $\mathbf{C 4}$ (Table 17). Optimal reaction temperature for substrate $\mathbf{1 4 4 a}$ was found to be $-10{ }^{\circ} \mathrm{C}(90 \% e e$, entry 2$)$ because at lower temperatures the enantiolectivity is depleted ( $86 \% e e$, entry 3 ). However, with substrate 145a, excellent enantioselectivities are obtained even at room temperature ( $90 \% e e$, entry 4) and decreasing the temperature to $-10^{\circ} \mathrm{C}$ the enantiomeric excess slightly improves $(96 \% \mathrm{ee}$, entry 6).

[b] Related to the disappearance of the starting material. [c] Determined by HPLC analysis on a chiral stationary phase.

For both substrates $-10^{\circ} \mathrm{C}$ was chosen as optimal temperature and then the reaction scope was investigated with different pyrrolidin-2,3-dione derivatives. As Table 18 shows, after conjugate addition and desylilation, good yields and enantioselectivities were afforded with $N$-benzyl pyrrolidin-2,3-diones 144 and 145 . The reaction was more efficient with naphthalene-1-yl-methyl derivative 145a providing the corresponding adduct 153a in excellent yield and enantioselectivity.

[a] Reaction conditions: $\mathbf{1 4 4}$ or $\mathbf{1 4 5}(0.3 \mathrm{mmol}), \mathbf{8 8}$ (3 equiv., 0.9 mmol$)$ and catalyst $\mathbf{C 4}$ (20 $\mathrm{mol} \%, 0.06 \mathrm{mmol})$ in dichloromethane ( 0.6 mL ). Enantioselectivities determined by HPLC analysis on a chiral stationary phase.

The absolute configuration was determined for compound 153a by X-ray single crystal structure analysis and that of the remaining adducts was established by assuming a uniform reaction mechanism (Figure 35).

Figure 35. X-Ray structure for compound 153a.

### 3.6.2. $\alpha$-Amination of pyrrolidin-2,3-diones with tert-butyl azodicarboxylate

In order to demonstrate the efficiency of this type of pronucleophiles in Brønsted base catalysis, reaction of pyrrolidin-2,3-dione 144a and tert-butyl azodicarboxylate 38 was carried out in presence of different bifunctional catalysts (Table 19). Once more, the best results were obtained with quinine derived squaramide catalyst $\mathbf{C 4}$ with 1.5 equivalents of azodicarboxylate 38 at $0^{\circ} \mathrm{C}$ in dichloromethane and, in all cases, reaction conversions were completed in 2 h , but enantioselectivity still needed improvement.

Table 19. Brønsted base catalyst screening for the reaction of pyrrolidin-2,3-dione 144a and tert-butyl azodicarboxylate 38. ${ }^{[a]}$

[a] To a mixture of the $\alpha$-ketoamide $144 \mathrm{a}(41 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) and catalyst $(0.02 \mathrm{mmol}$, $10 \mathrm{~mol} \%)$ in dichloromethane $(0.4 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$, di-tert-butyl azodicarboxylate $38(69 \mathrm{mg}, 0.3$ mmol, 1.5 equiv.) was added. The resulting mixture was stirred at the same temperature until consumption of the $\alpha$-ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was directly purified by flash column chromatography on silica gel (eluent hexane/ ethyl acetate 80/20) without previous work-up to afford the expected adduct $\mathbf{1 5 4 a}$.

In this instance, we thought that a modification of the catalyst might improve the enantioselectivity value of $80 \%$ obtained with C4. Catalyst C60, which is easily affordable by tuning the carboxylic moiety, provided better results than catalyst $\mathbf{C 4}$ (Table 20). Excellent enantioselectivities were obtained in all cases with catalyst C60 changing the temperature from $0{ }^{\circ} \mathrm{C}$ to $-40{ }^{\circ} \mathrm{C}$, whilst with $\mathbf{C 4}$ enantioselectivity gradually improved by decreasing temperature.

Table 20. Temperature screening for the reaction of 4-methyl pyrrolidin-2,3-diones 144a and tert-butyl azodicarboxylate $\mathbf{3 8}$ catalyzed by $\mathbf{C 4}$ and C60. ${ }^{[a]}$

[a] To a mixture of the $\alpha$-ketoamide $\mathbf{1 4 4 a}(41 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) and catalyst ( 0.02 mmol , $10 \mathrm{~mol} \%$ ) in dichloromethane ( 0.4 mL ), di-tert-butyl azodicarboxylate 38 ( $69 \mathrm{mg}, 0.3 \mathrm{mmol}$, 1.5 equiv.) was added. The resulting mixture was stirred until consumption of the $\alpha$-ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was directly purified by flash column chromatography on silica gel (eluent hexane/ ethyl acetate $80 / 20$ ) without previous work-up to afford the expected adduct 154a.

Once in hand the best catalyst and optimal conditions, we proceeded to explore the reaction scope with different $N$ protecting groups and substituents in $C-4$ (Table 21). In general, the amination reaction of $\mathbf{1 4 4} \mathbf{- 1 4 7}$ with $\mathbf{3 8}$ promoted by $\mathbf{C 6 0}$ at $-40^{\circ} \mathrm{C}$ give products 154-157 with very good yields and enantioselectivities between $96-99 \%$ with alkyl and aryl groups at $C-4$. Moreover, the reaction seems to be independent of the substituent $R^{2}$ and both $145 a$ and 146a led to 155a and 156a with excellent yields and $96 \% \mathrm{ee}$. However, the reaction of pyrrolidin-2,3-dione 147a bearing the bulky isopropyl group needed longer reaction time ( 16 h ) for completion and provided essentially a single enantiomer 157a.

Figure 36. X-Ray structure for compound 154b.

### 3.6.3. Michael addition to vinyl (bis)sulfones

Taking into account the retro-Michael addition that suffer the addition adducts $\mathbf{1 5 9}$ coming from 1,1-bis(phenylsulfonyl)ethylene 158, we decided to transform the adducts into compounds less probable to give the retro-Michael addition. For that purpose, we designed the synthetic pathway shown in Table 22. After the conjugate addition, the resulting adduct $\mathbf{1 5 9}$ would be converted into the corresponding NCA $\mathbf{1 6 0}$ at low temperature to avoid the retro-Michael reaction and then subsequently opened with benzylamine. For that purpose first the lower temperature at which the retro-addition occurs was determined and it was found that at $-20^{\circ} \mathrm{C}$ or lower temperatures it did not take place. Therefore, the asymmetric reaction was carried out first at $-20^{\circ} \mathrm{C}$ in the presence of catalyst $\mathbf{C 4}$ and the $\beta$-amino amide $\mathbf{1 6 1}$ was obtained in $80 \%$ ee (Table 22, entry 1). Lowering the temperature to $-60^{\circ} \mathrm{C}$ did not improve that value (Table 22, entry 2 ), neither by using the other squaramide-type catalysts (Table 22, entries 3-5).

Table 22. The Michael addition of 4-substituted pyrrolidin-2,3-dione 144a to 1,1bis(phenylsulfonyl)ethylene $\mathbf{1 5 8}{ }^{[a]}$

| Entry | Catalyst | $\mathbf{T}\left({ }^{\mathbf{o}} \mathbf{C}\right)$ | $\mathbf{t}(\mathbf{m i n})$ | Conv. (\%) | Yield (\%) | $\boldsymbol{e e}(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $\mathbf{C 4}$ | -20 | 15 | 100 | 77 | 80 |
| 2 | $\mathbf{C 4}$ | -60 | 15 | 100 | 75 | 62 |
| 3 | $\mathbf{C 6 0}$ | -20 | 15 | 100 | 60 | 36 |
| 4 | $\mathbf{C 6 1}$ | -20 | 15 | 100 | 68 | -32 |
| 5 | $\mathbf{C 4 3}$ | -20 | 15 | 100 | 65 | -18 |

[a] To a mixture of the $\alpha$-ketoamide 144 a ( $41 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) and catalyst ( 0.02 mmol , $10 \mathrm{~mol} \%$ ) in dichloromethane ( 0.4 mL ), bis(phenylsulfonyl)ethylene $158(93 \mathrm{mg}, 0.3 \mathrm{mmol}$, 1.5 equiv.) was added. The resulting mixture was stirred until consumption of the $\alpha$-ketoamide and $m$ CPBA ( $75 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) was in situ slowly added. After reaction completion ( 1 h ) benzylamine ( $26 \mu \mathrm{~L}, 0.24 \mathrm{mmol}, 1.2 \mathrm{Eq}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added dropwise and it was stirred for 16 h . The reaction was quenched with aqueous $10 \% \mathrm{NaHSO}_{3}$ and it was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. All organic phases were washed with NaOH 1 N , dried over $\mathrm{MgSO}_{4}$ and evaporated under reduced pressure.

In this case the retro-Michael reaction was also evaluated by treating adduct $\mathbf{1 6 1}$ with catalyst $\mathbf{C 4}$ at room temperature for 2 h (Scheme 68). Nevertheless, the final acyclic adduct seems not to racemize under these conditions.

Scheme 68. Control experiment carried out to evaluate the retro-Michael reaction in adduct 161.

### 3.7. Elaboration of the adducts

These densely functionalized adducts can be transformed into different functionalities. Oxidative cleavage of the ketol moiety proceed without affecting the 1,2diketo functionality with the same reaction conditions reported before for the adducts coming from the reaction with cyanoacetates and azlactones (Scheme 69). Carboxylic acid $\mathbf{1 6 2}$ was afforded in $86 \%$ yield and its transformation into the corresponding methyl ester 163 with (trimethylsilyl)diazomethane was quantitative. These adducts are formally derived from the addition to the unreactive methyl acrylate. Once more, the synthetic utility of $\alpha^{\prime}$-oxy enones as ester surrogates is demonstrated.

Scheme 69. Ketol scission to carboxylic acid and ester.

In addition to the above transformation, it was also found that treatment of pyrrolidin-2,3-diones with $m$-chloroperbenzoic acid ( $m$-CPBA) furnished $\beta$-amino acid $N$ carboxyanhydrides ( $\beta^{2,2}$-NCAs) with excellent yields. To the best of our knowledge, this is the first approach to enantiomerically enriched $\beta^{2,2}$-NCAs from non $\alpha, \alpha$-disubstituted $\beta$ amino acids precursors. Coupling of these NCAs with appropriate nucleophiles provides a quick entry to more elaborated containing $\beta^{2,2}$-amino acid products.

For example, 164, obtained by treatment of 153 a with 1.5 equivalents of $m$ CPBA, followed by the addition of tert-butyl ester of $L$-phenylalanine, Scheme 70, furnished the coupling product 165 in $77 \%$ yield. This intermediate was transformed into the N -Boc derivative 166 by hydrogenation carried out in the presence of $(\mathrm{Boc})_{2} \mathrm{O}$ and further elaboration of the ketol moiety provided the dicarboxylic acid 167. Although major improvement is needed for these last two steps, the approach could be clearly advantageous.

Scheme 70. Elaboration into $\beta^{2,2}$ amino acid N-carboxyanhydride pyrrolidin-2,3-diones and derivatives.

Similarly, ring expansion of 154a upon coupling with glycine ethyl ester afforded the $\alpha$-tetrasubstituted $\beta$-amino $\alpha$-hydrazino acid derived peptide $\mathbf{1 6 9}$ in $\mathbf{7 5 \%}$ of yield.

Scheme 71. Elaboration of adduct 154a.

## 4. (Dichloroiodo)benzene-mediated desulfurative chlorination of alkyl phenyl sulfides

This part of the work was carried out in the group of Prof. Mauro Adamo in The Royal Collegue of Surgeons in Ireland (RCSI). In this project the chlorination of alkyl phenyl sulfides promoted by (dichloroiodo)benzene has been explored. This work has been carried out together with Dr. Stefano Lancianesi, Chiara Strinna and Daniele Canestrari under the supervision of Dr. Hasim Ibrahim and Prof. Mauro Adamo.

A novel chlorination reaction from secondary/tertiary alkyl phenyl sulfides, as well as, sulfa-Michael derived sulfides, promoted by (dicloroiodo)benzene ( $\mathrm{PhICl}_{2}$ ) has been developed. This mild and rapid oxidative reaction affords elimination sensitive benzylic chlorides in good yields.

### 4.1. Introduction

Alkyl chlorides are of great synthetic interest as building blocks and these motifs are present in a variety of natural products (Figure 37). ${ }^{270}$ Chlorinated molecules have attracted attention in drug discovery and the development of new methods for the formation of carbon-chlorine bonds is a relevant area of research nowadays.

4-Chlorothreonine (unnatural amino acid)

Hapalindole A

Figure 37. Biologically interesting alkyl chlorides.

[^77]A general procedure for obtaining alkyl chlorides is the $\mathrm{S}_{\mathrm{N}} 2$ displacement of carbinols with chloride ion. ${ }^{271}$ However, this strategy needs the activation of the strong $\mathrm{sp}^{3}$ hybridized $C-O$ bond towards chloride ion reaction and traditionally conversion of alkyl alcohols, for instance, into the corresponding sulfonated esters has been employed. ${ }^{272}$ One important drawback is the atom efficiency of these reactions since byproducts are generated along with product and nowadays the interest is focused on the development of chemical reactions that consume the minimum amount of raw material and generate the minimum amount of waste.

In this context, chlorodehydration of alcohols by in situ activation of the $C-O$ bond in which the hydroxyl group is activated and the formation of $\mathrm{X}-\mathrm{OH}$ bond compensates for $C-O$ cleavage has been extensively studied (Scheme 72). ${ }^{273}$

Scheme 72. Conventional strategy for the synthesis of alkyl chlorides: chlorodehydration of alcohols by $\mathrm{S}_{\mathrm{N}} 2$ substitution.

A range of transformations have been developed in this field and among them, the Appel reaction is highlighted which makes use of triphenylphosphine and tetrahalomethanes $\left(\mathrm{CCl}_{4}, \mathrm{CBr}_{4}\right)$ with alcohols to convert them into the corresponding alkyl halides under mild conditions (Scheme 73). ${ }^{274}$ Recently, some catalytic variants of the Appel reaction ${ }^{275}$ and some other innovative catalytic chlorodehydration platforms

[^78]have been reported. ${ }^{276}$ Nevertheless, some limitations remain in these strategies such as the formation of side products, narrow substrate scope, reactivity issues and the use of multiple reagents.

Scheme 73. The Appel reaction.
$\mathrm{sp}^{3}$ Hybridized $C-S$ bonds are generally weaker than the corresponding $C-O$ bonds and furthermore, can be more reactive towards nucleophiles by sulfur oxidation to sulfonium ions. This methodology has been employed in the desulfurative fluorination of thioacetals, dithioacetals and trithioorthoesters affording mono- or di-flurorinated compounds following the mechanism shown in Scheme 74. ${ }^{277}$ The basic idea involves the activation of the $C-S$ bond by an electrophile, followed by a nucleophilic substitution with fluoride to form the $C-F$ bond. In the case of a substrate having a $C=S$ double bond, double desulfurization-fluorination occurs to give difluoromethylene compounds.

Scheme 74. Oxidative desulfurization-fluorination of organosulfur compounds.
The analogous desulfurative chlorination has been less developed; as an example Diakur and co-workers reported the chlorination of thioglycosides to glycosyl chlorides

[^79]via chlorosulfonium salts (Scheme 75). ${ }^{278}$ The salt from phenyl sulfoxide/oxalyl chloride $\mathbf{1 7 0}$ was found to be an efficient chlorine transfer reagent and yields of glycosyl chlorides were typically $>90 \%$ according to ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude product.

Scheme 75. Desulfurative chlorination of thioglycosides to glycosyl chlorides.

However, direct halogenative $C-S$ bond cleavage without neighbouring group participation or anchimeric assistance, which involves the interaction of an electron pair of geminal heteroatoms, has been little studied. In most cases activated alkyl aryl sulfides have been used in desulfurative fluorinations wherein the $C-S$ bond is activated through oxidative $S$-methylation, ${ }^{279} S$-nitrosylation ${ }^{280}$ or $S$-halogenation. ${ }^{277}$

In contrast, very few examples of the analogous chlorination have been reported. Cordts described the addition of chlorine to propylene sulfide $\mathbf{1 7 1}$ causing ring cleavage at the primary carbon-sulfur bond to give access to bis-(1-methyl-2-haloethyl) disulfides 173 (Scheme 76, a). ${ }^{281}$ The mechanistic proposal is the addition of one molecule of chlorine to a molecule of sulfide $\mathbf{1 7 1}$ to form 1-halo-2-propanesulfenyl halide $\mathbf{1 7 2}$. Subsequently, a rapid reaction of this compound with another molecule of propylene sulfide provides the final disulfides 173. Likewise, ring opening chlorinolysis of thiacyclobutane 174 was reported to occur with sulfuryl chloride $\left(\mathrm{SO}_{2} \mathrm{Cl}_{2}\right)$ affording $\gamma$ chloropropanesulfenyl chloride 175 (Scheme 76, b). ${ }^{282}$

[^80]

Scheme 76. Direct chlorination of $C-S$ bonds a) in propylene sulfide and b) in thiacyclobutane.

### 4.2. Hypervalent iodine reagents

Hypervalent iodine reagents have shown to possess a broad oxidative reactivity profile since their discovery in the 1880s. ${ }^{283}$ Among (dichloroiodo)arenes, (dichloroiodo)benzene is the most commonly used reagent which can be conveniently prepared by direct chlorination of iodobenzene (Scheme 77). ${ }^{284}$ Their reactions typically occur under mild and environmentally benign conditions, and have been well documented by Stang and Zhdankin. ${ }^{285}$ The overall geometry of molecule RIL $_{2}$ is a distorted trigonal bipyramid with two heteroatom ligands $(\mathrm{L}=\mathrm{Cl})$ occupying the apical positions and the least electronegative carbon ligand $(\mathrm{R}=\mathrm{Ph})$ and both electron pairs reside in equatorial positions.

Scheme 77. General procedure for the synthesis of (dichloroiodo)benzene and its trigonal bipyramid geometry.

[^81]
### 4.3. Working hypothesis and synthetic plan

It is known that reaction of primary alkyl phenyl sulfides with chlorinating agents forms phenyl $\alpha$-chlorosulfides from chloro-Pummerer rearrangement. ${ }^{286}$

Scheme 78. Chloro-Pummerer rearrangement of alkyl sulfides.

The Pummerer rearrangement is the transfer of functionality from sulfur to carbon, in this case a migration of a chloride atom. Initial attack on sulfide $\mathbf{1 7 6}$ produces the $S$-chlorosulfonium ion $\mathbf{1 7 7}$ whose conversion to chlorosulfide $\mathbf{1 7 8}$ has been described by Bordwell and Pitt ${ }^{282}$ as "riding downhill from sulfur to carbon on an electron cloud". Two mechanistic extremes of how this may be brought about are illustrated in Scheme 79. Which pathway will be favored in any particular situation will be influenced by structural considerations, such as the acidity of the $\alpha$-carbon atom, and the choice of chlorinating agent since the basicity of the anion $\mathrm{Cl}^{-}$is also implicated.

Scheme 79. Mechanistic proposal for the chloro-Pummerer rearrangement.
To the best of our knowledge, the few other examples make use of activated phenyl sulfides capable of generating stable carbenium ion intermediates.

The reaction of (dichloro)iodobenzene with sulfides was reported by Schreiber and Fernández for the first time in which two different reactivity patterns were described depending on the starting sulfides. ${ }^{287}$ Decomposition of the chlorosulfonium chloride intermediate $\mathbf{1 7 7}$ can occur in one of two ways depending on the nature of the organic groups attached to the sulfur atom. When one group is phenyl, benzyl or methyl, and the other is methyl or benzyl, the intermediate reacts with the evolution of hydrogen chloride

[^82]to give the $\alpha$-chloro sulfide $\mathbf{1 7 8}$ (Scheme 80 , path a). A second path by which the chlorosulfonium ion 177 could decompose is by ionization of the intermediate to the sulfenyl halide and the carbonium ion (Scheme 80, path b). Here, there are factors that stabilize a carbonium ion greatly favoring this path. It is for this reason that trityl sulfide gives almost quantitative yields of trityl chloride since one of the group is triphenylmethyl group which contributes a large steric effect and stabilizes by resonance.

Chlorination products:

Path a

Path b

Scheme 80. Two paths of the decomposition of the chlorosulfonium chloride intermediate.

We reasoned that (dichloroiodo)benzene $\left(\mathrm{PhICl}_{2}\right)$ could be a suitable chlorinating agent for its capacity to act as both the oxidant and the source of weakly basic chloride ion. This chlorinating agent would in situ generate a chlorosulfonium intermediate in which a chloride displacement through $\mathrm{S}_{\mathrm{N}} 2$ substitution or $\alpha$-proton abstraction to the thionium ion (or Pummerer) intermediate could occur.

Scheme 81. Proposed chlorination strategy of sulfides with (dichloroiodo)benzene.

### 4.4. Results and discussion

We start our studies with activated secondary alkyl phenyl sulfides. For that purpose some alkyl phenyl sulfides $\mathbf{1 8 1}$ were prepared from the corresponding alcohols $\mathbf{1 8 0}$ with thiophenol and zinc iodide following a described procedure (Scheme 82). ${ }^{288}$

Scheme 82. Preparation of alkyl phenyl sulfides.
(Dichloroiodo)arenes are generally light and heat sensitive yellow crystalline solids which are insufficiently stable for extended storage even at low temperatures. Therefore their quality could affect the experiments, so $\mathrm{PhICl}_{2}$ samples were freshly prepared or used within two weeks of preparation in order to ensure lower traces of HCl .

It was gratifying to observe that 181a reacted with $\mathrm{PhICl}_{2}$ (1.1 equiv.) in dry dichloromethane at room temperature (Table 23). A color change from yellow to orange occurred within 5 minutes indicating the rapid consumption of the starting material.

Once known optimized conditions for chlorination reaction, a range of secondary alkyl sulfides were tested and complete conversions to the chlorinated products within 5 minutes were obtained (Table 23). Chloride 182a was isolated in good yield (71\%) after column chromatography; however, attempts to purify crude chlorides $\mathbf{1 8 2 b}$ and $\mathbf{1 8 2}$ c by column chromatography on silica gel or neutral alumina resulted in partial hydrolysis or decomposition. Being so sensitive these chlorides to column chromatography, we decided to isolate them as their corresponding trifluoroethyl ether derivatives $\mathbf{1 8 3} .{ }^{289}$ It was gratifying to observe that solvolysis of crude chlorides $\mathbf{1 8 2 b}$ and 182c in 2,2,2trifluoroethanol gave good yields (70-79\%) of trifluoroethyl ethers 183b- $\mathrm{OCH}_{2} \mathrm{CF}_{3}$ and $183 \mathrm{c}-\mathrm{OCH}_{2} \mathrm{CF}_{3}$.

[^83]Table 23. Desulfurative chlorination of alkyl phenyl sulfides $\mathbf{1}$ with $\mathrm{PhICl}_{2} .{ }^{[a]}$

( $\pm$ )182a, 71\%

[a] Reactions performed on 0.5 mmol scale at $0.17 \mathrm{M} \mathrm{(3mL)} \mathrm{}$. chromatography. [b] Isolated yield of the corresponding trifluoroethyl ether derivative.

Moreover, it is remarkable that chlorination reaction of sulfide 181d worked satisfactorily with $85 \%$ yield demonstrating that reaction scope includes tertiary phenyl sulfides (Table 23).

Having established that simple phenyl sulfides $\mathbf{1 8 1}$ underwent desulfurative chlorination, we proceeded to examine sulfa-Michael derived phenyl sulfides. A variety of $\beta$-sulfido (thio)ester compounds $\mathbf{1 8 6}$ were prepared through simple sulfa-Michael reaction between acrylates 184 and thiol 185 promoted by triethylamine at room temperature.

Scheme 83. Preparation of $\beta$-sulfido (thio)esters.

According to conditions on Table 23, chlorination reaction of these substrates also turned out to be rapid and in high yields (Table 24). Reaction scope included $\beta$-sulfido esters 186a-h with some electron-withdrawing and donors groups, and $\beta$-sulfido thioester 186i. Interestingly, thioester 186 i having two electronically modified phenylsulfenyl groups also underwent the chlorination in $78 \%$ yield. Finally, the chlorination of sulfide 186 g was conducted on a 5.0 mmol scale and, gratifyingly, gave a comparable yield of chloride $\mathbf{1 8 7} \mathbf{g}$. However, the chlorination of substrates $\mathbf{1 8 6 j}$-o carrying $-\mathrm{CN},-\mathrm{CF}_{3},-\mathrm{OH}$
and $-\mathrm{NO}_{2}$ groups in the aromatic ring provided a mixture of different compounds making impossible the isolation of the corresponding chlorinated products $\mathbf{1 8 7 j} \mathbf{j} \mathbf{0}$.

[a] Reactions performed on 0.5 mmol scale at $0.17 \mathrm{M}(3 \mathrm{~mL})$. Isolated yield after column chromatography. [b] Isolated yield of the corresponding trifluoroethyl ether derivative. [c] Reaction performed on 5.0 mmol scale. [d] Yield not determined, messy crude.

Given the importance of chiral chlorinated products, interest was then focused on the development of methods that deliver aryl chlorides with high enantiopurity. For this purpose we selected $\beta$-sulfido ester $\mathbf{1 8 6 g}$ as substrate, which was synthesized by sulfaMichael addition to $\alpha, \beta$-unsaturated ester following reported protocols. ${ }^{290}$ Initial experiments carried out by S. Lancianesi involving $\beta$-sulfido ester ( $S$ ) $\mathbf{- 1 8 6 g}$ of $\mathbf{9 7 \%} e e$, gave the corresponding inverted chloride $(R)-\mathbf{1 8 7} \mathbf{g}$ in $86 \%$ yield and $84 \% e e$, determining that reaction proceeded with high stereoespecificity (87\%) (Scheme 84). Likewise, $\beta$ -

[^84]sulfido amide ( $S$ )-189 was converted into $\beta$-chloro amide $(R)$ - $\mathbf{1 9 0}$ in $89 \%$ ee and $\mathbf{9 2 \%}$ es. Moreover, a single recrystallization allowed the isolation of $(R)$ - $\mathbf{1 9 0}$ in $59 \%$ yield and $94 \% \mathrm{ee}$. The absolute configuration was confirmed by X-ray analysis to be $R$ indicating that the chlorination proceeded with inversion at the sulfide stereocenter.

Scheme 84. Chlorination of enatioenriched phenyl sulfides $(S)$ - $\mathbf{1 8 6 g}$ and ( $S$ )-189.

Mechanistic hypothesis for the presented desulfurative chlorination is outlined in Scheme 85 . The capacity of aryl- $\lambda^{3}$-iodanes to oxidize organoelement compounds of groups 15 and 16 transfering one ${ }^{291}$ or both ${ }^{292}$ heteroatom ligands is well established. ${ }^{293}$ The latter case is favored when both ligands are the same and of moderate trans-influence on hypervalent bonding ${ }^{294}$ and it is applied for reactions with $\mathrm{PhICl}_{2}{ }^{295} \mathrm{~A}$ generation of highly reactive dichloro- $\lambda^{4}$-sulfurane $\mathbf{1 9 2}$ in equilibrium with its diastereomeric

[^85]chlorosulfonium salt $\mathbf{1 9 3}^{296}$ as key intermediates is proposed. ${ }^{297}$ In principle iodosulfonium adduct 191 can serve as a precursor to intermediates 192 and 193. However, to the best of our knowledge, such intermediates have never been characterized. Due to the absence of Lewis acids capable of binding chloride ion, this equilibrium is likely displaced to the side of sulfurane $\mathbf{1 9 2}$. ${ }^{298}$

(R)-SPh
$\downarrow$

191

(R)-Cl
(S)-Cl
( $R, S$ )-CI

Scheme 85. Mechanistic hypothesis for the desulfurative chlorination.

Chloride ion displacement of PhSCl from intermediates 192 or 193 by $\mathrm{S}_{\mathrm{N}} 2$ mechanism furnishes the desired inverted chloride $(S)-\mathrm{Cl}$ (path a or a'). Alternative pathways from carbenium ion 194 (path $\mathbf{b}$ ), or concerted ligand coupling (1,2-chloride shift) from sulfurane 192 via 195 (path $\mathbf{c}$ ), which is expected to proceed with retention of configuration, would generate the undesired chloro-enantiomer $(R)-\mathrm{Cl}$.

In conclusion, a novel chlorination reaction from phenyl sulfides and $\beta$-sulfido (thio)esters has been developed. This rapid transformation enables the preparation of

[^86]activated alkyl chlorides and $\beta$-chloride (thio)esters under very mild reaction conditions. Moreover, preliminary results show that the reaction proceeds with high stereoespecifity, making it possible for the synthesis of optically active benzylic chlorides from easily accessible enantioenriched sulfa-Michael adducts.

Chapter 5

## 5. CONCLUSIONS

Highly stereoselective reactions involving the generation of all-carbon quaternary and $C-N$ tetrasubstituted carbons have been developed via bifunctional Brønsted base catalyzed Michael addition of two types of challenging $C$-nucleophiles as $\alpha$-substituted cyanoacetates and azlactones to $\alpha$ 'oxy enones as key enoate surrogates. Parallel experiments using simple enones or esters and the respective $\alpha^{\prime}$-oxy enones indicate that the $\alpha$ '-oxy ketone moiety is crucial for achieving high levels of reactivity and stereoselectivity. The resulting $\alpha^{\prime}$-oxy ketone adducts can smoothly be converted into the corresponding carboxylic acid derivatives, ketones or aldehydes.

Excellent results have been observed in the Michael addition of $\alpha$-substituted cyanoacetates to $\alpha$ '-oxy enones with different substitution patterns ( $\beta$ - and $\alpha$-substituted). The corresponding adducts containing adjacent tertiary quaternary stereocenters or nonadjacent tertiary quaternary stereocenters have been satisfactorily constructed through a Brønsted base catalyzed Michael reaction. Furthermore, azlactones have also demonstrated to be adequate substrates for this type of reaction with non-substituted $\alpha^{\prime}$ oxy enones. The present methodology provides access to synthetically relevant building blocks bearing a fully substituted stereogenic carbon atom in enantioenriched form.

On the other hand, 4 -substituted pyrrolidin-2,3-diones have been employed as efficient new Michael donor templates with various electrophiles in the conjugate addition promoted by Brønsted base catalysts. Moreover, an approach to obtain $\beta^{2,2}{ }_{-}$ amino acid derivatives has been described which is suitable for the incorporation of these units into peptides through previous transformation into $N$-carboxyanhydrides.

Finally, a mild and rapid methodology has been established for the obtention of alkyl benzylic chlorides and $\beta$-chloro (thio)esters carrying out the oxidative desulfurative chlorination with (dichloroiodo)benzene. The reaction proceeds with high stereospecificity, making it useful for the synthesis of optically active species from enantioenriched sulfa-Michael adducts.

All these protocols provide interesting products for further transformations and open the way to the development of other related protocols.

6.2. GENERAL PROCEDURE FOR THE SYNTHESIS OF $\alpha \alpha^{\prime}-O X Y$ ENONES ..... 186
6.2.1. Preparation of $\alpha^{\prime}$-hydroxy enone 18 ..... 186
6.2.2. Preparation of 4-methyl-4-((trimethylsilyl)oxy)pent-1-en-3-one 88 ..... 187
6.2.3. Preparation of alkyl-substituted $\alpha^{\prime}$-hydroxy enones 60A-F ..... 188
6.2.3.1. Preparation of (3-methyl-2-oxo-3-trimethylsilyloxybutyl) phosphonic acid dimethyl ester 31 ..... 188
6.2.3.2. Preparation of enones $\mathbf{6 3}$ and their desilylation to $\mathbf{6 0}$ ..... 189
6.2.4. Preparation of aryl-substituted $\alpha^{\prime}$-hydroxy enone 60G ..... 190
6.2.5. Preparation of 4-hydroxy-2,4-dimethylpent-1-en-3-one 61 ..... 191
6.3. PREPARATION OF CATALYSTS ..... 192
6.3.1. Thiourea and urea containing Brønsted base catalysts C9 and C39 ..... 193
6.3.2. Squaramide-based Brønsted catalysts C4, C42, C43 and C60 ..... 196
6.3.2.1. Preparation of common squaric ester monoamide intermediate ..... 196
6.3.2.2. Preparation of catalyst C4 ..... 197
6.3.2.3. Preparation of catalyst C42 ..... 197
6.3.2.4. Preparation of catalyst C43 ..... 198
6.3.2.5. Preparation of catalyst C60 ..... 200
6.3.3. Ureidopeptide-like Br . ..... 203
6.3.3.1. Preparation of the $N$-((benzyloxy)carbonyl)-L-tert-leucine ..... 203
6.3.3.2. Preparation of N -Cbz-L-tert-leucine derived isocyanate and coupling with 9-amino-(9-deoxy)epiquinine ..... 204
6.3.4. Representative NMR spectra ..... 206
6.4. EXPERIMENTAL SECTION OF CHAPTER 2 ..... 213
6.4.1. Preparation of pronucleophiles ..... 213
6.4.1.1. Synthesis of cyanoacetates 44a-h ..... 213
6.4.1.2. Synthesis of racemic azlactones 81-87 ..... 215
6.4.2. Conjugate addition of $\alpha$-cyanoacetates to $\beta$-substituted $\alpha^{\prime}$-hydroxy enones ..... 223
6.4.2.1. Asymmetric reaction ..... 223
6.4.2.2. Racemic reaction ..... 223
6.4.2.3. Characterization data for compounds 64 ..... 223
6.4.2.4. Elaboration of adducts $\mathbf{6 7}, \mathbf{7 1}$ and $\mathbf{7 2}$ ..... 228
6.4.2.4.1.To carboxylic acids 67 ..... 228
6.4.2.4.2.To ketones 71-72 ..... 229
6.4.3. Conjugate addition of $\alpha$-cyanoacetates to $\alpha$-methyl $\alpha^{\prime}$-hydroxy enone 61 ..... 231
6.4.3.1. Asymmetric reaction ..... 231
6.4.3.2. Racemic reaction ..... 231
6.4.3.3. Characterization data for compounds 79a-f ..... 231
6.4.3.4. General procedure for the addition to 3-methylbut-3-en-2-one as Michael acceptor ..... 234
6.4.3.5. Elaboration of adducts ..... 235
6.4.3.5.1.To carboxylic acid 80 ..... 235
6.4.3.5.2.To aldehyde 78 ..... 235
6.4.4. ORTEP diagram of compound 79b ..... 236
6.4.5. Conjugate addition of azlactones to $\alpha^{\prime}$-trimethylsilyloxy enone 88 ..... 237
6.4.5.1. Asymmetric reaction ..... 237
6.4.5.2. Racemic reaction ..... 237
6.4.5.3. Characterization data for compounds 89-95 ..... 238
6.4.5.4. Elaboration of adducts 89 into carboxylic acids 97 ..... 243
6.4.5.5. Synthesis of glutamic acid analogue 98 ..... 245
6.4.6. Computational studies ..... 246
6.4.7. Representative NMR spectra ..... 261
6.4.8. HPLC chromatograms ..... 308
6.5. EXPERIMENTAL SECTION OF CHAPTER 3 ..... 336
6.5.1. Synthesis of 4-substituted pyrrolidin-2,3-diones ..... 336
6.5.1.1. Synthesis of acrylates ..... 336
6.5.1.2. Addition of amines to acrylates: $\beta$-Amino esters synthesis ..... 339
6.5.1.3. Cyclization/decarboxylation reaction ..... 342
6.5.2. Conjugate addition of 4 -substituted pyrrolidin-2,3-diones to methyl vinyl ketone and $\alpha^{\prime}$-oxy enones ..... 344
6.5.2.1. Asymmetric addition to vinyl ketones ..... 344
6.5.2.2. Asymmetric reaction to $\alpha^{\prime}$-oxy enones ..... 345
6.5.2.3. Racemic reactions ..... 345
6.5.2.4. Characterization data for compounds 151,152 and 153 ..... 346
6.5.3. $\alpha$-Amination of pyrrolidin-2,3-diones with di-tert-butyl azodicarboxylate ..... 349
6.5.3.1. Asymmetric reaction ..... 349
6.5.3.2. Racemic reaction ..... 349
6.5.3.3. Characterization data for compounds 154-157 ..... 349
6.5.4. Michael addition of pyrrolidin-2,3-diones to 1,1-bis(phenylsulfonyl)ethylene ..... 352
6.5.4.1. Asymmetric reaction ..... 352
6.5.4.2. Racemic reaction ..... 353
6.5.4.3. Characterization data for compound 161 ..... 353
6.5.5. Elaboration of the adducts ..... 353
6.5.5.1. To carboxylic acid 162 and ester 163 ..... 353
6.5.5.2. To NCAs and ring opening with amines ..... 355
6.5.5.3. To dicarboxylic acid 167 ..... 357
6.5.6. ORTEP diagram for compounds 153a and 154b ..... 359
6.5.7. Representative NMR ..... 360
6.5.8. HPLC chromatograms ..... 392
6.6. EXPERIMENTAL SECTION OF CHAPTER 4 ..... 406
6.6.1. Preparation of (dichloro)iodobenzene $\mathrm{PhICl}_{2}$ ..... 406
6.6.2. Preparation alkyl sulfides ..... 406
6.6.3. Preparation $\beta$-sulfido (thio)esters compounds ..... 408
6.6.3.1. Preparation of acrylates 184 ..... 408
6.6.3.2. Sulfa-Michael addition of thiophenol to acrylates $\mathbf{1 8 4}$ ..... 412
6.6.4. Desulfurative chlorination of alkyl phenyl sulfides with $\mathrm{PhICl}_{2}$ ..... 416
6.6.5. Desulfurative chlorination of sulfa-Michael derived sulfides with $\mathrm{PhICl}_{2}$ ..... 418
6.6.6. Representative NMR spectra ..... 422

## 6. EXPERIMENTAL SECTION

### 6.1. MATERIAL AND TECHNIQUES

### 6.1.1. Reagents and solvents

Reagents were purchased from different commercial suppliers (Aldrich, Acros, Alfa Aesar, Fluka, TCI, Merck, etc.), stored as specified by the manufacturer and used without previous purification unless otherwise stated.

Triethylamine, DBU and DIPEA were purified by distillation. Liquid aldehydes were purified by distillation before usage and stored in the fridge at $-30{ }^{\circ} \mathrm{C}$ under nitrogen.

When anhydrous solvents were required, they were dried following established procedures. ${ }^{299}$ Dichloromethane was dried over $\mathrm{CaH}_{2}$, and diethyl ether and tetrahydrofuran were dried by filtration through activated alumina (powder $\approx 150$ mesh, pore size $58 \AA$, basic, Sigma aldrich) columns.

### 6.1.2. General experimental

All non-aqueous reactions were performed using oven-dried glassware and were magnetically stirred. Yields refer to chromatographically purified and spectroscopically pure compounds, unless otherwise stated.

Heat requiring reactions were performed using a hotplate with a sand bath and a condenser. Reactions requiring low temperatures were performed using cooling bath circulators Huber T100E and acetone or isopropanol baths.

Organic layers washed with aqueous phases were dried over $\mathrm{MgSO}_{4}$ or $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered through cotton.

Organic solvents were evaporated under reduced pressure using rotavapors Büchi R-110, R-200 and R-210, the latter equipped with a Büchi V-700 vacuum pump and a Büchi V-850 vacuum controller, appropriate for the evaporation of solvents when products were volatile compounds. For the complete removal of solvents vacuum pump Telstar Top-3 ( $\sim 0.5 \mathrm{mmHg}$ ) was employed.

[^87]
### 6.1.3. Chromatography

Reactions and flash chromatographic columns were monitored by thin layer chromatography (TLC) using Merck silica gel 60 F254 plates and visualized by fluorescence quenching under UV light, Fisher Bioblock lamp VL-4LC, $\lambda=254$ and 365 nm . In addition, TLC plates were stained with a dipping solution of potassium permanganate ( 1 g ) in 100 ml of water (limited lifetime), followed by heating.

Chromatographic purification was performed on Merck ROCC 60 silica gel 40-63 $\mu \mathrm{m}$ as stationary phase and a suitable mixture of solvents (typically hexane/ethyl acetate, pentane/diethyl ether or dichloromethane/methanol) as eluent.

Optical rotations were recorded using a Jasco P-2000 polarimeter; specific rotation (SR) ([ []$_{\mathrm{D}}$ ) are reported in $10^{-1} \mathrm{deg} \cdot \mathrm{cm}^{2} \cdot \mathrm{~g}^{-1}$; concentrations (c) are quoted in $\mathrm{g} / 100 \mathrm{~mL}$; D refers to the D-line of sodium ( 589 nm ); temperatures ( T ) are given in degree Celsius ( ${ }^{\circ} \mathrm{C}$ ).

### 6.1.4. Melting points

Melting points were determined in open capillaries in a Stuart SHP3 melting point apparatus and microscope and were uncorrected.

### 6.1.5. NMR spectra

NMR spectra were recorded using a Bruker Avance 300 ( 300 MHz for ${ }^{1} \mathrm{H}, 75$ MHz for ${ }^{13} \mathrm{C}$ ) spectrometer, Bruker 400 spectrometer $\left(400 \mathrm{MHz}\right.$ for ${ }^{1} \mathrm{H}, 100 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ) or Bruker AV-500 spectrometer ( 500 MHz for ${ }^{1} \mathrm{H}, 125 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ). Chemical shifts ( $\delta$ ) are quoted in parts per million referenced to the residual solvent peak, usually $\mathrm{CDCl}_{3},{ }^{1} \mathrm{H}$ ( $\delta=7.26$ ) and ${ }^{13} \mathrm{C}(\delta=77.0)$. The multiplicity of each signal is designated using the following abbreviations: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; brs, broad singlet. Coupling constants ( $J$ ) are reported in Hertz (Hz).

MestrReNova Mnova 8.1 program was used to process and edit the registered spectra.

### 6.1.6. Mass spectra

MS spectra were recorded on an ESI-ion trap Mass spectrometer (Agilent 1100 series LC/MSD, SL model) on a UPLC-DAD-QTOF, Ultra High Performance Liquid Chromatography-Mass spectrometer, Waters UPLC ACQUITY, Waters PDA detector, Waters Sunapt G2 or on an Agilent Thermoquest LCT spectrometer. Mass spectrometry
analyses were performed in the General Research Service (SGIker) of the University of the Basque Country (UPV/EHU) or in the Royal Collegue of Surgeons of Ireland (RCSI).

### 6.1.7. Infrared spectra

Infrared spectra were recorded on a Bruker Alpha FT-IR spectrometer as a thin film. Only selected maximum absorbances are reported.

### 6.1.8. Determination of enantiomeric excesses

Enantiomeric excesses were determined using analytical high performance liquid chromatography (HPLC) performed on either a Waters 600 (equipped with Photodiode Array Detector Waters 2996). The used columns were AD-H, AD-3, AY-H, AS-H, IA, IC and Phenomenex Lux $3 \mu$ Cellulose-4; and flow/solvent conditions are given for each compound.

### 6.1.9. X-Ray diffraction analysis

The X-ray diffraction analysis experiments were conducted in the General Research Service (SGIker) of the University of the Basque Country (UPV/EHU) using difractometers for monocrystals.

### 6.1.10. Computational studies

All structures were optimized using the functional B3LYP39 ${ }^{300}$ and the $6-31 G^{*}$ basis set as implemented in Gaussian 09. ${ }^{301}$ All energy minima and transition structures were characterized by frequency analysis. The stationary points were characterized by frequency calculations in order to verify that they have the right number of negative

[^88]eigenvalues. The intrinsic reaction coordinates (IRC) ${ }^{302}$ were followed to verify the energy profiles connecting each transition state to the correct associated local minima. The energies reported in this work include single-point calculations at M06-2X/6$311++G^{* *}$ level on the IEF-PCM solvation model (solvent $=$ dichloromethane), ${ }^{303}$ using the previously optimized gas-phase structures (B3LYP/6-31G*).

### 6.2. GENERAL PROCEDURE FOR THE SYNTHESIS OF $\alpha$ '-OXY ENONES

### 6.2.1. Preparation of $\alpha$ '-hydroxy enone 18

METHOD A: ${ }^{304}$ To a solution of methoxypropadiene ( $3.50 \mathrm{~g}, 50 \mathrm{mmol}$ ) in dry $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{~mL})$ at $-40{ }^{\circ} \mathrm{C}, n \mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, 22 mL , 55 mmol$)$ was added under nitrogen and the reaction was stirred at $-40^{\circ} \mathrm{C}$ for 10 min . Then, acetone $(4.04 \mathrm{~mL}, 55$ $\mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(55 \mathrm{~mL})$ was added within 5 min . The reaction was stirred at the same temperature for 0.5 h and quenched with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$. The resulting mixture was allowed to warm to room temperature and extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( 3 x 100 mL ). The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to afford 2-methyl-3-methoxy-3,4-pentadien-2-ol as a yellow liquid ( $5.65 \mathrm{~g}, 41.0$ $\mathrm{mmol}, 82 \%$ ) that was employed in the next step without further purification.

The material from previous step (2-methyl-3-methoxy-3,4-pentadien-2-ol, 5.65 g , $44 \mathrm{mmol})$ was added dropwise to $5 \%$ aq $\mathrm{H}_{2} \mathrm{SO}_{4}(110 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ and the mixture was stirred for 1.5 h . After this time the reaction was allowed to warm to room temperature and the solution was saturated with solid NaCl . The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{x}$ 60 mL ) and the combined extracts were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed to give a yellow oil which upon distillation afforded the enone as a colorless liquid ( $4.42 \mathrm{~g}, 38.7 \mathrm{mmol}, 88 \%$ ) b.p. $45^{\circ} \mathrm{C}(13 \mathrm{mmHg})$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 3445$

[^89]$(\mathrm{OH}), 1693(\mathrm{C}=\mathrm{O}) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 6.73(\mathrm{dd}, J=9.5,16.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.50(\mathrm{dd}, J=2.2$, $16.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.82(\mathrm{dd}, J=2.2,10.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.38(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 202.3$, 131.1, 128.8, 75.4, 26.1.

METHOD B: ${ }^{305}$ Commercially available 3-hydroxy-3-methyl-2-butanone (1 equiv., $5.3 \mathrm{~mL}, 50 \mathrm{mmol}$ ) and paraformaldehyde ( 2 equiv., $3 \mathrm{~g}, 100 \mathrm{mmol}$ ) were added to a solution of ${ }^{i} \operatorname{Pr}_{2} \mathrm{NH}$ ( 2 equiv., $14.0 \mathrm{~mL}, 100 \mathrm{mmol}$ ) and TFA ( 2.5 equiv., $9.6 \mathrm{~mL}, 125$ mmol ) in THF ( 250 mL ). The mixture was refluxed and paraformaldehyde ( 2 equiv., 3 g , 100 mmol ) was added every 2 h three times. The mixture was stirred at reflux overnight and then was cooled to room temperature. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ was added and the mixture was washed with $1 \mathrm{~N} \mathrm{HCl}(75 \mathrm{~mL}), 1 \mathrm{~N} \mathrm{NaOH}(75 \mathrm{~mL})$ and brine ( 75 mL ), and the organic layer was dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure ( $230 \mathrm{mbar} /$ bath $40^{\circ} \mathrm{C}$ ). The residue was purified by flash column chromatography on silica gel (eluent: diethyl ether) to afford 4-hydroxy-4-methylpent-1-en-3-one as colorless oil. Yield: $5.0 \mathrm{~g}, 44.5 \mathrm{mmol}, 89 \%$.

### 6.2.2. Preparation of 4-methyl-4-((trimethylsilyl)oxy)pent-1-en-3-one $\mathbf{8 8}^{306}$

3-(Trimethylsilyl)-2-oxazolidinone (TMSO) ( 1.5 equiv., $3.4 \mathrm{~mL}, 22.5 \mathrm{mmol}$ ) and 3 drops of trifluoromethanesulfonic acid were added to enone 18 ( 1 equiv., $1.68 \mathrm{~g}, 15$ mmol ). The reaction mixture was stirred at room temperature for 2 h , diluted with pentane $(20 \mathrm{~mL})$ and subsequently washed with water $(20 \mathrm{~mL})$ and $\mathrm{NaHCO}_{3}$ sat. ( 20 mL ). The organic phase was then dried over with $\mathrm{MgSO}_{4}$ and concentred under reduced pressure to afford the title compound $\mathbf{8 8}$ as a colorless oil. Yield: $2.6 \mathrm{~g}, 14.0 \mathrm{mmol}, 93 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.03(\mathrm{dd}, J=17.3,10.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.38(\mathrm{dd}, J=17.3,2.1 \mathrm{~Hz}, 1 \mathrm{H})$, $5.72(\mathrm{dd}, J=10.4,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.37(\mathrm{~s}, 6 \mathrm{H}), 0.14(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 202.8, 130.7, 129.2, 79.3, 27.2, 2.3.

[^90]
### 6.2.3. Preparation of alkyl-substituted $\boldsymbol{\alpha}^{\prime}$-hydroxy enones $60 \mathrm{~A}-\mathrm{F}^{307}$

6.2.3.1. Preparation of (3-methyl-2-oxo-3-trimethylsilyloxybutyl)phosphonic acid dimethyl ester $31{ }^{308}$

Methyl 2-hydroxyisobutyrate $\mathbf{6 2}(6.9 \mathrm{~mL}, 60 \mathrm{mmol})$ was added under a nitrogen atmosphere to a solution of dimethyl amino pyridine ( $1.22 \mathrm{~g}, 10 \mathrm{mmol}$ ), triethylamine ( 10 $\mathrm{mL}, 50 \mathrm{mmol})$ and trimethylchlorosilane ( $6.3 \mathrm{~mL}, 50 \mathrm{mmol}$ ) in 50 mL of dichloromethane. The reaction mixture was stirred at room temperature for 24 hours. After filtering over celite to remove the salt, the filtrate was diluted with diethyl ether $(150 \mathrm{~mL})$ and the resulting solution was washed with brine ( $1 \times 50 \mathrm{~mL}$ ) and water ( $1 \times 50$ mL ). The solvent was removed under reduced pressure to give the corresponding triethylsilyl ether which was used as such without further purification. Yield: 12.6 g ( $92 \%$ ). Dimethyl methyl phosphonate ( $13.8 \mathrm{~mL}, 130 \mathrm{mmol}, 2.5 \mathrm{eq}$ ) in dry THF ( 40 mL ) was added dropwise to a cold solution of $n \mathrm{BuLi}(1.6 \mathrm{M}$ in hexanes, $79 \mathrm{~mL}, 130 \mathrm{mmol})$ in dry THF ( 80 mL ) at $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere. After 30 min of stirring at the same temperature, a solution of the crude trimethylsilyl ether prepared above ( $12 \mathrm{~g}, 51$ $\mathrm{mmol})$ in dry THF ( 100 mL ) was added dropwise at $-78^{\circ} \mathrm{C}$. The mixture was stirred at the same temperature $\left(-78{ }^{\circ} \mathrm{C}\right)$ for 3 h and then quenched at this temperature with a saturated ammonium chloride solution ( 200 mL ). The reaction mixture was allowed to reach room temperature, it was extracted with diethyl ether ( $3 \times 250 \mathrm{~mL}$ ) and dried over $\mathrm{MgSO}_{4}$. The solvent was then evaporated under reduced pressure to get the title compound which was used for the next step without further purification. Yield: 14.6 g (99\%).

[^91]
### 6.2.3.2. Preparation of enones $\mathbf{6 3}$ and their desilylation to $\mathbf{6 0}$

Dried $\mathrm{LiCl}(1.17 \mathrm{~g}, 27 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(3.8 \mathrm{~mL}, 27 \mathrm{mmol})$ were added successively to a solution of (3-methyl-2-oxo-3-trimethylsilyloxybutyl)phosphonic acid dimethyl ester $31(7.95 \mathrm{~g}, 27 \mathrm{mmol})$ in dry $\mathrm{MeCN}(67 \mathrm{~mL})$. The resulting milky suspension was stirred for 15 min at room temperature and the corresponding aliphatic aldehyde ( 27 mmol ) was added dropwise. The mixture was stirred for 40 h , diluted with water and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The crude was dissolved in methanol ( 200 mL ) and a solution of hydrofluoric acid (HF) ( $48 \%$ in water, 5 mL ) was added. The resulting mixture was stirred for 0.5 h at room temperature and then was neutralized by addition of a saturated solution of $\mathrm{NaHCO}_{3}$. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$ and the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and evaporated to afford the crude desilylated product that was purified by flash silica gel chromatography (hexane-EtOAc, 40:1).

## ( $\boldsymbol{E}$ )-2-Hydroxy-2-methyl-7-phenyl-hept-4-en-3-one 60A ${ }^{310 a}$

The general procedure for alkyl-substituted $\alpha^{\prime}$-hydroxy enones was followed using hydrocinnamaldehyde ( $15.2 \mathrm{~mL}, 240$ mmol). Colourless oil. Yield $7.7 \mathrm{~g}, 177 \mathrm{mmol}, 74 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.28-7.21(\mathrm{~m}, 6 \mathrm{H}), 6.41(\mathrm{~d}, J=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{~s}, 1 \mathrm{H}), 2.8(\mathrm{t}, J=8 \mathrm{~Hz}, 2 \mathrm{H})$, 2.59 (m, 2H), 1.34 ( $\mathrm{s}, 6 \mathrm{H}$ ).

## ( $\boldsymbol{E}$ )-2-Hydroxy-2-methylhept-4-en-3-one $60 B^{310 a}$

The general procedure for alkyl-substituted $\alpha$ '-hydroxy enones was followed using $n$-propanal ( $17.5 \mathrm{~mL}, 240 \mathrm{mmol}$ ). Colourless oil. Yield $6.6 \mathrm{~g}, 134 \mathrm{mmol}, 56 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.15(\mathrm{~m}, 1 \mathrm{H}), 6.38(\mathrm{~d}, \mathrm{~J}=15 \mathrm{~Hz}$, $1 \mathrm{H}), 4.0(\mathrm{~s}, 1 \mathrm{H}), 2.27(\mathrm{~m}, 2 \mathrm{H}), 1.36(\mathrm{~s}, 6 \mathrm{H}), 1.08(\mathrm{t}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-2-Hydroxy-2-methyloct-4-en-3-one 60C ${ }^{309}$

The general procedure for alkyl-substituted $\alpha^{\prime}$-hydroxy enones was followed using n-butanal ( $25.7 \mathrm{~mL}, 240 \mathrm{mmol}$ ). Colourless oil. Yield $7.78 \mathrm{~g}, 180 \mathrm{mmol}, 75 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.22-7.10(\mathrm{~m}, 1 \mathrm{H}), 6.46(\mathrm{~d}, J$ $=15.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.09(\mathrm{~s}, 1 \mathrm{H}), 2.30-2.20(\mathrm{~m}, 2 \mathrm{H}), 1.55-1.43(\mathrm{~m}, 2 \mathrm{H}), 1.40(\mathrm{~s}, 6 \mathrm{H}), 0.97$ (t, $J=7.4 \mathrm{~Hz}, 3 \mathrm{H}$ ).

[^92]
## ( ()-2-Hydroxy-2-methylnona-4,8-dien-3-one 60D

The general procedure for alkyl-substituted $\alpha$ '-hydroxy enones was followed using 4-pentenal ( $16.5 \mathrm{~mL}, 240 \mathrm{mmol}$ ). Colourless oil. Yield $6.6 \mathrm{~g}, 156 \mathrm{mmol}, 65 \% .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.14(\mathrm{dt}, J=15.4,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.43(\mathrm{dt}, J=15.3,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.80(\mathrm{ddt}, J=16.6,10.2$, $6.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.13-4.97$ (m, 2H), 3.96 (s, 1H), $2.45-2.32$ (m, 2H), $2.32-2.14$ (m, 2H), $1.38(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 202.4,145.0,137.0,122.8,115.9,75.3,32.1$, 26.5. HRMS (ESI): $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{O}_{2}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 169.1229, found: 169.1216.

## ( $\boldsymbol{E}$ )-2-Hydroxy-2,7-dimethyloct-4-en-3-one 60E ${ }^{310 a}$

The general procedure for alkyl-substituted $\alpha$ '-hydroxy enones was followed using isopentanaldehyde ( $25.7 \mathrm{~mL}, 240 \mathrm{mmol}$ ). Colourless oil. Yield $7.78 \mathrm{~g}, 132 \mathrm{mmol}, 55 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.13$ (dt, $J=$ $15.1,7.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.40(\mathrm{dt}, J=15.3,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{~s}, 1 \mathrm{H}), 2.15$ (ddd, $J=7.4,6.8,1.4$ $\mathrm{Hz}, 2 \mathrm{H}), 1.80(\mathrm{dp}, J=13.4,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.39(\mathrm{~s}, 6 \mathrm{H}), 0.94(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H})$.

## ( E)-1-Cyclohexyl-4-hydroxy-4-methylpent-1-en-3-one $60 \mathrm{~F}^{310 a}$

The general procedure for alkyl-substituted $\alpha^{\prime}$-hydroxy enones was followed using cyclohexylcarbaldehyde ( $29 \mathrm{~mL}, 240 \mathrm{mmol}$ ). Colourless oil. Yield $7.0 \mathrm{~g}, 103.2 \mathrm{mmol}, 43 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.10(\mathrm{dd}, J$ $=15.5,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.36(\mathrm{dd}, J=15.5,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.00(\mathrm{~s}, 1 \mathrm{H}), 2.18(\mathrm{~m}, 1 \mathrm{H}), 1.85-$ $1.64(\mathrm{~m}, 4 \mathrm{H}), 1.38(\mathrm{~s}, 6 \mathrm{H}), 1.33-1.10(\mathrm{~m}, 4 \mathrm{H}), 0.91-0.81(\mathrm{~m}, 2 \mathrm{H})$.

### 6.2.4. Preparation of aryl-substituted $\boldsymbol{\alpha}$ '-hydroxy enone $\mathbf{6 0 G}{ }^{310}$

## ( ()-4-Hydroxy-4-methyl-1-phenylpent-1-en-3-one 60G

3-Hydroxy-3-methyl-2-butanone $15(5.0 \mathrm{~g}, 49 \mathrm{mmol})$ was dissolved in a mixture of $\mathrm{MeOH}(120 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(40 \mathrm{~mL})$. Freshly distilled benzaldehyde ( 87.5 mmol ) was then added followed by $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}(10.28 \mathrm{~g}, 245 \mathrm{mmol})$. The reaction mixture was stirred at reflux for 3 h , and after removal of MeOH under reduced pressure, the aqueous residue

[^93]was diluted with $\mathrm{H}_{2} \mathrm{O}(40 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$. The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extracts were combined, dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by silica gel column chromatography (hexane-EtOAc, 50:1). Colourless oil. Yield $7.0 \mathrm{~g}, 140 \mathrm{mmol}, 60 \%$. All spectroscopic data were consistent with those previously reported. ${ }^{311}{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.83(\mathrm{~d}, J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~m}, 2 \mathrm{H}), 7.40$ $(\mathrm{m}, 3 \mathrm{H}), 7.02(\mathrm{~d}, J=15.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.00(\mathrm{~s}, 1 \mathrm{H}), 1.45(\mathrm{~s}, 6 \mathrm{H})$.

### 6.2.5. Preparation of 4-hydroxy-2,4-dimethylpent-1-en-3-one 61

61
$\mathbf{1}^{\text {st }}$ step: To a solution of methyl 2-hydroxy-2-methylpropanoate ( $1.77 \mathrm{~g}, 15 \mathrm{mmol}$, 1 equiv.) and $N, O$-dimethylhydroxylamine hydrochloride ( $15 \mathrm{mmol}, 1.5$ equiv.) in THF ( 50 mL ), a 2 M solution of ${ }^{i} \mathrm{PrMgCl}$ in THF ( 60 mmol , 4 equiv.) was added at $-20^{\circ} \mathrm{C}$. The reaction mixture was stirred for 1.5 h at room temperature. The reaction was then quenched with an aqueous saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \times 30 \mathrm{~mL}\right.$ ). The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and filtered and the solvent was evaporated under reduced pressure. The crude material was purified by flash column chromatography (eluent hexane/ethyl acetate, 80/20) to obtain the desired amide product as colourless oil. Yield $1.99 \mathrm{~g}, 13.5 \mathrm{mmol}, 90 \%$. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were coincident with those reported in the literature. ${ }^{312}{ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 4.29(\mathrm{~s}, 1 \mathrm{H}), 3.73(\mathrm{~s}, 3 \mathrm{H}), 3.28(\mathrm{~s}, 3 \mathrm{H}), 1.47(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta$ 177.2, 72.1, 61.0, 33.6, 26.5.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p : ~ T o ~ a ~ s o l u t i o n ~ o f ~ t h e ~ s t a r t i n g ~ a m i d e ~ ( ~} 1.85 \mathrm{~g}, 10 \mathrm{mmol}$, 1 equiv.) in $\mathrm{Et}_{2} \mathrm{O}$ $(20 \mathrm{~mL})$, a solution of isopropenyl magnesium bromide ( $0.5 \mathrm{M}, 60 \mathrm{~mL}, 3$ equiv.) was added at $-20^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 16 h . The reaction was quenched with an aqueous saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $2 \times 50 \mathrm{~mL}$ ). The combined organic phases were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude product was purified by flash column chromatography (pentane/ $\mathrm{Et}_{2} \mathrm{O}, 95 / 5$ ) to obtain the desired product 61 as a

[^94]colourless oil. Yield: $833 \mathrm{mg}, 6.5 \mathrm{mmol}, 65 \%$. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were identical to those reported in the literature. ${ }^{313}{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.91(\mathrm{~s}, 1 \mathrm{H}), 5.75(\mathrm{~s}$, $1 \mathrm{H}), 4.11(\mathrm{~s}, 1 \mathrm{H}), 1.86(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 206.3,140.3$, 125.6, 72.0, 28.3, 19.9.

### 6.3. PREPARATION OF CATALYSTS

Catalysts $\mathbf{C 2}$ and (DHQD) ${ }_{2}$ Pyr $\mathbf{C 4 1}$ are commercially available and were purchased from commercial suppliers. Catalysts C4, C9, C39, C42, C43, C59 and C60 were prepared as follows.

Thiourea/urea-based catalysts C9 and C39 were prepared according to the following synthetic sequence:

Squaramide-based catalysts C4, C42, C43 and C60 were prepared according to the following synthetic sequence:

[^95]Ureidopeptide-based catalyst C59 was prepared according to the following synthetic sequence:

6.3.1. Thiourea and urea containing Brønsted base catalysts $\mathbf{C} \boldsymbol{9}^{314}$ and $\mathbf{C 3 9} 9^{315}$

${ }^{314}$ Greenaway, K.; Dambruoso, P.; Ferrali, A.; Hazelwood, A. J.; Sladojevich, F.; Dixon, D. J. Synthesis 2011, 12, 1880-1886.
${ }^{315}$ Adapted from: See ref. 24b, page 17.

## Preparation of 9-amino-(9-deoxy)epiquinine ${ }^{316}$

$\mathbf{1}^{\text {st }}$ step: ${ }^{317}$ A mixture of quinine ( 1 equiv., $16.2 \mathrm{~g}, 50 \mathrm{mmol}$ ) and triethylamine ( 3.6 equiv., $25.1 \mathrm{~mL}, 180 \mathrm{mmol}$ ) in dry THF ( 250 mL ) was cooled to $0^{\circ} \mathrm{C}$ and then methanesulfonyl chloride ( 1.8 equiv., $7.0 \mathrm{~mL}, 90 \mathrm{mmol}$ ) was added dropwise. The mixture was stirred overnight at room temperature. The reaction was quenched with water $(40 \mathrm{~mL})$ and then THF was removed under vacuum. The residue was dissolved in dichloromethane ( 40 mL ) and washed with water ( 30 mL ) and saturated sodium bicarbonate ( 30 mL ). The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentred under vacuum to afford the crude product in $96 \%$ yield, which was used in the next step without further purification.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{318}$ The crude product ( 1 equiv., $19.3 \mathrm{~g}, 48 \mathrm{mmol}$ ) was dissolved in DMF $\left(150 \mathrm{~mL}\right.$ ). The solution was cooled to $0{ }^{\circ} \mathrm{C}$ and $\mathrm{NaN}_{3}$ (2 equiv., $6.2 \mathrm{~g}, 96 \mathrm{mmol}$ ) was added portionwise. The mixture was stirred at $70^{\circ} \mathrm{C}$ for 16 h and after this time the reaction was quenched with water $(80 \mathrm{~mL})$ and then ethyl acetate $(150 \mathrm{~mL})$ was added. The organic layer was separated and washed with saturated NaCl thoroughly ( $5 \times 60 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$, filtered and evaporated under reduced pressure to obtain the crude product in quantitative yield, which was used in the next step without further purification.

[^96]$3^{\text {rd }}$ step: ${ }^{318}$ The crude product was dissolved in THF ( 250 mL ) and $\mathrm{PPh}_{3}$ (1 equiv., $12.6 \mathrm{~g}, 48 \mathrm{mmol}$ ) was added. The reaction mixture was heated to $40^{\circ} \mathrm{C}$ and stirred until the gas evolution ceased ( $\sim 5 \mathrm{~h}$ ). Then $\mathrm{H}_{2} \mathrm{O}(8 \mathrm{~mL})$ was added and the mixture was stirred overnight at $40^{\circ} \mathrm{C}$. The solvent was removed under vacuum and the residue was dissolved in dichloromethane ( 150 mL ). $\mathrm{HCl} 6 \mathrm{M}(250 \mathrm{~mL})$ was added and the aqueous phase was separated and washed with dichloromethane ( $2 \times 100 \mathrm{~mL}$ ). Then the aqueous layer was cooled to $0^{\circ} \mathrm{C}$ and basified until $\mathrm{pH}>10$ with $\mathrm{NaOH} 40 \%$. The aqueous phase was then extracted with dichloromethane ( 3 x 150 mL ), dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure to afford 9-amino-(9-deoxy)epiquinine as a yellow viscous oil. Yield: $8.7 \mathrm{~g}, 26.9 \mathrm{mmol}, 56 \%$. All data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta 8.75(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.36-8.05(\mathrm{~m}, 4 \mathrm{H})$, $5.79(\mathrm{~m}, 1 \mathrm{H}), 4.97(\mathrm{~m}, 2 \mathrm{H}), 4.57(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.97(\mathrm{~s}, 3 \mathrm{H}), 3.02-3.34(\mathrm{~m}, 3 \mathrm{H})$, $2.77(\mathrm{~m}, 2 \mathrm{H}), 2.27(\mathrm{~m}, 1 \mathrm{H}), 2.08(\mathrm{~s}, 2 \mathrm{H}), 1.26-1.63(\mathrm{~m}, 4 \mathrm{H}), 0.80(\mathrm{~m}, 1 \mathrm{H})$.

## General procedure for the coupling of 9-amino-(9-deoxy)epiquinine with isocyanates ${ }^{315}$

To a solution of 9-amino-(9-deoxy)epiquinine ( 1 equiv., $1.6 \mathrm{~g}, 5 \mathrm{mmol}$ ) in dry THF ( 7.5 mL ) at $0{ }^{\circ} \mathrm{C}$, a solution of bis(trifluomethyl)phenyl isothiocyanate (1.1 equiv., $1.5 \mathrm{~g}, 5.5 \mathrm{mmol}$ ) or bis(trifluomethyl)phenyl isocyanate ( 1.1 equiv., $0.6 \mathrm{~mL}, 5.5 \mathrm{mmol}$ ) in dry THF ( 2.5 mL ) was added dropwise. The reaction mixture was stirred overnight at room temperature and then concentrated under reduced pressure. The residue was purified by flash column chromatography on non acid silica gel (eluting with hexane/ ethyl acetate 80/20 $\rightarrow$ ethyl acetate) to afford the title compounds C9 and C39.

## 1-(3,5-Bis(trifluoromethyl)phenyl)-3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)urea $\mathbf{C 9}^{314}$

The title compound C9 was prepared from bis(trifluomethyl)phenyl isocyanate ( $0.6 \mathrm{~mL}, 5.5 \mathrm{mmol}$ ) according to the general procedure. White solid, yield: 2.4 g , $4.1 \mathrm{mmol}, 82 \%$. m. p. $132-134^{\circ} \mathrm{C}$. All data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right)$ $\delta 8.58(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.84-7.90(\mathrm{~m}, 3 \mathrm{H}), 7.66(\mathrm{~d}, J=$ $2.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.36(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.34(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H})$, $5.83-5.89(\mathrm{~m}, 1 \mathrm{H}), 5.65(\mathrm{bs}, 1 \mathrm{H}), 5.18(\mathrm{~d}, J=17.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.09(\mathrm{~d}, J=10.5 \mathrm{~Hz}, 1 \mathrm{H})$, $3.91(\mathrm{~s}, 3 \mathrm{H}), 3.47-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.35-3.41(\mathrm{~m}, 1 \mathrm{H}), 3.03-3.15(\mathrm{~m}, 4 \mathrm{H}), 2.41-2.43(\mathrm{~m}$, $1 \mathrm{H}), 1.40-1.73(\mathrm{~m}, 3 \mathrm{H}), 1.17-1.25(\mathrm{~m}, 3 \mathrm{H})$.

## 1-(3,5-Bis(trifluoromethyl)phenyl)-3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)thiourea C39 ${ }^{315}$

The title compound C39 was prepared from bis(trifluomethyl)phenyl isothiocyanate ( $1.5 \mathrm{~g}, 5.5 \mathrm{mmol}$ ) according to the general procedure . White solid, yield: 2.6 $\mathrm{g}, 4.4 \mathrm{mmol}, 88 \% . \mathrm{m} . \mathrm{p} .123-125{ }^{\circ} \mathrm{C}$. All data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 8.68(\mathrm{~d}, J=4.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.11$ (brs, 2 H ), $8.07(\mathrm{~d}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.95(\mathrm{~d}, J=9.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.59(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.55(\mathrm{~d}, J=4.7 \mathrm{~Hz}$, 1 H ), 7.44 (dd, $J=9.3,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.32$ (d, $J=11.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 5.84 (ddd, $J=17.2,10.5$, $6.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.02(\mathrm{dt}, J=10.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}),, 4.98(\mathrm{dt}, J=17.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.03(\mathrm{~s}, 3 \mathrm{H})$, 3.56-3.53 (m, 1H), 3.39-3.37 (m, 1H), 3.29 (dd, $J=13.6,9.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.82$ (ddd, $J=$ $15.6,13.8,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.79$ (ddd, $J=13.6,4.7,2.3 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.38-2.35 (m, 1H), 1.71$1.68(\mathrm{~m}, 2 \mathrm{H}), 1.64-1.61(\mathrm{~m}, 1 \mathrm{H}), 1.45(\mathrm{ddd}, J=13.3,10.4,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 0.89(\mathrm{dd}, J=$ $13.3,10.4 \mathrm{~Hz}, 1 \mathrm{H})$.

### 6.3.2. Squaramide-based Brønsted catalysts C4, C42, C43 and C60

### 6.3.2.1. Preparation of common squaric ester monoamide intermediate ${ }^{319}$

To a solution of 3,4-dimethoxy-3-cyclobutane-1,2-dione ( $1.42 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) in $\mathrm{MeOH}(20 \mathrm{~mL})$ was added 3,5-bis(trifluoromethyl)aniline ( $1.56 \mathrm{~mL}, 10.0 \mathrm{mmol}$ ). The reaction mixture was stirred at room temperature for 48 h . The formed precipitate was filtered and dried in vacuo to give the desired product ( $2.25 \mathrm{~g}, 6.6 \mathrm{mmol}, 66 \%$ ). m.p. 179$181{ }^{\circ} \mathrm{C}$. All spectroscopic data were identical to those reported in literature. ${ }^{1} \mathrm{H}$ NMR (300 MHz, DMSO- $d_{6}$ ) $\delta 11.18(\mathrm{~s}, 1 \mathrm{H}), 8.04(\mathrm{~s}, 2 \mathrm{H}), 7.78(\mathrm{~s}, 1 \mathrm{H}), 4.41(\mathrm{~s}, 3 \mathrm{H})$.

[^97]
### 6.3.2.2. Preparation of catalyst $\boldsymbol{C} \boldsymbol{4}^{319}$

To a solution of squaric ester monoamide prepared as above ( $339 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ) 9-amino-(9-deoxy)epiquinine ( $323 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), prepared following the procedure previously described, was added. The reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluent $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 98: 2$ ). White solid ( 441 mg , $0.70 \mathrm{mmol}, 70 \%$ yield); m.p. $224-225^{\circ} \mathrm{C}$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 9.88(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 8.80(\mathrm{~d}, J=$ $4.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.36(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 8.04-7.86(\mathrm{~m}, 3 \mathrm{H}), 7.76(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.67(\mathrm{~d}, J=$ $4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~s}, 1 \mathrm{H}), 7.47(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.19-5.73(\mathrm{~m}, 2 \mathrm{H}), 5.13-4.92(\mathrm{~m}$, 2 H ), $3.95(\mathrm{~s}, 3 \mathrm{H}), 3.52-3.42(\mathrm{~m}, 1 \mathrm{H}), 3.30-3.25(\mathrm{~m}, 1 \mathrm{H}) 2.77-2.58(\mathrm{~m}, 2 \mathrm{H}), 2.35-2.20$ $(\mathrm{m}, 1 \mathrm{H}), 1.60-1.47(\mathrm{~m}, 4 \mathrm{H}), 0.66(\mathrm{~m}, 1 \mathrm{H})$.

### 6.3.2.3. Preparation of catalyst C42

1st step: ${ }^{320}$ Glutaraldehyde ( $50 \mathrm{wt} \%$ in $\mathrm{H}_{2} \mathrm{O}, 1.90 \mathrm{~mL}, 10.4 \mathrm{mmol}$ ) was added dropwise into a mixture of diamine $(1.140 \mathrm{~g}, 10 \mathrm{mmol})$ and $\mathrm{NaBH}(\mathrm{OAc})_{3}(8.500 \mathrm{~g}, 40$ $\mathrm{mmol})$ in $\mathrm{ClCH}_{2} \mathrm{CH}_{2} \mathrm{Cl}(60 \mathrm{~mL})$ at room temperature. The resulting mixture was stirred at room temperature for 3 h , and quenched with NaOH aq solution ( $6 \mathrm{M}, 30 \mathrm{~mL}$ ). The organic layer was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic layers were concentrated. The residue was dissolved in 50 mL

[^98]$\mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed with brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated to give 1.622 g product as a yellow liquid ( $89 \%$ yield). All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.87-2.68(\mathrm{~m}, 1 \mathrm{H}), 2.67-$ $2.49(\mathrm{~m}, 3 \mathrm{H}), 2.41-2.19(\mathrm{~m}, 2 \mathrm{H}), 2.16-1.92(\mathrm{~m}, 2 \mathrm{H}), 1.88-1.34(\mathrm{~m}, 8 \mathrm{H}), 1.31-0.97$ (m, 4H).
$\mathbf{2}^{\text {nd }}$ step: $:^{321}$ To a solution of the squaric ester monoamide ( $339 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in 5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added 2-(piperidin-1-yl)cyclohexanamine ( $379 \mathrm{mg}, 1.0 \mathrm{mmol}$ ). The reaction mixture was stirred for 48 h at room temperature. After solvent evaporation the desired product was obtained by silica gel column chromatography (eluent $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : $\mathrm{MeOH}, 98: 2$ ). White solid ( $347 \mathrm{mg}, 0.71 \mathrm{mmol}, 71 \%$ yield). m.p. $134-136{ }^{\circ} \mathrm{C}$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.88(\mathrm{~s}, 2 \mathrm{H}), 7.43(\mathrm{~s}, 1 \mathrm{H}), 4.00-3.80(\mathrm{~m}, 1 \mathrm{H}), 2.66-2.49(\mathrm{~m}, 2 \mathrm{H}), 2.39$ $-2.14(\mathrm{~m}, 3 \mathrm{H}), 1.93-1.59(\mathrm{~m}, 4 \mathrm{H}), 1.48-0.98(\mathrm{~m}, 10 \mathrm{H})$.

### 6.3.2.4. Preparation of catalyst $\boldsymbol{C 4 3}$

$\mathbf{1}^{\text {st }}$ step: ${ }^{322} \mathrm{Na}_{2} \mathrm{CO}_{3}\left(2.12 \mathrm{~g}, 20 \mathrm{mmol}, 2\right.$ equiv.) and $\mathrm{Boc}_{2} \mathrm{O}(3.3 \mathrm{~g}, 15 \mathrm{mmol}, 1.5$ equiv.) were added to a solution of tert-leucine ( $1.31 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in water ( 20 $\mathrm{mL})$ and THF $(5 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. After stirring for 12 h at room temperature $\mathrm{HCl}(10 \%)$ was added until pH 2 and the mixture was extracted with $\mathrm{EtOAc}(3 \times 30 \mathrm{~mL})$. The aqueous phases were combined, washed with brine ( 50 mL ) and dried over $\mathrm{MgSO}_{4}$. After removing the solvent under reduced pressure, the resulting residue was redissolved in dry DMF ( 20 mL ) and DIPEA ( $2.58 \mathrm{~g}, 20 \mathrm{mmol}, 2$ equiv.) and HBTU ( $5.7 \mathrm{~g}, 15 \mathrm{mmol}, 1.5$

[^99]equiv.) were added. After stirring for 1 h piperidine ( $0.94 \mathrm{~g}, 11 \mathrm{mmol}, 1.1$ equiv.) was added and the mixture was stirred for further 16 h . The reaction was quenched adding $\mathrm{HCl} 1 \mathrm{M}(20 \mathrm{~mL})$ and the mixture was extracted with EtOAc ( 2 x 20 mL ). The organic phases were combined and washed with HCl 1 M and brine ( 20 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was then removed under reduced pressure and the resulting residue was purified by flash column chromatography on silica gel (eluting with hexane/ EtOAc $85 / 15$ ) to afford tert-butyl (S)-(3,3-dimethyl-1-oxo-1-(piperidin-1-yl)butan-2yl)carbamate as a white solid. Yield: $2.5 \mathrm{~g}, 8.3 \mathrm{mmol}, 83 \%$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 0.98(\mathrm{~s}, 9 \mathrm{H})$, $1.43(\mathrm{~s}, 9 \mathrm{H}), 1.52-1.62(\mathrm{~m}, 6 \mathrm{H}), 3.46-3.69(\mathrm{~m}, 4 \mathrm{H}), 4.54(\mathrm{~d}, J=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.38(\mathrm{~d}$, $J=9.6 \mathrm{~Hz}, 1 \mathrm{H})$.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{322}$ The previously obtained amide ( $2.5 \mathrm{~g}, 8 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ and trifluoroacetic acid ( 2 mL ) and stirred at 40 ${ }^{\circ} \mathrm{C}$ until no more starting material was observed by TLC (eluting with hexane/ EtOAc $70 / 30$ ). The solvent was then removed under reduced pressure and the residue was redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$. The solution was washed with $\mathrm{NaOH}(40 \%)$, dried over $\mathrm{MgSO}_{4}$ and the solvent was removed under reduced pressure to afford the aminoamide as a yellow oil. The aminoamide was then dissolved in dry diethyl ether ( 10 mL ) and was added dropwise over a suspension of lithium aluminiumhydride ( $879 \mathrm{mg}, 24 \mathrm{mmol}, 3$ equiv.) in diethyl ether ( 40 mL ) at $0{ }^{\circ} \mathrm{C}$ under nitrogen atmosphere. The mixture was stirred at the same temperature for some minutes and afterwards it was stirred at room temperature for 16 h . The reaction was quenched by the addition of water ( 5 mL ) and $\mathrm{NaOH} 15 \%(1,2 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The resulting mixture was filtered and the filtrate was extracted with diethyl ether ( $2 \times 10 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure. The residue was purified by flash column chromatography on silica gel (eluting with hexane/ EtOAc 1/1) to afford (S)-3,3-dimethyl-1-(piperidin-1-yl)butan-2-amine as yellow oil. Yield: $1.16 \mathrm{~g}, 6.8 \mathrm{mmol}$, $92 \%$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.66(\mathrm{dd}, J=11.0,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.52(\mathrm{~d}, J=12.3 \mathrm{~Hz}, 4 \mathrm{H}), 2.28$ (dd, $J=12.3,2.8 \mathrm{~Hz}, 3 \mathrm{H}), 2.13(\mathrm{dd}, J=12.1,11.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.61-1.53(\mathrm{~m}, 4 \mathrm{H}), 1.44-1.42$ (m, 2H), $0.90(\mathrm{~s}, 9 \mathrm{H})$.
$\mathbf{3}^{\text {rd }}$ step: ${ }^{323}$ To a solution of the diamine ( $780 \mathrm{mg}, 4.6 \mathrm{mmol}, 1$ equiv.) in methanol $(30 \mathrm{~mL})$ the squaric ester monoamide obtained above ( $1.56 \mathrm{~g}, 4.6 \mathrm{mmol}, 1$ equiv.) was added and the mixture was stirred until complete disappearance of the starting amide as monitored by TLC ( 16 h ). The formed white precipitate was filtered and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford essentially pure $\mathbf{C 4 3}$ as a white solid. m.p. $246-248{ }^{\circ} \mathrm{C}$. Yield: 1.29 g ,

[^100]$2.6 \mathrm{mmol}, 59 \%$. All spectroscopic data were identical to those reported in the literature.
${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 10.09(\mathrm{~s}, 1 \mathrm{H}), 8.08(\mathrm{~s}, 2 \mathrm{H}), 7.64(\mathrm{~s}, 1 \mathrm{H}), 4.07-3.93(\mathrm{~m}$, $1 \mathrm{H}), 2.49-2.04(\mathrm{~m}, 5 \mathrm{H}), 1.51-1.22(\mathrm{~m}, 6 \mathrm{H}), 0.93(\mathrm{~s}, 9 \mathrm{H})$.

### 6.3.2.5. Preparation of catalyst C60

$N$-(3,5-bis(trifluoromethyl)phenyl)-3-nitro-5-(trifluoromethyl)benzamide ${ }^{324}$

1-Methylimidazole ( $1.99 \mathrm{~mL}, 25 \mathrm{mmol}, 2.5$ equiv.) was added to a slurry of the 3-nitro-5-(trifluoromethyl)benzoic acid ( $2.351 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{CL}_{2}(25 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$, and the mixture was stirred for $10 \mathrm{~min} . \mathrm{MsCl}(1.16 \mathrm{~mL}, 15 \mathrm{mmol}, 1.5$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added to the mixture under $-5{ }^{\circ} \mathrm{C}$. After the resulting mixture was stirred under that temperature for 20 min and then $3,5-\mathrm{bis}($ trifluoromethyl)aniline ( 1.56 $\mathrm{mL}, 10 \mathrm{mmol}, 1$ equiv.) was added. The mixture was stirred at room temperature for 2 h . $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ was then added and a solid precipitated, which was solved in EtOAc (100

[^101]mL ). The organic layer was washed with brine ( $3 \times 50 \mathrm{~mL}$ ) and dried over anhydrous $\mathrm{MgSO}_{4}$. The solvent was evaporated under reduced pressure and the crude was crushed with diethyl ether to afford the title product as a white solid. Yield: $4.5 \mathrm{~g}, 10 \mathrm{mmol}$, $>99 \%{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 9.10(\mathrm{~s}, 1 \mathrm{H}), 8.72(\mathrm{~s}, 2 \mathrm{H}), 8.43(\mathrm{~s}, 2 \mathrm{H}), 7.72(\mathrm{~s}$, 1H). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 164.9,150.3,141.9,138.7,134.3$ (q), 133.3 (q), 131.6, 131.5, 127.5, 124.8, 124.7, 121.7, 121.6, 118.7. ### 6.3.3. Ureidopeptide-like Brønsted base catalyst C59

6.3.3.1. Preparation of the N-((benzyloxy)carbonyl)-L-tert-leucine ${ }^{327}$

To a stirred solution of the benzyl alcohol ( 1 equiv., 10 mmol ) in dichloromethane $(50 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added pyridine ( 1.15 equiv., $0.92 \mathrm{~mL}, 11.5 \mathrm{mmol}$ ) followed by triphosgene ( 0.4 equiv., $1.2 \mathrm{~g}, 4 \mathrm{mmol}$ ). The resulting mixture was stirred at room temperature overnight, and then it was partially evaporated at reduced pressure and diluted with hexane ( 50 mL ). The solids were removed by filtration and the filtrate was evaporated to afford the corresponding chloroformate in quantitative yield, which was used as such for the next step without further purification.

To a stirred solution of the L-tert-leucine ( $1.31 \mathrm{~g}, 10 \mathrm{mmol}$ ) in $10 \%$ aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}(26 \mathrm{~mL})$, and dioxane ( 10 mL ) was slowly added at $0{ }^{\circ} \mathrm{C}$ a solution of the previous chloroformate $(1.4 \mathrm{~mL}, 10 \mathrm{mmol})$ in dioxane $(30 \mathrm{~mL})$. The mixture was stirred

[^104]at the same temperature for 1 h and then allowed to warm to room temperature. The solution was subsequently stirred overnight, poured into $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The aqueous layer was cooled in an ice bath and acidified with concentrated HCl , followed by extraction with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined extracts were dried over $\mathrm{MgSO}_{4}$, filtered off and the solvent evaporated under reduced pressure to afford the title compound. White solid, yield: $2.5 \mathrm{~g}, 9.3 \mathrm{mmol}, 93 \%$. All data were consistent with those previously reported. ${ }^{328}{ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO), $\delta: 7.50-$ $7.40(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.15(\mathrm{~m}, 3 \mathrm{H}), 4.20(\mathrm{~d}, J=13.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.95(\mathrm{~d}, J=16.8 \mathrm{~Hz}, 1 \mathrm{H})$, 3.18 ( $\mathrm{s}, 1 \mathrm{H}$ ), 0.94 (s, 9H).

### 6.3.3.2. Preparation of $N$-Cbz-L-tert-leucine derived isocyanate and coupling with 9-amino-(9-deoxy)epiquinine ${ }^{329}$

## Benzyl ((S)-1-(3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)ureido)-2,2-dimethylpropyl)carbamate C59

To a cooled solution of the N -Cbz- $L$-tert-leucine (1.3 g, 5 mmol , 1 equiv.) in dry THF ( 20 mL ) were added isobutyl chloroformate ( 1 equiv., $0.65 \mathrm{~mL}, 5 \mathrm{mmol}$ ), and $N$-methylmorpholine ( 1 equiv., $0.6 \mathrm{~mL}, 5 \mathrm{mmol}$ ) and the mixture was stirred at $-20^{\circ} \mathrm{C}$ for 20 min . Then, a suspension of $\mathrm{NaN}_{3}$ ( 1.5 equiv., 0.48 g in 5 mL of $\mathrm{H}_{2} \mathrm{O}, 7.5 \mathrm{mmol}$ ) was added and the reaction mixture was stirred at the same temperature. After 30 min , the organic layer was separated, evaporated and the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$, and washed with water ( 15 mL ). The organic phase was dried over $\mathrm{MgSO}_{4}$, and concentrated under vacuum to give a yellow oil which was redissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$. The resulting solution was heated at $40^{\circ} \mathrm{C}$ under nitrogen for $1-2 \mathrm{~h}$. The reaction was monitored by IR analysis until disappearance of the isocyanate band. After completion, the amine was added ( 0.7 equiv., 3.5 mmol ) and the reaction mixture was stirred overnight at room temperature. The solvent was evaporated and the residue was purified by flash column chromatography on silica gel (eluting with dichloromethane $\rightarrow$ dichloromethane/ methanol 80/20 ) to afford the desired catalyst C59. White solid, yield: $1.48 \mathrm{~g}, 2.5 \mathrm{mmol}$, $72 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-29.8\left(\mathrm{c}=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right), \delta: 8.62(\mathrm{~d}, J=4.3$, $1 \mathrm{H}), 8.01(\mathrm{~d}, J=9.2,1 \mathrm{H}), 7.74(\mathrm{~d}, J=2.6,1 \mathrm{H}), 7.39(\mathrm{~d}, J=2.7,1 \mathrm{H}), 7.37-7.34(\mathrm{~m}, 5 \mathrm{H})$, $7.22(\mathrm{~d}, J=4.4,1 \mathrm{H}), 6.48-6.35(\mathrm{bs}, 1 \mathrm{H}), 5.84-5.73(\mathrm{~m}, 1 \mathrm{H}), 5.32-5.29(\mathrm{~m}, 1 \mathrm{H}), 5.20(\mathrm{~d}$,

### 6.4. EXPERIMENTAL SECTION OF CHAPTER 2

### 6.4.1. Preparation of pronucleophiles

6.4.1.1. Synthesis of cyanoacetates $\mathbf{4 4} \boldsymbol{a}-\boldsymbol{h}^{330}$

A solution of the corresponding nitrile ( 10 mmol ) in THF ( 10 mL ) was added dropwise to a solution of LDA ( $25 \mathrm{mmol}, 2.5$ equiv.) in THF ( 30 mL ) cooled to $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 45 min . and then at room temperature for an additional 45 minutes. Then it was cooled to $-78^{\circ} \mathrm{C}$ and a solution of di-tert-butyl dicarbonate ( $2.62 \mathrm{~g}, 12 \mathrm{mmol}, 1.2$ equiv.) in THF ( 10 mL ) was added dropwise via syringe. After stirring at $-78{ }^{\circ} \mathrm{C}$ for 16 hours, the mixture was quenched with saturated ammonium chloride ( 20 mL ) and extracted with diethyl ether ( $3 \times 50 \mathrm{~mL}$ ). The organic layer was washed with $1 \mathrm{~N} \mathrm{HCl}(30 \mathrm{~mL})$, brine ( 30 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure and the resulting crude oil was purified by silica gel flash chromatography (EtOAc:hexane 1:20) to yield the desired cyanoester 44.

## tert-Butyl 2-cyano-2-phenylacetate $44 a^{330}$

It was obtained as a clear oil ( $1.402 \mathrm{~g}, 6.4 \mathrm{mmol}, 64 \%$ ) from benzyl cyanide ( $1.15 \mathrm{~mL}, 10 \mathrm{mmol}$ ) and the characterization data were coincident with the reported ones. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.42(\mathrm{~m}, 5 \mathrm{H}), 4.61$ $(\mathrm{s}, 1 \mathrm{H}), 1.45(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 164.0,130.7,129.4,129.1,127.9$, 116.14, 84.6, 45.0, 27.8. HRMS (ESI): $\mathrm{C}_{13} \mathrm{H}_{16} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 218.1181, found: 218.1196.

[^106]
## tert-Butyl 2-cyano-2-(p-tolyl)acetate 44b ${ }^{331}$

It was obtained as a clear oil ( $1.734 \mathrm{~g}, 7.5 \mathrm{mmol}, 75 \%$ ) from 4methylbenzyl cyanide ( $1.33 \mathrm{~mL}, 10 \mathrm{mmol}$ ) and the characterization data were coincident with the reported ones. ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.32(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.21(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.56(\mathrm{~s}$, $1 \mathrm{H}), 2.36(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 164.3,139.1,130.1,127.8$, 116.3, 84.5, 44.6, 27.8, 21.3. HRMS (ESI): $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 232.1338, found: 232.1330 .

## tert-Butyl 2-cyano-2-(4-methoxyphenyl)acetate 44c

It was obtained as a clear oil ( $1.826 \mathrm{~g}, 7.4 \mathrm{mmol}, 74 \%$ ) from 4methoxybenzyl cyanide ( $1.31 \mathrm{~mL}, 10 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 7.44-7.30(\mathrm{~m}, 2 \mathrm{H}), 6.99-6.85(\mathrm{~m}, 2 \mathrm{H}), 4.55(\mathrm{~s}, 1 \mathrm{H})$, $3.82(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 164.4$, 160.2, 129.2, 122.6, 116.4, 114.8, 84.5, 55.5, 44.2, 27.8. HRMS (ESI): $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NO}_{3}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 248.1287, found: 248.1282.
tert-Butyl 2-cyano-2-(4-bromophenyl)acetate 44d ${ }^{330}$

6.4.1.2. Synthesis of racemic azlactones $81-87^{332}$

Azlactones were prepared from the corresponding acyl chloride as shown above. When the acyl chloride was not commercial it was prepared according to the following procedure:

[^108]$\mathbf{1}^{\text {st }}$ step: Synthesis of the acyl chloride. To a suspension of the carboxylic acid (1 eq.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL} / \mathrm{mmol})$ thionyl chloride ( 10 eq .) was added and the mixture was refluxed for 1 h . All volatiles were evaporated under reduced pressure to afford the acyl chloride which was used without further purification.
$\mathbf{2}^{\text {nd }}$ step: Synthesis of the N -substituted amino acid. The corresponding racemic amino acid (1 equiv.) and NaOH ( $4 \mathrm{eq}$. .) were dissolved in $\mathrm{H}_{2} \mathrm{O} / \mathrm{CH}_{3} \mathrm{CN}(75 / 25,0.3 \mathrm{M}$ ). After cooling to $0{ }^{\circ} \mathrm{C}$, the corresponding acyl chloride ( 1.05 equiv.) was added dropwise at this temperature. After the addition was complete, the mixture was stirred for additional 2 h at $0{ }^{\circ} \mathrm{C}$. Subsequently, the mixture was allowed to warm to room temperature and was stirred for one additional hour. All volatiles were then removed under reduced pressure before conc. HCl was added to cause precipitation. The mixture was filtered and the filter cake was washed with ice-cold diethyl ether.

## ( $\pm$ ) $N$-Benzoyl-D,L-leucine ${ }^{333}$

## ( $\pm$ ) 2-(tert-Butyl)-4-isobutyloxazol-5(4H)-one $87^{340}$

The title compound was prepared from 4-methyl-2-pivalamidopentanoic acid ( $1.08 \mathrm{~g}, 5 \mathrm{mmol}$ ) according to the general procedure. Colourless oil; yield: $828 \mathrm{mg}, 4.21 \mathrm{mmol}, 84 \%$. The characterization data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.17(\mathrm{dd}, J=8.0,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.95(\mathrm{dp}, J=13.4,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.74$ (ddd, $J=13.5,7.2,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.57(\mathrm{ddd}, J=13.8,8.1,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.28(\mathrm{~s}, 9 \mathrm{H}), 0.97$ $(\mathrm{t}, J=6.5 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 179.6,171.5,63.4,40.5,27.5,26.8$, 25.0, 22.6, 22.4. UPLC-DAD-QTOF: $\mathrm{C}_{11} \mathrm{H}_{20} \mathrm{NO}_{2}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 198.1494, found: 198.1490 .

[^113]
### 6.4.2. Conjugate addition of $\alpha$-cyanoacetates to $\beta$-substituted $\alpha$ '-hydroxy enones

6.4.2.1. Asymmetric reaction

To a mixture of the corresponding cyanoacetate 44 ( $0.1 \mathrm{mmol}, 1$ equiv.) and $\alpha^{\prime}$ 'hydroxy enone $\mathbf{6 0}$ ( $0.3 \mathrm{mmol}, 3$ equiv.) in 1,2-dichloroethane (DCE, 0.4 mL ), catalyst $\mathbf{C 4}$ $(6.31 \mathrm{mg}, 0.01 \mathrm{mmol})$ was added. The resulting mixture was stirred at $40{ }^{\circ} \mathrm{C}$, unless otherwise stated, until consumption of the cyanoacetate (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction was treated with HCl 1 N , the product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic phases were dried over $\mathrm{MgSO}_{4}$. Evaporation of the solvent under reduced pressure gave the crude product as a mixture of diastereomers in all cases higher than 95:5. After purification by flash column chromatography (eluent hexane/ ethyl acetate $95 / 5$ ) the product was isolated in essentially diastereomerically pure form.

### 6.4.2.2. Racemic reaction

Racemic reactions were conducted following the procedure for the asymmetric version, but using as catalyst $\mathrm{DBU}(20 \mathrm{~mol} \%)$ and running the reaction at $70^{\circ} \mathrm{C}$.

### 6.4.2.3. Characterization data for compounds $\mathbf{6 4}$

## (2S,3S)-tert-Butyl 2-cyano-6-hydroxy-6-methyl-5-oxo-3-phenethyl-2phenylheptanoate 64Aa

The title compound was prepared from ( $E$ )-2-hydroxy-2-methyl-7-phenylhept-4-en-3-one 60A ( $65 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) and tert-butyl 2-cyano-2-phenylacetate 44 a ( $22 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) according to the general procedure. The diastereomeric ratio was determined in the crude material (98:2). Yield of pure major diastereomer after column chromatography purification (colourless oil): $90 \%(39 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{25}=+44.8^{\circ}\left(\mathrm{c}=1.00,96 \% \mathrm{ee}, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$

NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.56-7.54(\mathrm{~m}, 2 \mathrm{H}), 7.42-7.36(\mathrm{~m}, 3 \mathrm{H}), 7.20-7.10(\mathrm{~m}$, $3 \mathrm{H}), 6.92-6.90(\mathrm{~m}, 2 \mathrm{H}), 3.60(\mathrm{brs}, 1 \mathrm{H}), 3.40-3.35(\mathrm{~m}, 1 \mathrm{H}), 2.95(\mathrm{dd}, J=18.8 \mathrm{~Hz}$ and $7.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.83(\mathrm{dd}, J=18.8 \mathrm{~Hz}$ and $2.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.45-2.38(\mathrm{~m}, 1 \mathrm{H}), 2.21-2.12(\mathrm{~m}$, $1 \mathrm{H}), 1.60-1.46(\mathrm{~m}, 2 \mathrm{H}), 1.43(\mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~s}, 3 \mathrm{H}), 1.37(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 211.6,166.0,141.12,133.4,129.1,129.0,128.3,128.1,126.4,125.9,117.7$, 84.7, 76.4, 60.7, 39.5, 39.2, 33.7, 33.4, 27.4, 26.8, 26.7. MS (ESI, $m / z$ ): calcd for $\mathrm{C}_{27} \mathrm{H}_{34} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 436.2488$; found, 436.2485 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-3, hexane/isopropanol 90/10, flow rate $=0.5$ $\mathrm{mL} / \mathrm{min}$ at $10^{\circ} \mathrm{C}$, retention times: 23.5 min (minor.) and 24.7 min (major.)).

## (2S,3S)-tert-Butyl 2-cyano-6-hydroxy-6-methyl-5-oxo-3-phenethyl-2-(p-tolyl) heptanoate 64Ab

The title compound was prepared from tert-butyl 2-cyano-2( $p$-tolyl)acetate 44 b ( $23 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and ( $E$ )-2-hydroxy-2-methyl-7-phenylhept-4-en-3-one 60A ( $65 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The diastereomeric ratio was determined in the crude material (99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): $95 \%(43 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{24}=+40.0^{\circ}$ ( $\mathrm{c}=1.9,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.55-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.22-7.07$ $(\mathrm{m}, 5 \mathrm{H}), 7.02-6.80(\mathrm{~m}, 2 \mathrm{H}), 3.59(\mathrm{~s}, 1 \mathrm{H}), 3.40-3.28(\mathrm{~m}, 1 \mathrm{H}), 2.92(\mathrm{dd}, J=18.6,7.6$ $\mathrm{Hz}, 1 \mathrm{H}), 2.79(\mathrm{dd}, J=18.6,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.53-2.39(\mathrm{~m}, 1 \mathrm{H}), 2.19(\mathrm{~m}, 1 \mathrm{H}), 1.59(\mathrm{~m}, 1 \mathrm{H})$, $1.53-1.45(\mathrm{~m}, 1 \mathrm{H}) 1.42(\mathrm{~s}, 3 \mathrm{H}), 1.40(\mathrm{~s}, 3 \mathrm{H}), 1.37(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 211.9, 166.4, 141.4, 139.1, 130.6, 123.0, 128.5, 128.4, 126.5, 126.1, 118.0, 84.8, 76.6, $60.6,39.8,39.4,33.9$, 33.7, 27.7, 27.0, 26.9, 21.2. UPLC-DAD-QTOF: $\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{NO}_{4}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 450.2344 , found: 450.2347. The enantiomeric purity of the major diastereomer was determined by HPLC analysis (Daicel Chiralcel AD-H, hexane/isopropanol 98/2, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 49.9 min (minor.) and 57.5 min (major.)). Channel Descr.: PDA 210 nm.

## (2S,3S)-tert-Butyl 2-cyano-6-hydroxy-2-(4-methoxyphenyl)-6-methyl-5-oxo-3phenethylheptanoate 64Ac

The title compound was prepared from tert-butyl 2-cyano-2-(4-methoxyphenyl)acetate $\mathbf{4 4 c}(25 \mathrm{mg}, 0.1 \mathrm{mmol})$ and ( $E$ )-2-hydroxy-2-methyl-7-phenylhept-4-en-3-one $\mathbf{6 0 A}(65 \mathrm{mg}, 0.3$ mmol ) according to the general procedure. The diastereomeric ratio was determined in the crude material (98:2). Yield of pure major diastereomer after column chromatography purification (colourless oil): $92 \%$ ( 43 mg ). $[\alpha]_{\mathrm{D}}{ }^{24}=+37.0^{\circ}\left(\mathrm{c}=1.4,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.57-7.36(\mathrm{~m}$,

UPLC-DAD-QTOF: $\mathrm{C}_{22} \mathrm{H}_{32} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 374.2331 , found: 374.2339 . The enantiomeric purity of the major diastereomer was determined by HPLC analysis (Daicel Chiralcel AD-H, hexane/isopropanol 98/2, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 22.2 min (major.) and 29.7 min (minor.)).

## (2S,3S)-tert-Butyl 2-cyano-3-(3-hydroxy-3-methyl-2-oxobutyl)-2-phenylhept-6enoate 64Da

The title compound was prepared from tert-butyl 2-cyano-2phenylacetate 44 a ( $22 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and ( $E$ )-2-hydroxy-2-methylnona-4,8-dien-3-one 60D ( $50 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The diastereomeric ratio was determined in the crude material (99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): Yield: $93 \%(36 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{23}=+29.4^{\circ}(\mathrm{c}=1.7,96 \% e e$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.58(\mathrm{~m}, 2 \mathrm{H}), 7.51-7.34(\mathrm{~m}, 3 \mathrm{H}), 5.62-5.49$ $(\mathrm{m}, 1 \mathrm{H}), 4.93-4.77(\mathrm{~m}, 1 \mathrm{H}), 3.58(\mathrm{~s}, 1 \mathrm{H}), 3.39-3.26(\mathrm{~m}, 1 \mathrm{H}), 2.94-2.73(\mathrm{~m}, 2 \mathrm{H}), 1.84$ $-1.61(\mathrm{~m}, 2 \mathrm{H}), 1.42(\mathrm{~s}, 3 \mathrm{H}), 1.38(\mathrm{~s}, 3 \mathrm{H}), 1.37(\mathrm{~s}, 9 \mathrm{H}), 1.33-1.23(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.7,166.2,137.5,133.7,129.3,129.2,127.1,126.6,117.9,115.4$, 85.0, 76.6, 61.0, 39.6, 39.0, 31.3, 31.2, 27.7, 27.0, 27.0. UPLC-DAD-QTOF: $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{NO}_{4}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 386.2331, found: 386.2320 . The enantiomeric purity of the major diastereomer was determined by HPLC analysis (Daicel Chiralcel AD-3, hexane/isopropanol $95 / 5$, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 19.4 min (major.) and 21.9 min (minor.)). Channel Descr.: PDA 207 nm.

## (2S,3S)-tert-Butyl 2-cyano-6-hydroxy-3-isobutyl-6-methyl-5-oxo-2-phenylheptanoate 64Ea

The title compound was prepared from tert-butyl 2-cyano-2phenylacetate 44 a ( $22 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and ( $E$ )-2-hydroxy-2,7-dimethyloct-4-en-3-one $\mathbf{6 0 E}(51 \mathrm{mg}, 0.3 \mathrm{mmol})$ according to the general procedure. The diastereomeric ratio was determined in the crude material (95:5). Yield of pure major diastereomer after column chromatography purification (colourless oil): $82 \%(32 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{23}=+32.6^{\circ}\left(\mathrm{c}=1.2,83 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.57(\mathrm{~m}, 2 \mathrm{H}), 7.46-7.35(\mathrm{~m}, 3 \mathrm{H}), 3.62(\mathrm{~s}, 1 \mathrm{H}), 3.41(\mathrm{~m}$, $1 \mathrm{H}), 2.81-2.74(\mathrm{~m}, 2 \mathrm{H}), 1.41(\mathrm{~s}, 3 \mathrm{H}), 1.37(\mathrm{~s}, 3 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}), 1.23-1.18(\mathrm{~m}, 1 \mathrm{H})$, $1.10(\mathrm{~m}, 1 \mathrm{H}), 0.96(\mathrm{~m}, 1 \mathrm{H}), 0.74(\mathrm{t}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.7$, $166.4,134.0,129.2,129.1,126.7,84.9,76.5,61.5,41.8,40.3,37.4,27.7,27.0,27.0,25.4$,
24.0, 21.4. UPLC-DAD-QTOF: $\mathrm{C}_{23} \mathrm{H}_{34} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 388.2488 , found: 388.2491 . The enantiomeric purity of the major diastereomer was determined by HPLC analysis (Phenomenex Lux $3 \mu$ Cellulose-2, hexane/isopropanol 98/2, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 10.3 min (minor.) and 12.7 min (major.)). Channel Descr.: PDA 207 nm.

### 6.4.2.4. Elaboration of adducts $\mathbf{6 7}, 71$ and $\mathbf{7 2}$

6.4.2.4.1. To carboxylic acids $\mathbf{6 7}$

A suspension of sodium periodate $\mathrm{NaIO}_{4}(342 \mathrm{mg}, 1.6 \mathrm{mmol})$ in water $(0.8 \mathrm{~mL})$ was added to a solution of the corresponding $\alpha^{\prime}$-hydroxy ketone adduct $\mathbf{6 4}(0.2 \mathrm{mmol})$ in methanol ( 1 mL ). The mixture was stirred at room temperature until the reaction was complete (monitored by TCL, 48 h ). Then the solvent was removed under reduced pressure. Water ( 4.5 mL ) was added to the residue and the resulting mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $3 \times 6 \mathrm{~mL}$ ). The combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure to afford the corresponding carboxylic acid 67.

## (3S,4S)-5-(tert-Butoxy)-4-cyano-5-oxo-3-phenethyl-4-phenylpentanoic acid 67Aa

The title compound was prepared from ( $2 S, 3 S$ )-tert-butyl 2-cyano-6-hydroxy-6-methyl-5-oxo-3-phenethyl-2-phenylheptanoate 64Aa (87 $\mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 80/20) to give the title compound as a white foam. Yield: 57 $\mathrm{mg}, 0.14 \mathrm{mmol}, 72 \% .[\alpha]_{\mathrm{D}}{ }^{23}=+24.1^{\circ}\left(\mathrm{c}=0.4, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.53(\mathrm{~m}, 2 \mathrm{H}), 7.44-7.31(\mathrm{~m}, 3 \mathrm{H}), 7.16(\mathrm{~m}, 3 \mathrm{H}), 6.99-6.86(\mathrm{~m}, 2 \mathrm{H}), 3.17(\mathrm{dq}, J=10.1$, $5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.75-2.69(\mathrm{~m}, 2 \mathrm{H}), 2.61(\mathrm{ddd}, J=13.8,10.3,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.31(\mathrm{ddd}, J=$ $13.7,10.1,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.67-1.51(\mathrm{~m}, 2 \mathrm{H}), 1.40(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 178.1, 166.1, 141.1, 133.5, 129.3, 129.2, 128.5, 128.5, 126.6, 126.2, 117.5, 85.1, 60.7, 41.0, 37.9, 33.5, 33.4, 27.7 UPLC-DAD-QTOF: $\mathrm{C}_{24} \mathrm{H}_{28} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 394.2018, found: 394.2022.
(3S,4S)-5-(tert-Butoxy)-4-cyano-4-(4-methoxyphenyl)-5-oxo-3-phenethylpentanoic acid 67Ac

The title compound was prepared from ( $2 S, 3 S$ )-tert-butyl 2-cyano-6-hydroxy-2-(4-methoxyphenyl)-6-methyl-5-oxo-3phenethylheptanoate 64Ac ( $93 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 48 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 80/20) to give the title compound as a white foam. Yield: $68 \mathrm{mg}, 0.16 \mathrm{mmol}, 80 \% .[\alpha]_{\mathrm{D}}{ }^{24}=+26.8^{\circ}(\mathrm{c}=1.05$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.45-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.17(\mathrm{~m}, 3 \mathrm{H}), 6.98-6.83$ (m, 4H), $3.82(\mathrm{~s}, 3 \mathrm{H}), 3.15-3.04(\mathrm{~m}, 1 \mathrm{H}), 2.71-2.65(\mathrm{~m}, 2 \mathrm{H}), 2.64-2.54(\mathrm{~m}, 1 \mathrm{H}), 2.32$ (ddd, $J=13.7,9.5,7.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.64-1.53(\mathrm{~m}, 2 \mathrm{H}), 1.39(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 177.2,166.1,159.9,141.0,128.3,127.7,125.9,125.1,117.4,114.4,84.8,59.8$, 55.3, 40.8, 37.5, 33.2, 27.5. UPLC-DAD-QTOF: $\mathrm{C}_{25} \mathrm{H}_{30} \mathrm{NO}_{5}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 424.2124, found: 424.2122.
(3S,4S)-4-(4-Bromophenyl)-5-(tert-butoxy)-4-cyano-5-oxo-3-phenethylpentanoic acid 67Ad
 The title compound was prepared from $(2 R, 3 S)$-tert-butyl 2-(4-bromophenyl)-6-hydroxy-2-isocyano-6-methyl-5-oxo-3-phenethyl-heptanoate 64Ad ( $103 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 48 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 80/20) to give the title compound as a white foam. Yield: $66 \mathrm{mg}, 0.14 \mathrm{mmol}, 70 \% .[\alpha]_{\mathrm{D}}{ }^{24}=+30.1^{\circ}(\mathrm{c}=0.6$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.49(\mathrm{~m}, 2 \mathrm{H}), 7.37(\mathrm{~m}, 2 \mathrm{H}), 7.26-7.12(\mathrm{~m}, 3 \mathrm{H})$, $7.00-6.90(\mathrm{~m}, 2 \mathrm{H}), 3.12(\mathrm{dq}, J=9.1,6.1,5.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.76-2.67(\mathrm{~m}, 2 \mathrm{H}), 2.68-2.56$ $(\mathrm{m}, 1 \mathrm{H}), 2.36$ (ddd, $J=13.7,9.7,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.65(\mathrm{dq}, J=13.4,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.56-1.46$ $(\mathrm{m}, 1 \mathrm{H}), 1.40(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 177.9,165.7,140.8,132.6,132.4$, 128.6, 128.5, 128.3, 126.3, 123.5, 117.0, 85.5, 60.3, 40.9, 37.7, 33.4, 33.2, 27.6. UPLC-DAD-QTOF: $\mathrm{C}_{24} \mathrm{H}_{27} \mathrm{NO}_{4} \mathrm{Br}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 472.1123, found: 472.1126.
6.4.2.4.2. To ketones 71-72

## (2S,3S)-tert-Butyl 2-cyano-5-oxo-2-phenyl-3-propylhexanoate 71

$\mathrm{MeMgBr}(3.2 \mathrm{M}$ in MeTHF, $0.67 \mathrm{~mL}, 2.15 \mathrm{mmol}$ ) was added to a solution of the $\alpha^{\prime}$-hydroxy ketone 64Ca ( $159 \mathrm{mg}, 0.43 \mathrm{mmol}$ ) in dry THF ( 1.5 mL ) at $0^{\circ} \mathrm{C}$ and the resulting solution was stirred at room temperature until the reaction was finished (monitored by TLC). Then $\mathrm{NH}_{4} \mathrm{Cl}$ (saturated solution, 3 mL ) was added at $0{ }^{\circ} \mathrm{C}$ and the resulting mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 5 \mathrm{~mL}$ ). The solvents were removed under reduced pressure and the residue thus obtained was subjected to oxidative scission by treatment with $\mathrm{NaIO}_{4}$, under the same conditions reported above. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $25 / 1$ to $10 / 1)$ to afford an oil. Yield: $90 \mathrm{mg}, 0.27 \mathrm{mmol}, 64 \% .[\alpha]_{\mathrm{D}}{ }^{23}=+35.4^{\circ}\left(\mathrm{c}=0.85, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.70-7.47(\mathrm{~m}, 2 \mathrm{H}), 7.37(\mathrm{~m}, 3 \mathrm{H}), 3.33-3.12(\mathrm{~m}, 1 \mathrm{H})$, 2.68 (dd, $J=17.8,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.58(\mathrm{dd}, J=17.8,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.17(\mathrm{~s}, 3 \mathrm{H}), 1.35(\mathrm{~s}, 9 \mathrm{H})$, $1.12(\mathrm{~m}, 3 \mathrm{H}), 1.00-0.87(\mathrm{~m}, 1 \mathrm{H}), 0.68(\mathrm{t}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 205.5, 166.3, 133.9, 129.1, 128.9, 126.6, 117.9, 84.6, 61.2, 47.1, 39.4, 33.9, 30.3, 27.6, 20.3, 14.2. UPLC-DAD-QTOF: $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{NO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 330.2069, found: 330.2072.

## Determination of the stereochemistry. Conversion of tert-butyl ester 71 into methyl ester 72

A solution of tert-butyl ester $71(70 \mathrm{mg}, 0.21 \mathrm{mmol})$ in trifluoroacetic
 acid ( 1.0 mL ) was stirred for 1 h at room temperature. After evaporating all volatile compounds, the corresponding carboxylic acid was obtained and the residue was dissolved in $\mathrm{MeOH}(1 \mathrm{~mL})$. Trimethylsilyldiazomethane ( 2 M in diethyl ether, 0.8 mL ) was added and the reaction mixture was stirred for 30 min at room temperature. Then all volatile compounds were evaporated and the crude material was purified by flash column chromatography (eluting with hexane/ethyl acetate 95:5) to afford the desired methyl ester. Yield: $43 \mathrm{mg}, 0.15$ mmol, $71 \% .[\alpha]_{\mathrm{D}}{ }^{23}=+45.0^{\circ}\left(\mathrm{c}=0.85, \mathrm{CHCl}_{3}\right)$. Literature data for the opposite enantiomer $(2 S, 3 R):[\alpha]_{\mathrm{D}}{ }^{25}=-53^{\circ}\left(\mathrm{c}=0.85, \mathrm{CHCl}_{3}\right) .{ }^{341}$ Spectroscopic data were essentially identical to those reported: ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.60(\mathrm{~m}, 2 \mathrm{H}), 7.41(\mathrm{qd}, J=6.3,5.8,2.4 \mathrm{~Hz}$, 3 H ), 3.73 (s, 3H), $3.32-3.22(\mathrm{~m}, 1 \mathrm{H}), 2.70(\mathrm{dd}, J=17.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.61$ (dd, $J=17.7$, $3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.19(\mathrm{~s}, 3 \mathrm{H}), 1.15(\mathrm{~m}, 3 \mathrm{H}), 1.03-0.96(\mathrm{~m}, 1 \mathrm{H}), 0.71(\mathrm{t}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 205.5,168.2,133.4,129.4,129.3,126.9,117.6,60.1,54.1$, 47.0, 40.0, 33.7, 30.3, 20.4, 14.2. UPLC-DAD-QTOF: $\mathrm{C}_{17} \mathrm{H}_{22} \mathrm{NO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 288.1600, found: 288.1605 .

[^114]
### 6.4.3. Conjugate addition of $\alpha$-cyanoacetates to $\alpha$-methyl $\alpha$ '-hydroxy enone 61

### 6.4.3.1. Asymmetric reaction

To a mixture of the corresponding cyanoacetate 44 ( $0.3 \mathrm{mmol}, 1.5$ equiv.) and $\alpha^{\prime}$ 'hydroxy enone 61 ( 0.2 mmol, 1 equiv.) in 1,2-dichloroethane (DCE, 0.4 mL ), catalyst $\mathbf{C 4}$ $(13 \mathrm{mg}, 0.02 \mathrm{mmol})$ was added. The resulting mixture was stirred until consumption of the enone (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The mixture was treated with HCl 1 N , the product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic phases were dried over $\mathrm{MgSO}_{4}$. Evaporation of the solvent under reduced pressure gave the crude product as a mixture of diastereomers in all cases higher than 98:2. After purification by flash column chromatography (eluent hexane/ethyl acetate 95/5) the product was isolated in essentially diastereomerically pure form.

### 6.4.3.2. Racemic reaction

Racemic reactions were conducted following the procedure for the asymmetric version, but using as catalyst DBU ( $20 \mathrm{~mol} \%$ ) and running the reaction at room temperature.

### 6.4.3.3. Characterization data for compounds 79a-f

## (2S,4S)-tert-Butyl 2-cyano-6-hydroxy-4,6-dimethyl-5-oxo-2-phenylheptanoate 79a

Prepared according to the general procedure starting from hydroxyketone $61(26 \mathrm{mg}, 0.2 \mathrm{mmol})$ and tert-butyl 2-cyano-2phenylacetate $\mathbf{4 4 a}(65 \mathrm{mg}, 0.3 \mathrm{mmol})$. The diastereomeric ratio was determined in the crude material (>99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): $81 \%(84 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{25}=+27.6^{\circ}$ ( $\mathrm{c}=0.7,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.61-7.49(\mathrm{~m}, 2 \mathrm{H}), 7.48-7.34$
(m, 3H), $3.33-3.20(\mathrm{~m}, 2 \mathrm{H}), 2.81$ (dd, $J=14.6,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.17$ (dd, $J=14.6,5.9 \mathrm{~Hz}$, $1 \mathrm{H}), 1.41(\mathrm{~d}, J=1.6 \mathrm{~Hz}, 6 \mathrm{H}), 1.39(\mathrm{~s}, 9 \mathrm{H}), 1.08(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 216.8,166.2,135.1,129.3,129.1,126.1,118.8,84.9,53.8,40.6,36.9,27.7$, 27.2, 27.0, 19.9. UPLC-DAD-QTOF: $\mathrm{C}_{20} \mathrm{H}_{27} \mathrm{NO}_{4} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 368.1838, found: 368.1836. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol 98/2, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 19.6 min (major.) and $24.5 \min$ (minor.)).

## (2S,4S)-tert-Butyl 2-cyano-6-hydroxy-4,6-dimethyl-5-oxo-2-(p-tolyl)heptanoate 79b

Prepared according to the general procedure starting from hydroxyketone $61(26 \mathrm{mg}, 0.2 \mathrm{mmol})$ and tert-butyl 2-cyano-2-(p-tolyl)acetate $\mathbf{4 4 b}$ ( $69 \mathrm{mg}, 0.3 \mathrm{mmol}$ ). The diastereomeric ratio was determined in the crude material (>99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): $67 \%$ $(72 \mathrm{mg}) .[\alpha]_{\mathrm{D}}{ }^{25}=+28.7^{\circ}\left(\mathrm{c}=0.85,97 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.43-$ 7.35 (m, 2H), $7.21-7.17$ (m, 2H), 3.32 (s, 1H), 3.25 (q, $J=6.3,5.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.78 (dd, $J$ $=14.6,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}), 2.14(\mathrm{dd}, J=14.6,5.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.40(\mathrm{~d}, J=1.5 \mathrm{~Hz}$, $6 \mathrm{H}), 1.38(\mathrm{~s}, 9 \mathrm{H}), 1.07(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 216.8,166.4$, 139.0, 132.0, 130.0, 126.0, 119.0, 84.8, 53.5, 40.6, 36.9, 27.7, 27.2, 27.0, 21.2, 20.0. UPLC-DAD-QTOF: $\mathrm{C}_{21} \mathrm{H}_{29} \mathrm{NO}_{4} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 382.1994, found: 382.1998. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol $85 / 15$, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 10.2 min (major.) and $12.1 \min$ (minor.)).

## (2S,4S)-tert-Butyl 2-cyano-6-hydroxy-2-(4-methoxyphenyl)-4,6-dimethyl-5oxoheptanoate 79c

Prepared according to the general procedure starting from hydroxyketone $61(26 \mathrm{mg}, 0.2 \mathrm{mmol})$ and tert-butyl 2-cyano-2-(4-methoxyphenyl)acetate $\mathbf{4 4 c}(74 \mathrm{mg}, 0.3 \mathrm{mmol})$. The diastereomeric ratio was determined in the crude material (>99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): $70 \%$ ( 79 mg ). $[\alpha]_{\mathrm{D}}{ }^{25}=+25.4^{\circ}\left(\mathrm{c}=0.85,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.53-7.35(\mathrm{~m}$, 2H), $6.97-6.84(\mathrm{~m}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.32(\mathrm{~s}, 1 \mathrm{H}), 3.26(\mathrm{q}, J=6.3,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.77$ (dd, $J=14.6,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-2.05(\mathrm{~m}, 1 \mathrm{H}), 1.40(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 6 \mathrm{H}), 1.39(\mathrm{~s}, 9 \mathrm{H})$, $1.08(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.9,166.3,139.2,135.0,129.8$, 129.2, 126.7, 123.1, 119.0, 84.8, 53.8, 40.7, 37.0, 27.7, 27.2, 27.0, 21.7, 19.9. UPLC-DAD-QTOF: $\mathrm{C}_{21} \mathrm{H}_{29} \mathrm{NO}_{5} \mathrm{Na} \quad[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 398.1943, found: 398.1942. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AY-H,
hexane/isopropanol 98/2, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 36.7 min (minor.) and 40.9 min (major.)).
(2S,4S)-tert-Butyl 2-(4-bromophenyl)-2-cyano-6-hydroxy-4,6-dimethyl-5oxoheptanoate 79d

Prepared according to the general procedure starting from hydroxyketone $\mathbf{6 1}(26 \mathrm{mg}, 0.2 \mathrm{mmol})$ and tert-butyl 2-cyano-2-(4-bromophenyl)acetate 44 d ( $88 \mathrm{mg}, 0.3 \mathrm{mmol}$ ). The diastereomeric ratio was determined in the crude material (98:2). Yield of pure major diastereomer after column chromatography purification (colourless oil): $69 \%$ ( 88 mg ). $[\alpha]_{\mathrm{D}}{ }^{25}=+18.5^{\circ}\left(\mathrm{c}=1.15,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.57-7.51(\mathrm{~m}$, 2 H ), $7.44-7.38(\mathrm{~m}, 2 \mathrm{H}), 3.27(\mathrm{q}, J=6.3,5.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.21(\mathrm{~s}, 1 \mathrm{H}), 2.81(\mathrm{dd}, J=14.6$, $5.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.10$ (dd, $J=14.6,5.7 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.40 ( $\mathrm{s}, 6 \mathrm{H}$ ), 1.39 (s, 9H), 1.09 (d, $J=6.9$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.6,165.8,134.2,132.5,127.9,123.5,118.4$, 85.4, 53.5, 40.6, 36.9, 27.7, 27.3, 27.1, 20.0. ## (2S,4S)-tert-Butyl 2-cyano-6-hydroxy-4,6-dimethyl-5-oxo-2-(m-tolyl)heptanoate 79f

Prepared according to the general procedure starting from hydroxyketone $61(26 \mathrm{mg}, 0.2 \mathrm{mmol})$ and tert-butyl 2-cyano-2-( $m$ tolyl)acetate $\mathbf{4 4 f}(69 \mathrm{mg}, 0.3 \mathrm{mmol})$. The diastereomeric ratio was determined in the crude material (>99:1). Yield of pure major diastereomer after column chromatography purification (colourless oil): $83 \%$ ( 89 mg ). $[\alpha]_{\mathrm{D}}{ }^{25}=+22.7^{\circ}\left(\mathrm{c}=2.35,97 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.35-7.24(\mathrm{~m}$, $3 \mathrm{H}), 7.19-7.12(\mathrm{~m}, 1 \mathrm{H}), 3.34(\mathrm{~s}, 1 \mathrm{H}), 3.31-3.22(\mathrm{~m}, 1 \mathrm{H}), 2.78(\mathrm{dd}, J=14.6,5.5 \mathrm{~Hz}$, $1 \mathrm{H}), 2.37(\mathrm{~s}, 3 \mathrm{H}), 2.12(\mathrm{dd}, J=14.6,6.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.40(\mathrm{~s}, 6 \mathrm{H}), 1.38(\mathrm{~s}, 9 \mathrm{H}), 1.07(\mathrm{~d}, J=$ $6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 216.9,166.3,139.2,135.0,129.8,129.2$, 126.7, 123.1, 119.0, 84.8, 53.8, 40.7, 37.0, 27.7, 27.2, 27.0, 21.7, 19.9. UPLC-DADQTOF: $\mathrm{C}_{21} \mathrm{H}_{29} \mathrm{NO}_{4} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 382.1994, found: 382.1991. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol 99/1, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 30.4 min (major.) and 43.1 min (minor.)).

### 6.4.3.4. General procedure for the addition to 3-methylbut-3-en-2-one as Michael acceptor

## (2S,4S)-tert-Butyl 2-cyano-4-methyl-5-oxo-2-phenylhexanoate 76

To a mixture of tert-butyl-2-cyano-phenylacetate $\mathbf{4 4 a}(69 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) and enone 75 ( $17 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) in 1,2-dichloroethane (DCE, 0.4 mL ), catalyst $\mathbf{C 4}(13 \mathrm{mg}, 0.02 \mathrm{mmol})$ was added. The resulting mixture was stirred until consumption of the electrophile (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction was treated with HCl 1 N and the product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic phases were dried over $\mathrm{MgSO}_{4}$. Evaporation of the solvent under reduced pressure gave the crude product. Diastereomeric ratio as determined in the crude material 80:20. Yield of mixture of diastereomers after column chromatography purification (eluent hexane/ethyl acetate, $95: 5$ ). Colourless oil: $45 \% ~(27 \mathrm{mg}) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.58-7.45$ (m, 2H), $7.45-7.30(\mathrm{~m}, 3 \mathrm{H}), 2.97(\mathrm{dd}, J=14.4,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.85-2.60(\mathrm{~m}, 1 \mathrm{H}), 2.18$ $(\mathrm{s}, 3 \mathrm{H}), 2.04-1.90(\mathrm{~m}, 1 \mathrm{H}), 1.41$ (minor., s, 3H), $1.39(\mathrm{~s}, 3 \mathrm{H}$ ), 1.19 (minor., d, $J=6.9$ $\mathrm{Hz}, 3 \mathrm{H}), 1.08(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 10.3,166.3,135.3,129.3$, 129.2, 129.0, 126.4, 126.2, 118.7, 84.7, 54.1, 44.3, 44.2, 39.7, 39.3 (minor.), 28.7 (minor.), 27.7, 18.6, 18.2 (minor.). UPLC-DAD-QTOF: $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 302.1756, found: 302.1750 . The enantiomeric purity was determined by HPLC analysis
(Daicel Chiralpak AD-H, hexane/isopropanol 99/1, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, retention times: 15.5 min (major.) and 17.2 min (minor.)).

### 6.4.3.5. Elaboration of adducts

### 6.4.3.5.1. To carboxylic acid 80

(2S,4S)-5-(tert-Butoxy)-4-cyano-2-methyl-5-oxo-4-phenylpentanoic acid 80
A suspension of sodium periodate $\mathrm{NaIO}_{4}(342 \mathrm{mg}, 1.6 \mathrm{mmol})$ in water $(0.8 \mathrm{~mL})$ was added to a solution of the $\alpha^{\prime}$-hydroxy ketone 79a ( 0.2 mmol ) in methanol ( 1 mL ). The mixture was stirred at room temperature until the reaction was complete (monitored by TCL, 24h). Then the solvent was removed under reduced pressure. Water ( 4.5 mL ) was added to the crude product and the resulting mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 6 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated to afford the corresponding carboxylic acid. After purification by flash column chromatography ( $80: 20 \mathrm{Hex}$ : EtOAc) the acid was obtained as a colorless oil (46 $\mathrm{mg}, 0.15 \mathrm{mmol}, 76 \%$ yield). $[\alpha]_{\mathrm{D}}{ }^{25}=+34.9^{\circ}\left(\mathrm{c}=2.45, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.57-7.49(\mathrm{~m}, 2 \mathrm{H}), 7.45-7.32(\mathrm{~m}, 3 \mathrm{H}), 2.93(\mathrm{dd}, J=14.4,7.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.68$ ( $\mathrm{tt}, J=7.3,3.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.09(\mathrm{dd}, J=14.5,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.40(\mathrm{~s}, 9 \mathrm{H}), 1.21(\mathrm{~d}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 181.3,166.0,135.2,129.3,129.0,126.1,118.3,84.9$, 53.9, 40.8, 37.1, 27.7, 18.8. UPLC-DAD-QTOF: $\mathrm{C}_{17} \mathrm{H}_{22} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 304.1549, found: 304.1553.

### 6.4.3.5.2. To aldehyde $\mathbf{7 8}$

## (2S,4S)-tert-Butyl 2-cyano-4-methyl-5-oxo-2-phenylpentanoate 78

$\mathrm{BH}_{3}$. THF complex ( $1 \mathrm{M}, 0.4 \mathrm{~mL}, 0.4 \mathrm{mmol}$ ) was added to a solution of $\alpha^{\prime}$-hydroxy ketone 79a ( $69 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) in dry THF $(0.9 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ and the resulting solution was stirred at the same temperature for 2 h . Then $\mathrm{MeOH}(1 \mathrm{~mL})$ was added and the resulting
mixture was stirred at room temperature for 30 min . The solvents were removed under reduced pressure and the residue thus obtained was subjected to oxidative scission by treatment with $\mathrm{NaIO}_{4}$, under the same conditions reported above. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $95 / 5$ ) to give the title compound as an oil ( $38 \mathrm{mg}, 0.13 \mathrm{mmol}, 66 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.62(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.57-7.49(\mathrm{~m}, 2 \mathrm{H}), 7.45-7.36(\mathrm{~m}, 3 \mathrm{H}), 2.97$ (dd, $J=14.5,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.67-2.51(\mathrm{~m}, 1 \mathrm{H}), 1.98(\mathrm{dd}, J=14.5,5.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.41(\mathrm{~s}$, 9 H ), 1.11 (d, $J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 202.3,180.6,135.2$, 129.4, $129.1,129.0,126.1,85.1,53.9,40.8,38.5,27.7,15.4$. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AY-H hexane/isopropanol 95/5, flow rate $=0.6 \mathrm{~mL} / \mathrm{min}$, retention times: 18.7 min (major.) and 22.2 min (minor.)).

### 6.4.4. ORTEP diagram of compound 79b

CCDC-1470018 contains the supplementary crystallographic data for the structural analysis of 79b. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

79b

### 6.4.5. Conjugate addition of azlactones to $\alpha$ '-trimethylsilyloxy enone $\mathbf{8 8}$

### 6.4.5.1. Asymmetric reaction

To a mixture of the corresponding azlactone ( 1 equiv., 0.2 mmol ) and the $\alpha$ 'silyloxyenone 88 ( 1.5 equiv., 0.3 mmol ) in dichloromethane ( 0.4 mL ) catalyst $\mathbf{C} 4$ was added at room temperature. The mixture was stirred at the same temperature, until consumption of the azlactone (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was then quenched with $1 \mathrm{M} \mathrm{HCl}(10 \mathrm{~mL})$ and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 20$ mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. For the desilylation the resulting crude was dissolved in $\mathrm{CH}_{3} \mathrm{CN}(1 \mathrm{~mL})$ and, $\mathrm{H}_{2} \mathrm{O}(0.5 \mathrm{~mL})$ and glacial acetic acid $(0.3 \mathrm{~mL})$ were added. The reaction mixture was stirred for 1 h at room temperature and it was quenched with $\mathrm{NaHCO}_{3}$ saturated aqueous solution ( 20 mL ). The organic solvent was evaporated under reduced pressure and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 20 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel to afford the expected adducts.

### 6.4.5.2. Racemic reaction

To a mixture of the corresponding azlactone 81-87 (1 equiv., 0.2 mmol ) and the $\alpha^{\prime}$-hydroxy enone $\mathbf{8 8}$ ( 1.5 equiv., 0.3 mmol ) in dichloromethane $(0.4 \mathrm{~mL}$ ) the achiral thiourea catalyst was added at room temperature. The mixture was stirred at the same temperature until consumption of the azlactone (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was then quenched with $1 \mathrm{M} \mathrm{HCl}(10 \mathrm{~mL})$ and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel to afford the expected adducts.

### 6.4.5.3. Characterization data for compounds 89-95

## (S)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-methyl-2-phenyloxazol-5(4H)-one 89a

The title compound was prepared from 4-methyl-2-phenyloxazol$5(4 H)$-one 81a ( $35 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$-silyloxy enone 88 ( 56 $\mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: $46 \mathrm{mg}, 0.16 \mathrm{mmol}, 78 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-23.4^{\circ}\left(\mathrm{c}=1.1,88 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.08-7.89(\mathrm{~m}, 2 \mathrm{H}), 7.69-7.55(\mathrm{~m}, 1 \mathrm{H}), 7.55-7.41(\mathrm{~m}, 2 \mathrm{H}), 3.56(\mathrm{~s}$, $1 \mathrm{H}), 2.72-2.45(\mathrm{~m}, 2 \mathrm{H}), 2.33-2.11(\mathrm{~m}, 2 \mathrm{H}), 1.55(\mathrm{~s}, 3 \mathrm{H}), 1.33(\mathrm{~d}, J=4.2 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.1,180.5,160.5,133.1,129.1,128.2,126.0,76.6,68.5$, 32.0, 30.3, 26.8, 23.9. UPLC-DAD-QTOF: $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 290.1392, found: 290.1396. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 8.3 min (major.) and 10.1 min (minor.)).

## (R)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-isopropyl-2-phenyloxazol-5(4H)-one 89b

The title compound was prepared from 4-isopropyl-2-phenyloxazol-5( $4 H$ )-one 81b ( $41 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha$ '-silyloxy enone $88(56 \mathrm{mg}, 0.3 \mathrm{mmol})$ according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $90 / 10$ ) to give the title compound as a yellow oil. Yield: $49 \mathrm{mg}, 0.15 \mathrm{mmol}, 77 \% .[\alpha]_{\mathrm{D}}{ }^{25}=+0.7^{\circ}\left(\mathrm{c}=0.65,90 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.04-7.98(\mathrm{~m}, 2 \mathrm{H}), 7.63-7.56(\mathrm{~m}, 1 \mathrm{H}), 7.54-7.47(\mathrm{~m}$, $2 \mathrm{H}), 3.50(\mathrm{~s}, 1 \mathrm{H}), 2.54-2.45(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.28(\mathrm{~m}, 1 \mathrm{H}), 2.26-2.13(\mathrm{~m}, 2 \mathrm{H}), 1.31(\mathrm{~s}$, $3 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}), 1.06(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.97(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\mathrm{CDCl}_{3}$ ) $\delta 213.2,180.1,160.7,133.1,129.1,128.2,125.7,76.5,75.6,35.2,30.3,28.9$, 26.8, 16.9. UPLC-DAD-QTOF: $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 318.1700, found: 318.1705.

The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 7.4 min (major.) and $8.3 \min$ (minor.)).

## (R)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-phenyloxazol-5(4H)-one 89c

The title compound was prepared from 4-isobutyl-2-phenyloxazol$5(4 \mathrm{H})$-one 81c ( $43 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$-silyloxy enone 88 ( 56 $\mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: $51 \mathrm{mg}, 0.15 \mathrm{mmol}, 75 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-28.7^{\circ}\left(\mathrm{c}=2.2,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.12-7.89(\mathrm{~m}, 2 \mathrm{H}), 7.64-7.56(\mathrm{~m}, 1 \mathrm{H}), 7.55-7.47(\mathrm{~m}, 2 \mathrm{H}), 3.55(\mathrm{~s}$, $1 \mathrm{H}), 2.62-2.44(\mathrm{~m}, 2 \mathrm{H}), 2.29-2.11(\mathrm{~m}, 2 \mathrm{H}), 1.97(\mathrm{dd}, J=14.0,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.82$ (dd, $J$ $=14.0,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.62(\mathrm{dq}, J=12.6,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.32(\mathrm{~s}, 3 \mathrm{H}), 1.30(\mathrm{~s}, 3 \mathrm{H}), 0.88(\mathrm{dd}, J$ $=10.4,6.6 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.1,180.7,160.3,133.1,129.1$, 128.6, 125.8, 76.6, 72.0, 46.2, 32.5, 29.9, 26.7, 25.0, 24.3, 23.3. UPLC-DAD-QTOF: $\mathrm{C}_{19} \mathrm{H}_{26} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 332.1856 , found: 332.1860 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol 99/1, flow rate= $1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 43.3 min (major.) and 52.4 min (minor.)).

## (R)-4-Benzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)-2-phenyloxazol-5(4H)-one 89d

The title compound was prepared from 4-benzyl-2-phenyloxazol$5(4 \mathrm{H})$-one 81d ( $50 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha$ '-silyloxy enone $\mathbf{8 8}$ (56 $\mathrm{mg}, 0.3 \mathrm{mmol})$ according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: $41 \mathrm{mg}, 0.14 \mathrm{mmol}, 72 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-70.5^{\circ}\left(\mathrm{c}=2.2,88 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86-7.80(\mathrm{~m}, 2 \mathrm{H}), 7.58-7.50(\mathrm{~m}, 1 \mathrm{H}), 7.47-7.40(\mathrm{~m}, 2 \mathrm{H}), 7.16(\mathrm{~m}$, 5 H ), $3.56(\mathrm{~s}, 1 \mathrm{H}), 3.31-3.12(\mathrm{~m}, 2 \mathrm{H}), 2.71-2.51(\mathrm{~m}, 2 \mathrm{H}), 2.45-2.28(\mathrm{~m}, 2 \mathrm{H}), 1.32(\mathrm{~s}$, $3 \mathrm{H}), 1.30(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.0,179.4,160.6,134.0,133.0,130.3$, $128.9,128.4,128.0,127.6,125.5,76.6,73.8,43.9,31.2,30.4,26.8$. UPLC-DAD-QTOF: $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 366.1700 , found: 366.1709 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 95/5, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 22.5 min (minor.) and 25.9 min (major.)).

## (R)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-2,4-diphenyloxazol-5(4H)-one 89e

The title compound was prepared from 2,4-diphenyloxazol-5(4H)one 81e ( $48 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$-silyloxy enone $\mathbf{8 8}(56 \mathrm{mg}, 0.3$ $\mathrm{mmol})$ according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: 50 mg , $0.14 \mathrm{mmol}, 71 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-108.0^{\circ}\left(\mathrm{c}=2.3,90 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 8.11-8.05(\mathrm{~m}, 2 \mathrm{H}), 7.69-7.59(\mathrm{~m}, 3 \mathrm{H}), 7.56-7.50(\mathrm{~m}, 2 \mathrm{H}), 7.39(\mathrm{~m}, 3 \mathrm{H}), 3.57(\mathrm{~s}$, $1 \mathrm{H}), 2.80-2.38(\mathrm{~m}, 4 \mathrm{H}), 1.32(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.1$, $178.5,160.9,137.3,133.3,129.1,129.1,128.8,128.4,126.0,125.8,76.6,73.2,34.6$, 30.5, 26.7. UPLC-DAD-QTOF: $\mathrm{C}_{21} \mathrm{H}_{22} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 352.1549 , found: 352.1551 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 8.8 min (minor.) and 12.7 min (major.)).

## (R)-2-(4-Chlorophenyl)-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-isobutyloxazol-5(4H)-

 one 91c

The title compound was prepared from 2-(4-chlorophenyl)-4-isobutyloxazol- $5(4 \mathrm{H})$-one $\mathbf{8 2}$ ( $50 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$ silyloxyenone $\mathbf{8 8}$ ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $90 / 10$ ) to give the title compound as a yellow oil. Yield: $51 \mathrm{mg}, 0.14 \mathrm{mmol}, 72 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-16.2^{\circ}\left(\mathrm{c}=2.9,86 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.97-7.91(\mathrm{~m}, 2 \mathrm{H}), 7.52-7.44(\mathrm{~m}, 2 \mathrm{H}), 3.49(\mathrm{~s}, 1 \mathrm{H}), 2.60-2.48(\mathrm{~m}$, $2 \mathrm{H}), 2.25-2.15(\mathrm{~m}, 2 \mathrm{H}), 1.96(\mathrm{dd}, J=14.0,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.81(\mathrm{dd}, J=14.0,7.1 \mathrm{~Hz}, 1 \mathrm{H})$, $1.66-1.52(\mathrm{~m}, 1 \mathrm{H}), 1.32(\mathrm{~s}, 3 \mathrm{H}), 1.30(\mathrm{~s}, 3 \mathrm{H}), 0.88(\mathrm{dd}, J=9.6,6.6 \mathrm{~Hz}, 6 \mathrm{H}){ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 212.99,180.34,159.48,139.51,129.48,129.42,129.08,127.50$, $124.22,76.57,72.10,46.07,32.41,29.95,26.75,25.03,24.24,23.30$. UPLC-DADQTOF: $\mathrm{C}_{19} \mathrm{H}_{25} \mathrm{ClNO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 366.1472, found: 366.1474. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 98/2, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 26.2 min (minor.) and 30.7 min (major.)).

## (R)-2-(2,6-Dichlorophenyl)-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-isobutyloxazol-

 5(4H)-one 92c

The title compound was prepared from 2-(2,6-dichlorophenyl)-4-isobutyloxazol-5(4H)-one 83c ( $48 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$ silyloxy enone 88 ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $90 / 10$ ) to give the title compound as a yellow oil. Yield: $56 \mathrm{mg}, 0.14 \mathrm{mmol}, 69 \%$. $[\alpha]_{\mathrm{D}}{ }^{25}=+12.9^{\circ}\left(\mathrm{c}=1.1,70 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.52-7.33(\mathrm{~m}$, $3 \mathrm{H}), 3.52(\mathrm{~s}, 1 \mathrm{H}), 2.97-2.69(\mathrm{~m}, 1 \mathrm{H}), 2.69-2.44(\mathrm{~m}, 1 \mathrm{H}), 2.25(\mathrm{~d}, \mathrm{~J}=15.3 \mathrm{~Hz}, 2 \mathrm{H})$, $2.03(\mathrm{~d}, \mathrm{~J}=12.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.97-1.69(\mathrm{~m}, 2 \mathrm{H}), 1.36(\mathrm{~s}, 6 \mathrm{H}), 0.97(\mathrm{t}, J=6.4 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.9,180.0,157.2,135.0,132.8,128.7,127.0,76.5,72.3$, 46.1, 32.0, 30.4, 26.8, 24.9, 23.3. UPLC-DAD-QTOF: $\mathrm{C}_{19} \mathrm{H}_{24} \mathrm{Cl}_{2} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 400.1082, found: 400.1079. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 7.7 min (major.) and 15.5 min (minor.)).

## (R)-4-Benzyl-2-(2,6-dichlorophenyl)-4-(4-hydroxy-4-methyl-3-oxopentyl)oxazol-5(4H)-one 92d

The title compound was prepared from 4-benzyl-2-(2,6-dichlorophenyl)oxazol-5(4H)-one 83d ( $64 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha$ 'silyloxy enone $\mathbf{8 8}$ ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: $76 \mathrm{mg}, 0.18 \mathrm{mmol}$, $88 \% .[\alpha]_{\mathrm{D}}{ }^{25}=+20.5^{\circ}\left(\mathrm{c}=0.8,88 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.39-$ 7.32 (m, 2H), $7.31-7.19(\mathrm{~m}, 6 \mathrm{H}), 3.51(\mathrm{~s}, 1 \mathrm{H}), 3.38-3.18(\mathrm{~m}, 2 \mathrm{H}), 2.86$ (ddd, $J=17.8$, $8.8,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.72-2.51(\mathrm{~m}, 1 \mathrm{H}), 2.35(\mathrm{dd}, J=8.9,7.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.35(\mathrm{~d}, J=4.4 \mathrm{~Hz}$, $6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 212.8,179.2,157.4,135.0,134.1,132.7,130.8,128.8$, $128.4,127.7,76.5,73.8,43.3,31.3,30.6,26.8,26.8$. UPLC-DAD-QTOF: $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{Cl}_{2} \mathrm{NO}_{4}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 434.0926, found: 434.0919. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate= 1.0 $\mathrm{mL} / \mathrm{min}$, retention times: 13.5 min (major.) and 27.0 min (minor.)).

## (R)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-(4-methoxyphenyl)oxazol-5(4H)-one 93c

The title compound was prepared from 4-isobutyl-2-(4-methoxyphenyl)oxazol-5(4H)-one $84(50 \mathrm{mg}, 0.2 \mathrm{mmol})$ and $\alpha$ '-silyloxyenone $\mathbf{8 8}$ ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $90 / 10$ ) to give the title compound as a yellow oil. Yield: $51 \mathrm{mg}, 0.14 \mathrm{mmol}, 70 \% \cdot[\alpha]_{\mathrm{D}}{ }^{25}=-24.4^{\circ}\left(\mathrm{c}=1.9,90 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta: 7.99-7.90(\mathrm{~m}, 2 \mathrm{H}), 7.03-6.96$ (m, 2H), 3.88 (s, 3H), 3.62 (s, $1 \mathrm{H}), 2.65-2.45(\mathrm{~m}, 2 \mathrm{H}), 2.27-2.11(\mathrm{~m}, 2 \mathrm{H}), 1.95(\mathrm{dd}, J=14.0,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.80(\mathrm{dd}, J$ $=14.0,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.70-1.51(\mathrm{~m}, 1 \mathrm{H}), 1.32(\mathrm{~s}, 3 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}), 0.88(\mathrm{dd}, J=11.2,6.6$ $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl} 3$ ), $\delta: 213.16,180.88,163.53,160.01,130.04,118.02$, 114.51, 76.54, 71.84, 55.71, 46.21, 32.68, 29.98, 26.74, 26.72, 25.04, 24.27, 23.33. UPLC-DAD-QTOF: $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{NO}_{5}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 362.1967, found: 362.1972. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 10.2 min (minor.) and 12.2 min (major.)).

## ( $\boldsymbol{R}$ )-4-Benzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)-2-phenyloxazol-5(4H)-one 94d

The title compound was prepared from 4-benzyl-2-( $m-$ tolyl)oxazol-5( $4 H$ )-one 85 ( $53 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and $\alpha^{\prime}$-silyloxy enone 88 ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate $90 / 10$ ) to give the title compound as a yellow oil. Yield: 49 mg , $0.13 \mathrm{mmol}, 65 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-80.7^{\circ}\left(\mathrm{c}=2.2,86 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.73-7.52(\mathrm{~m}, 2 \mathrm{H}), 7.40-7.23(\mathrm{~m}, 2 \mathrm{H}), 7.22-7.06(\mathrm{~m}, 5 \mathrm{H}), 3.62(\mathrm{~s}, 1 \mathrm{H}), 3.30-3.09$ (m, 2H), 2.72-2.48(m, 2H), 2.37 (s, 3H), $2.37-2.27$ (m, 2H), 1.31 (s, 3H), 1.29 ( $\mathrm{s}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.0,179.4,160.8,138.8,134.0,133.8,130.3,128.8$, 128.5, 128.4, 127.5, 125.4, 125.2, 76.6, 73.7, 43.8, 31.3, 30.4, 26.8, 26.7, 21.4. UPLC-DAD-QTOF: $\mathrm{C}_{23} \mathrm{H}_{26} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 380.1862 , found: 380.1870 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AS-H, hexane/isopropanol $95 / 5$, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 14.1 min (minor.) and 22.6 min (major.)).

## (R)-4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-(naphthalen-2-yl)oxazol-5(4H)-one 95c

The title compound was prepared from 4-isobutyl-2-(naphthalen-2-yl)oxazol-5(4H)-one $86(53 \mathrm{mg}, 0.2 \mathrm{mmol})$ and $\alpha^{\prime}$-silyloxy enone $\mathbf{8 8}$ ( $56 \mathrm{mg}, 0.3 \mathrm{mmol}$ ) according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 90/10) to give the title compound as a yellow oil. Yield: $50 \mathrm{mg}, 0.13 \mathrm{mmol}, 66 \% .[\alpha]_{\mathrm{D}}{ }^{25}=+5.3^{\circ}\left(\mathrm{c}=2.7,66 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.57-8.43(\mathrm{~m}, 1 \mathrm{H}), 8.06(\mathrm{dd}, J=8.6,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.01-$ $7.80(\mathrm{~m}, 3 \mathrm{H}), 7.69-7.35(\mathrm{~m}, 2 \mathrm{H}), 3.55(\mathrm{~s}, 1 \mathrm{H}), 2.72-2.44(\mathrm{~m}, 2 \mathrm{H}), 2.37-2.16(\mathrm{~m}, 2 \mathrm{H})$, $2.08-1.92(\mathrm{~m}, 1 \mathrm{H}), 1.91-1.77(\mathrm{~m}, 1 \mathrm{H}), 1.78-1.59(\mathrm{~m}, 1 \mathrm{H}), 1.31(\mathrm{~d}, J=8.9 \mathrm{~Hz}, 6 \mathrm{H})$, $0.90(\mathrm{dd}, J=9.4,6.6 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 213.1,180.7,160.5,135.5$, 132.8, 129.7, 129.3, 129.1, 128.7, 128.1, 127.3, 123.6, 122.9, 76.6, 72.2, 46.3, 32.6, 30.0, 26.7, 25.1, 24.3, 23.3. UPLC-DAD-QTOF: $\mathrm{C}_{23} \mathrm{H}_{28} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 382.2018, found: 382.2024. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 10.4 min (minor.) and 13.1 min (major.)).

### 6.4.5.4. Elaboration of adducts $\mathbf{8 9}$ into carboxylic acids 97

$\mathbf{1}^{\text {st }}$ step: To a solution of $\alpha$-hydroxy ketone $\mathbf{8 9}(0.5 \mathrm{mmol})$ in $\mathrm{MeOH}(2.5 \mathrm{~mL}, 5$ $\mathrm{mL} / \mathrm{mmol}) 2$ drops of triflic acid were added and the solution was stirred at room temperature until completion of reaction ( 1 h ). After that the solvent was removed under reduced pressure, and the crude material was purified by flash column chromatography on silica gel.

## (R)-Methyl 2-benzamido-6-hydroxy-2-isobutyl-6-methyl-5-oxoheptanoate 96c

The title compound 96 c was prepared from $(R)$-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-phenyloxazol-5(4H)-one 89c $(166 \mathrm{mg}, 0.5 \mathrm{mmol})$. The reaction mixture was stirred for 1 h until completion of reaction. After evaporating the organic solvent the crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 80/20) to give the title compound as a white foam.

Yield: $174 \mathrm{mg}, 0.48 \mathrm{mmol}, 95 \% .[\alpha]_{\mathrm{D}}{ }^{25}=+4.5^{\circ}\left(\mathrm{c}=0.75, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.83-7.78(\mathrm{~m}, 2 \mathrm{H}), 7.55-7.43(\mathrm{~m}, 3 \mathrm{H}), 7.33(\mathrm{~s}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 3.55(\mathrm{~s}$, $1 \mathrm{H}), 2.97-2.85(\mathrm{~m}, 1 \mathrm{H}), 2.73-2.51(\mathrm{~m}, 2 \mathrm{H}), 2.38-2.21(\mathrm{~m}, 2 \mathrm{H}), 1.83(\mathrm{dd}, J=14.2$, $7.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.60(\mathrm{dd}, J=13.6,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.29(\mathrm{~s}, 6 \mathrm{H}), 0.85(\mathrm{dd}, J=26.6,6.6 \mathrm{~Hz}, 6 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.6,175.6,166.2,134.9,131.9,128.9,126.9,76.5,63.9$, 53.2, 43.8, 30.8, 30.6, 26.8, 26.7, 25.1, 23.9, 22.8. UPLC-DAD-QTOF: $\mathrm{C}_{20} \mathrm{H}_{30} \mathrm{NO}_{5}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 364.2124 , found: 364.2124 .

## (R)-Methyl 2-benzamido-2-benzyl-6-hydroxy-6-methyl-5-oxoheptanoate 96d

The title compound $96 \mathbf{d}$ was prepared from $(R)$-4-(4 hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-phenyloxazol-5(4H)-one 89d $(183 \mathrm{mg}, 0.5 \mathrm{mmol})$ following the general procedure. The reaction mixture was stirred for 1 h until completion of reaction. After evaporating the organic solvent the crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 80/20) to give the title compound as a white foam. Yield: $199 \mathrm{mg}, 0.5 \mathrm{mmol},>99 \% .[\alpha]_{\mathrm{D}}{ }^{25}=-52.3^{\circ}$ ( $\mathrm{c}=1.01$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.71-7.65(\mathrm{~m}, 2 \mathrm{H}), 7.54-7.38(\mathrm{~m}, 3 \mathrm{H}), 7.19$ $(\mathrm{m}, 2 \mathrm{H}), 7.04-6.96(\mathrm{~m}, 3 \mathrm{H}), 3.87(\mathrm{~d}, J=13.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 3.26(\mathrm{~d}, J=13.5$ $\mathrm{Hz}, 1 \mathrm{H}), 3.10-2.96(\mathrm{~m}, 1 \mathrm{H}), 2.77-2.57(\mathrm{~m}, 1 \mathrm{H}), 2.50-2.32(\mathrm{~m}, 2 \mathrm{H}), 1.29(\mathrm{~d}, J=3.9$ $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.7$, 173.7, 166.9, 136.1, 134.9, 131.9, 129.9, 128.9, 128.5, 127.3, 126.9, 76.5, 65.7, 53.2, 40.9, 30.9, 29.9, 26.7, 26.7. UPLC-DADQTOF: $\mathrm{C}_{23} \mathrm{H}_{28} \mathrm{NO}_{5}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 398.1962, found: 398.1967.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p : ~ T h e ~ r e s i d u e ~ o b t a i n e d ~ i n ~ t h e ~ p r e v i o u s ~ s t e p ~ w a s ~ d i s s o l v e d ~ i n ~} \mathrm{MeOH}$ and to this solution a suspension of sodium periodate $\mathrm{NaIO}_{4}(535 \mathrm{mg}, 2.5 \mathrm{mmol}, 5$ equiv.) in water ( 1.5 mL ) was added. The reaction mixture was stirred at room temperature until completion of reaction ( 1 h ). The solvent was then removed under reduced pressure, water ( 4.5 mL ) was added to the residue and the resulting mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 6 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated to afford the corresponding carboxylic acid. The crude was purified by flash column chromatography on silica gel.

## (R)-4-Benzamido-4-(methoxycarbonyl)-6-methylheptanoic acid 97c

The title compound 97c was prepared from ( $R$ )-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-isobutyl-2-phenyloxazol-5(4H)-one 96c $(182 \mathrm{mg}, 0.5 \mathrm{mmol})$ and $\mathrm{NaIO}_{4}(535 \mathrm{mg}, 2.5 \mathrm{mmol})$ according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 60/40) to give the title compound as a white foam. Yield: $138 \mathrm{mg}, 0.43 \mathrm{mmol}, 86 \%$ over two steps. $[\alpha]_{\mathrm{D}}{ }^{25}=-77.0^{\circ}\left(\mathrm{c}=0.5, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.81-7.76(\mathrm{~m}, 2 \mathrm{H}), 7.53$ - $7.32(\mathrm{~m}, 3 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 3.02-2.88(\mathrm{~m}, 1 \mathrm{H}), 2.67(\mathrm{dd}, J=14.2,5.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.38-$ $2.03(\mathrm{~m}, 3 \mathrm{H}), 1.78(\mathrm{dd}, J=14.2,7.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.57(\mathrm{~m}, 1 \mathrm{H}), 0.88(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.78$ $(\mathrm{d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 178.2,175.3,166.5,134.7,131.9$, 128.9, 127.1, 63.9, 53.2, 43.7, 31.2, 29.3, 25.0, 23.9, 22.7. UPLC-DAD-QTOF: $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{NO}_{5}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 322.1649, found: 322.1653.

## ( $R$ )-4-Benzamido-4-benzyl-5-methoxy-5-oxopentanoic acid 97d

The title compound 97d was prepared from ( $R$ )-4-benzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)-2-phenyloxazol-5(4H)-one 96d ( $199 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and $\mathrm{NaIO}_{4}(535 \mathrm{mg}, 2.5 \mathrm{mmol})$ according to the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ ethyl acetate 60/40) to give the title compound as a white foam. Yield: $160 \mathrm{mg}, 0.45 \mathrm{mmol}, 89 \%$ over two steps. $[\alpha]_{\mathrm{D}}{ }^{25}=-14.8^{\circ}\left(\mathrm{c}=2.6, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.74-7.65(\mathrm{~m}, 2 \mathrm{H}), 7.55$ - 7.43 (m, 1H), $7.40(\mathrm{~m}, 2 \mathrm{H}), 7.22-7.15(\mathrm{~m}, 2 \mathrm{H}), 7.09-6.99(\mathrm{~m}, 3 \mathrm{H}), 3.91(\mathrm{~d}, J=13.6$ $\mathrm{Hz}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.23(\mathrm{~d}, J=13.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.15-3.05(\mathrm{~m}, 1 \mathrm{H}), 2.51-2.31(\mathrm{~m}$, $2 \mathrm{H}), 2.26-2.14(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 178.0,173.5,167.3,136.0$, $134.8,131.9,129.8,128.8,128.5,127.2,127.1,65.7,53.1,40.7,30.4,29.5$. UPLC-DADQTOF: $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{NO}_{5}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 356.1492, found: 356.1496.
6.4.5.5. Synthesis of glutamic acid analogue $\mathbf{9 8}^{342}$

[^115]
## 2-(R)-Benzylglutamic acid hydrochloride 98

(R)-4-Benzamido-4-benzyl-5-methoxy-5-oxopentanoic acid 97d (355 $\mathrm{mg}, 0.75 \mathrm{mmol}$ ) was treated with 5 mL of $20 \% \mathrm{HCl}$ for 4 h at reflux. After standing overnight in the refrigerator, the resulting crystals of benzoic acid were removed by filtration and the filtrate was washed twice with diethyl ether. The solution was evaporated to dryness in vaccuo. The residue was dissolved in a small amount of water and the solution was evaporated to dryness again in order to remove any trace of HCl . Finally, the product was dried overnight in the lyophilizator to obtain a white solid. Yield: $151 \mathrm{mg}, 0.64 \mathrm{mmol}, 85 \%$. m.p. $195-199{ }^{\circ} \mathrm{C}$. $[\alpha]_{\mathrm{D}}{ }^{25}=-0.98^{\circ}(\mathrm{c}=3.3,4 \mathrm{~N} \mathrm{HCl})$; Literature data for the opposite enantiomer: $[\alpha]_{\mathrm{D}}{ }^{25}=$ $+1.44^{\circ}(\mathrm{c}=6.39,4 \mathrm{~N} \mathrm{HCl}) .{ }^{343}{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) \delta 7.50-7.38(\mathrm{~m}, 3 \mathrm{H}), 7.36-$ $7.30(\mathrm{~m}, 2 \mathrm{H}), 3.46(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.14(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.70-2.50(\mathrm{~m}, 2 \mathrm{H})$, $2.46-2.32(\mathrm{~m}, 1 \mathrm{H}), 2.30-2.16(\mathrm{~m}, 1 \mathrm{H}){ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) \delta 174.9,172.5,132.8$, 130.6, 129.6, 128.7, 63.9, 41.3, 30.7, 28.6.

### 6.4.6. Computational studies

An extensive search for different H -bond combination patterns was carried out in line with the proposed activation ternary complexes $\mathbf{A}, \mathbf{B}$, and $\mathbf{C}$.

A

B

Figure 38. Previously proposed activation ternary complexes.

Only transition structures belonging to A-type activation (TS-R $\mathbf{1}, \mathbf{T S}-\mathbf{S}_{\mathbf{1}}, \mathbf{T S}-\mathbf{R}_{\mathbf{2}}$ and $\mathbf{T S}-\mathbf{S}_{\mathbf{2}}$ ) are predicted to have feasible energies (Figure 39), whereas a single structure of too high energy presented pattern $\mathbf{C}\left(\mathbf{T S}-\mathbf{R}_{\mathbf{C}}\right)$, and no plausible structure of type $\mathbf{B}$ was located. In what can be considered the saddle point closest to $\mathbf{B}$ ( $\mathbf{T S}-\mathbf{S}_{\mathbf{B}}$ ), the cyanoacetate is activated by three H -bonds, while the electrophilic hydroxyenone remains non-bonded. This structure can be discarded, as it presents too high energy, and predicts the formation of the wrong $S$ enantiomer. The corresponding TS for the formation of the $R$ enantiomer could not be located.

### 6.5. EXPERIMENTAL SECTION OF CHAPTER 3

### 6.5.1. Synthesis of 4 -substituted pyrrolidin-2,3-diones

General procedure for the synthesis of 4-substituted pyrrolidin-2,3-diones:

### 6.5.1.1. Synthesis of acrylates

Methyl acrylate 132a is commercial and others were prepared according to the following procedure.

## Preparation of alkyl acrylates: ${ }^{344}$

$\mathbf{1}^{\text {st }}$ step: To a suspension of potassium tert-butoxide (1.2 equiv.) in THF ( 2.5 $\mathrm{mL} / \mathrm{mmol}$ ) methyl acetate ( 1 equiv.) and tert-butanol ( 0.1 equiv.) were added at $0^{\circ} \mathrm{C}$. The resulting mixture was stirred for 30 min at $0^{\circ} \mathrm{C}$ and then the corresponding alkyl halide

[^117]( 0.99 equiv.) was added. The mixture was warmed up to $70^{\circ} \mathrm{C}$ for 12 h . The reaction was quenched with $\mathrm{NaHCO}_{3}(4 \mathrm{~mL} / \mathrm{mmol})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $3 \times 5 \mathrm{~mL} / \mathrm{mmol}$ ). The organic layers were combined and dried over $\mathrm{MgSO}_{4}$. The mixture was concentrated under reduced pressure to afford the desired product which was purified by flash column chromatography.
( $\pm$ ) Methyl 2-ethyl-3-oxobutanoate 131b

The title compound was prepared according to the general procedure from methyl acetoacetate ( $6.48 \mathrm{~mL}, 60 \mathrm{mmol}, 1$ equiv.) and ethyl iodide ( 4.8 $\mathrm{mL}, 59.4 \mathrm{mmol}, 0.99$ equiv.). The crude was purified by flash column chromatography (hexane/EtOAc, 90:10) affording a colourless oil ( $6.92 \mathrm{~g}, 48 \mathrm{mmol}$, $80 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 3.73(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.21(\mathrm{~s}, 3 \mathrm{H})$, $1.89(\mathrm{dd}, J=12.2,4.9 \mathrm{~Hz}, 2 \mathrm{H}), 0.93(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.
( $\pm$ ) Methyl 2-benzyl-3-oxobutanoate 131c

The title compound was prepared according to the general procedure from methyl acetoacetate ( $6.48 \mathrm{~mL}, 60 \mathrm{mmol}, 1$ equiv.) and benzyl bromide ( 7.1 $\mathrm{mL}, 59.4 \mathrm{mmol}, 0.99$ equiv.). The crude was purified by flash column chromatography (hexane/EtOAc, 95:5) affording a colourless oil ( 8.04 g , $39 \mathrm{mmol}, 65 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.37-7.10(\mathrm{~m}, 5 \mathrm{H}), 4.12$ (q, $J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.17(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.18(\mathrm{~s}, 3 \mathrm{H})$.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p}:$ Retro-Claisen Reaction. LiHMDS (1.1 equiv.) was added dropwise to a solution of the alkyl acetoacetate ( 1 equiv.) in THF ( $8 \mathrm{~mL} / \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$. After 30 min , paraformaldehyde ( 1 equiv.) was added and the resultant mixture was warmed to r.t. over 6 h . Then reaction mixture was filtered over celite and all organic solvents were removed under reduced pressure. The resulting crude was purified by flash column chromatography.

## Methyl 2-methylenebutanoate $\mathbf{1 3 2 b}^{345}$

CO $\mathrm{CO}_{2} \mathrm{Me}$ The title compound was prepared according to the general procedure from methyl 2-ethyl-3-oxobutanoate ( $6.92 \mathrm{~g}, 48 \mathrm{mmol}$ ). The crude was purified by flash column chromatography (hexane/EtOAc, 90:10) affording a colourless oil ( 3.6 g , $31.2 \mathrm{mmol}, 65 \%)$. All the spectroscopic data were identical to the reported in the literature. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.13(\mathrm{~d}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.53(\mathrm{~d}, J=1.5 \mathrm{~Hz}$, $1 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 2.52-2.19(\mathrm{~m}, 2 \mathrm{H}), 1.08(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.

[^118]
## Methyl 2-benzylacrylate $132 \mathbf{c}^{346}$

The title compound was prepared according to the general procedure from methyl 2-benzyl-3-oxobutanoate $(8.04 \mathrm{~g}, 39 \mathrm{mmol})$. The crude was purified by flash column chromatography (hexane/EtOAc, 98:2) affording a colourless oil ( $4.82 \mathrm{~g}, 27.3 \mathrm{mmol}, 70 \%$ ). All the spectroscopic data were identical to the reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.39-7.10(\mathrm{~m}$, $5 \mathrm{H}), 6.24(\mathrm{~d}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.46(\mathrm{q}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{~s}, 2 \mathrm{H})$.

## Preparation of the aromatic acrylate 132d: ${ }^{344}$

## Methyl 2-phenylacrylate 132d ${ }^{347}$

Phenyl magnesium bromide ( $15.15 \mathrm{~mL}, 1 \mathrm{M}$ in $\mathrm{THF}, 1.01$ equiv.) was added dropwise to a solution of methyl pyruvate ( $1.36 \mathrm{~mL}, 15 \mathrm{mmol}, 1$ equiv.) in THF (4 $\mathrm{mL} / \mathrm{mmol}$ ). After the addition was complete, the mixture was heated to $60^{\circ} \mathrm{C}$ and stirred for 1 h ; then cooled, hydrolyzed by the addition of water ( $1 \mathrm{~mL} / \mathrm{mmol}$ ) and subsequently treated with $1 \mathrm{M} \mathrm{HCl}(2 \mathrm{~mL} / \mathrm{mmol})$ to dissolve the precipitate that had been formed. The mixture was filtered and extracted with ethyl acetate ( $3 \times 2 \mathrm{~mL} / \mathrm{mmol}$ ). The combined organic layers were washed with brine ( $2 \times 1 \mathrm{~mL} / \mathrm{mmol}$ ), dried over $\mathrm{MgSO}_{4}$, filtered and evaporated. Without further purification, the resulting alcohol was added to a stirred solution of $p$-toluenesulfonic acid ( 0.1 equiv.) in toluene ( $10 \mathrm{~mL} / \mathrm{mmol}$ ) and the reaction mixture was stirred at refluxed temperature under a Dean-Stark trap for 4 h . The cooled reation mixture was diluted with ether ( 30 mL ) and washed successively with $\mathrm{NaHCO}_{3}$ solution ( $1 \mathrm{~mL} / \mathrm{mmol}$ ). The combined organic layers were washed with brine (1 $\mathrm{mL} / \mathrm{mmol}$ ), dried with $\mathrm{MgSO}_{4}$, filtered and evaporated. Purification on flash column chromatography (hexane/EtOAc, 98:2) produced the corresponding ester as colourless oil $(1.70 \mathrm{~g}, 10.5 \mathrm{mmol}, 70 \%)$. All the spectroscopic data were identical to the reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.43-7.34(\mathrm{~m}, 5 \mathrm{H}), 6.37(\mathrm{~d}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H})$, $5.90(\mathrm{~d}, \mathrm{~J}=1.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 167.4,141.4,136.8$, 128.4, 128.3, 128.2, 127.0, 52.3.

[^119]
### 6.5.1.2. Addition of amines to acrylates: $\beta$-Amino esters synthesis

$\beta$-Amino esters were synthesized by the addition of the corresponding amine to the $\alpha$-substituted acrylate. The best results were obtained with catalytic amounts of manganese chloride (METHOD A) but with hindered amines, such as isopropyl amine, the use of ruthenium (III) chloride as catalyst and poly ethylene glycol as solvent were necessary (METHOD B).

## METHOD A ${ }^{348}$

A mixture of the amine ( 1 equiv.), the acrylate ( 1 equiv.) and manganese chloride $(10 \mathrm{~mol} \%)$ in $\mathrm{H}_{2} \mathrm{O}(0.6 \mathrm{~mL} / \mathrm{mmol})$ and $\mathrm{MeOH}(0.6 \mathrm{~mL} / \mathrm{mmol})$ was kept at r.t. under vigorous stirring for 20 h . After completion of the reaction, methanol was evaporated and the residue dissolved in $\operatorname{EtOAc}(20 \mathrm{~mL} / \mathrm{mmol})$. All salts were filtered, the organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 5 \mathrm{~mL} / \mathrm{mmol})$ and brine ( $2 \times 5 \mathrm{~mL} / \mathrm{mmol}$ ), dried over $\mathrm{MgSO}_{4}$ and evaporated. The crude product was purified by flash column chromatography on silica gel.

METHOD B ${ }^{349}$

$\mathrm{RuCl}_{3} \cdot \mathrm{H}_{2} \mathrm{O}(0.022 \mathrm{~g}, 0.1 \mathrm{mmol}$ ) was added to a mixture of PEG (average MW $2000,8 \mathrm{~g}$ ), amine ( $20 \mathrm{mmol}, 1$ equiv.) and methyl acrylate ( $20 \mathrm{mmol}, 1$ equiv.). The reaction mixture was kept at $50^{\circ} \mathrm{C}$ for 16 h by magnetic stirring and then cooled to r.t. The mixture was poured into $\mathrm{Et}_{2} \mathrm{O}(40 \mathrm{~mL})$ and then it was kept cooling in a refrigerator for 30 min to aid precipitation. The precipitate was filtered and washed with further portions of $\mathrm{Et}_{2} \mathrm{O}$, and the washings were combined with the initial filtrate. The combined

[^120]organic phases were washed several times with $\mathrm{H}_{2} \mathrm{O}$ and dried $\left(\mathrm{MgSO}_{4}\right)$. After filtration and removal of the solvent, the product was purified by flash column chromatography (eluent 1:1 Hex:EtOAc).

## ( $\pm$ ) Methyl 3-(benzylamino)-2-methylpropanoate 138a ${ }^{350}$

Prepared according to METHOD A starting from benzylamine $(2.18 \mathrm{~mL}, 20 \mathrm{mmol})$ and methyl methacrylate $(2.13 \mathrm{~mL}, 20$ mmol ). The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $3.32 \mathrm{~g}, 16.0 \mathrm{mmol}$, $80 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.36-7.28(\mathrm{~m}, 3 \mathrm{H}), 7.27-7.19(\mathrm{~m}, 2 \mathrm{H}), 3.79(\mathrm{~s}$, 2 H ), 3.69 ( $\mathrm{s}, 3 \mathrm{H}$ ), 2.88 (td, $J=9.9,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.75-2.61(\mathrm{~m}, 2 \mathrm{H}), 1.17$ (d, $J=6.9 \mathrm{~Hz}$, 3 H ).

## ( $\pm$ ) Methyl 2-((benzylamino)methyl)butanoate 138b

Prepared according to METHOD A starting from benzylamine $(2.18 \mathrm{~mL}, 20 \mathrm{mmol})$ and methyl 2-methylenebutanoate $(2.28 \mathrm{~g}$, $20 \mathrm{mmol})$. The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $2.88 \mathrm{~g}, 13.1 \mathrm{mmol}$, $65 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.36-7.18(\mathrm{~m}, 5 \mathrm{H}), 3.89-3.71(\mathrm{~m}, 2 \mathrm{H}), 3.69(\mathrm{~s}$, 3 H ), 2.88 (dd, $J=11.9,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.76-2.65(\mathrm{~m}, 1 \mathrm{H}), 2.51$ (dddd, $J=8.8,8.0,5.9$, $4.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.74-1.45(\mathrm{~m}, 2 \mathrm{H}), 0.91(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H})$.
( $\pm$ ) Methyl 2-benzyl-3-(benzylamino)propanoate 138c $^{351}$

Prepared according to METHOD A starting from benzylamine ( $2.18 \mathrm{~mL}, 20 \mathrm{mmol}$ ) and methyl 2-benzylacrylate ( $3.52 \mathrm{~g}, 20$ $\mathrm{mmol})$. The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $3.46 \mathrm{~g}, 12.2 \mathrm{mmol}, 61 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.41-7.16(\mathrm{~m}, 10 \mathrm{H}), 3.90-$ 3.82 (m, 2H), 3.67 (s, 3H), 3.29 (dd, $J=12.0,8.6 \mathrm{~Hz}, 4 \mathrm{H}), 2.93(\mathrm{dd}, J=12.0,6.5 \mathrm{~Hz}, 1 \mathrm{H}$.

[^121]
## ( $\pm$ ) Methyl 3-(benzylamino)-2-phenylpropanoate 138d ${ }^{352}$

Prepared according to METHOD A starting from benzylamine ( $2.18 \mathrm{~mL}, 20 \mathrm{mmol}$ ) and methyl 2-phenylacrylate ( $3.244 \mathrm{~g}, 20$ $\mathrm{mmol})$. The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $3.501 \mathrm{~g}, 13.0 \mathrm{mmol}, 65 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.41-7.16(\mathrm{~m}, 10 \mathrm{H}), 3.90$ - 3.82 (m, 1H), 3.81 (s, 2H), 3.67 (s, 3H), 3.29 (dd, $J=12.0,8.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.93 (dd, $J=$ $12.0,6.5 \mathrm{~Hz}, 1 \mathrm{H})$.
( $\pm$ ) Methyl 2-methyl-3-((naphthalen-1-ylmethyl)amino)propanoate 139a

Prepared according to METHOD A starting from 1naphthylmethylamine ( $2.93 \mathrm{~mL}, 20 \mathrm{mmol}$ ) and methyl methacrylate ( $2.13 \mathrm{~mL}, 20 \mathrm{mmol}$ ). The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $2.98 \mathrm{~g}, 11.6 \mathrm{mmol}, 58 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.17-8.11(\mathrm{~m}, 1 \mathrm{H}), 7.89-7.82(\mathrm{~m}, 1 \mathrm{H}), 7.80-7.73(\mathrm{~m}, 1 \mathrm{H}), 7.56-7.37(\mathrm{~m}$, $4 \mathrm{H}), 4.24(\mathrm{~s}, 2 \mathrm{H}), 3.66(\mathrm{~s}, 3 \mathrm{H}), 3.01(\mathrm{dd}, J=11.6,8.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.85-2.63(\mathrm{~m}, 3 \mathrm{H}), 1.19$ (d, $J=6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ).
( $\pm$ ) Methyl 3-((4-methoxyphenyl)amino)-2-methylpropanoate 140a

Prepared according to METHOD A starting from $p$-anisidine $(2.46 \mathrm{~g}, 20 \mathrm{mmol})$ and methyl methacrylate $(2.13 \mathrm{~mL}, 20$ mmol ). The title compound was purified by flash column chromatography (hexane/EtOAc, 80:20) and isolated as a yellow oil ( $2.68 \mathrm{~g}, 12.0 \mathrm{mmol}$, $60 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.85-6.72(\mathrm{~m}, 2 \mathrm{H}), 6.62-6.49(\mathrm{~m}, 2 \mathrm{H}), 3.74(\mathrm{~s}$, $3 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.37(\mathrm{dd}, J=12.9,7.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.17(\mathrm{dd}, J=12.9,5.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.86-$ $2.72(\mathrm{~m}, 1 \mathrm{H}), 1.23(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.
( $\pm$ ) Methyl 3-(isopropylamino)-2-methylpropanoate 142a ${ }^{349}$

Prepared according to METHOD B starting from isopropylamine (1.72 $\mathrm{mL}, 20 \mathrm{mmol})$ and methyl methacrylate $(2.13 \mathrm{~mL}, 20 \mathrm{mmol})$. The title compound was isolated as a yellow oil ( $2.420 \mathrm{~g}, 15.2 \mathrm{mmol}, 76 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 3.69(\mathrm{~s}, 3 \mathrm{H}), 2.91-2.82(\mathrm{~m}, 1 \mathrm{H}), 2.82-2.72(\mathrm{~m}, 1 \mathrm{H}), 2.68-$ $2.55(\mathrm{~m}, 2 \mathrm{H}), 1.17(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 1.03(\mathrm{dd}, J=6.2,1.1 \mathrm{~Hz}, 6 \mathrm{H})$.

### 6.5.2. Conjugate addition of 4 -substituted pyrrolidin-2,3-diones to methyl vinyl ketone and $\alpha^{\prime}$-oxy enones

6.5.2.1. Asymmetric addition to vinyl ketones

To a mixture of the corresponding $\alpha$-ketoamide 144 ( 1 equiv., 0.2 mmol ) and methyl vinyl ketone 150 ( $74 \mathrm{mg}, 2$ equiv., 0.4 mmol ) in dichloromethane ( 0.4 mL ) catalyst $\mathbf{C 4}(0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ was added. The mixture was stirred until consumption of the $\alpha$-ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was then quenched with $1 \mathrm{M} \mathrm{HCl}(10 \mathrm{~mL})$ and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20$ mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel to afford the expected adducts.

### 6.5.2.2. Asymmetric reaction to $\alpha$ '-oxy enones

To a mixture of the corresponding $\alpha$-ketoamide 144 or 145 ( 1 equiv., 0.2 mmol ) and the $\alpha^{\prime}$-silyloxyenone $88(74 \mathrm{mg}, 2$ equiv., 0.4 mmol$)$ in dichloromethane $(0.4 \mathrm{~mL})$ catalyst $\mathbf{C 4}(0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ was added. The mixture was stirred until consumption of the $\alpha$-ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was then quenched with $1 \mathrm{M} \mathrm{HCl}(10 \mathrm{~mL})$ and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. For the desilylation step, the reaction crude was dissolved in $\mathrm{CH}_{3} \mathrm{CN}(1 \mathrm{~mL})$ and, $\mathrm{H}_{2} \mathrm{O}(0.5 \mathrm{~mL})$ and glacial acetic acid ( 0.3 mL ) were added. The reaction mixture was stirred for 1 h at room temperature and it was quenched with $\mathrm{NaHCO}_{3}$ saturated aqueous solution $(20 \mathrm{~mL})$. The organic solvent was evaporated under reduced pressure and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel to afford the expected adducts.

### 6.5.2.3. Racemic reactions

To a mixture of the corresponding $\alpha$-ketoamide $\mathbf{1 4 4}$ or $\mathbf{1 4 5}$ ( 1 equiv., 0.2 mmol ) and enone $\mathbf{1 5 0}(21 \mathrm{mg}, 1.5 \mathrm{eq} ., 0.3 \mathrm{mmol})$ or $\alpha^{\prime}$-hydroxy enone $\mathbf{1 8}(34 \mathrm{mg}, 1.5 \mathrm{eq} ., 0.3$
mmol ) in dichloromethane ( 0.4 mL ) TEA ( $56 \mu \mathrm{~L}, 0.4 \mathrm{mmol}, 2$ equiv.) was added at room temperature. The mixture was stirred at the same temperature, until consumption of the $\alpha$ ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was then quenched with 1 M $\mathrm{HCl}(10 \mathrm{~mL})$ and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 3 x 20 mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel to afford the expected adducts.

### 6.5.2.4. Characterization data for compounds 151, 152 and 153

## (R)-1-Benzyl-4-methyl-4-(3-oxobutyl)pyrrolidine-2,3-dione 151a

The title compound was prepared from 1-benzyl-3-hydroxy-4-methyl1 H -pyrrol-2( 5 H )-one 144a ( $41 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate 80/20) to give the title compound as a white foam ( $41 \mathrm{mg}, 0.15 \mathrm{mmol}, 75 \%) .[\alpha]_{\mathrm{D}}{ }^{23}=-1.0^{\circ}(\mathrm{c}=1.75,92 \% \mathrm{ee}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $7.40-7.18(\mathrm{~m}, 5 \mathrm{H}), 4.71(\mathrm{~d}, J=14.3 \mathrm{~Hz}, 1 \mathrm{H})$, $4.61(\mathrm{~d}, J=14.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.29(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.20(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.33$ (dd, $J$ $=8.7,6.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.05(\mathrm{~s}, 3 \mathrm{H}), 1.86-1.73(\mathrm{~m}, 2 \mathrm{H}), 1.15(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 207.0,203.6,159.2,134.6,129.2,128.7,128.6,54.0,48.6,42.5,37.8,30.9$, 30.1, 21.8. UPLC-DAD-QTOF: $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{NO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 274.1443, found: 274.1453. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak OD-H, hexane/isopropanol 80/20, flow rate $=0.7 \mathrm{~mL} / \mathrm{min}$, retention times: 38.1 min (minor.) and 41.3 min (major.)).

## (S)-1,4-Dibenzyl-4-(3-oxobutyl)pyrrolidine-2,3-dione 151c

The title compound was prepared from 1,4-dibenzyl-3-hydroxy-1H-pyrrol-2(5H)-one 144 c ( $59 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate 80/20) to give the title compound as a white foam $(59 \mathrm{mg}, 0.17 \mathrm{mmol}, 84 \%) .[\alpha]_{\mathrm{D}}^{23}=-15.3^{\circ}$ $\left(\mathrm{c}=2.0,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.32-7.24(\mathrm{~m}, 3 \mathrm{H}), 7.24-7.15$ $(\mathrm{m}, 3 \mathrm{H}), 7.05-6.98(\mathrm{~m}, 2 \mathrm{H}), 6.95-6.89(\mathrm{~m}, 2 \mathrm{H}), 4.50(\mathrm{~s}, 2 \mathrm{H}), 3.48(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 1 \mathrm{H})$, $3.17-3.06(\mathrm{~m}, 2 \mathrm{H}), 2.64(\mathrm{~d}, J=13.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.49-2.22(\mathrm{~m}, 2 \mathrm{H}), 2.08(\mathrm{~s}, 3 \mathrm{H}), 2.04-$ $1.80(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 206.7$, 204.4, 159.1, 135.0, 134.4, 129.9, 129.2, 128.9, 128.4, 128.4, 127.5, 49.8, 48.4, 46.9, 41.9, 37.6, 30.8, 30.1. UPLC-DAD-

QTOF: $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{NO}_{3}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 350.1756 , found: 350.1769 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak OD-H, hexane/isopropanol 50/50, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 21.5 min (minor.) and 40.4 min (major.)).

## 1-Benzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-methylpyrrolidine-2,3-dione 152a

The title compound was prepared from 1-benzyl-3-hydroxy-4-methyl-1H-pyrrol-2( $5 H$ )-one $\mathbf{1 4 4 a}(41 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate 80/20) to give the title compound as a white foam ( $53 \mathrm{mg}, 0.17 \mathrm{mmol}, 84 \%$ ). $[\alpha]_{\mathrm{D}}{ }^{23}=+18.9^{\circ}$ ( $\mathrm{c}=1.15,90 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.51-7.22(\mathrm{~m}, 5 \mathrm{H}), 4.77(\mathrm{~d}, J$ $=14.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.61(\mathrm{~d}, J=14.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.34(\mathrm{~s}, 1 \mathrm{H}), 3.31(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.24(\mathrm{~d}$, $J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.53-2.43(\mathrm{~m}, 2 \mathrm{H}), 1.92-1.82(\mathrm{~m}, 2 \mathrm{H}), 1.32(\mathrm{~s}, 3 \mathrm{H}), 1.28(\mathrm{~s}, 3 \mathrm{H})$, $1.20(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.6,203.5,159.2,134.6,129.3,128.7$, 128.6, 76.6, 53.9, 48.6, 42.5, 31.1, 30.2, 26.7, 21.9. UPLC-DAD-QTOF: $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NO}_{4}$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 318.1705 , found: 318.1705 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AY-H, hexane/isopropanol 40/60, flow rate= 0.7 $\mathrm{mL} / \mathrm{min}$, retention times: 23.1 min (major.) and 27.9 min (minor.)).

## 1,4-Dibenzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)pyrrolidine-2,3-dione 152c

The title compound was prepared from 1,4-dibenzyl-3-hydroxy$1 H$-pyrrol-2 $(5 H)$-one $\mathbf{1 4 4 b}$ ( $59 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $80 / 20$ ) to give the title compound as a white foam ( $55 \mathrm{mg}, 0.14 \mathrm{mmol}, 70 \%$ ). $[\alpha]_{\mathrm{D}}{ }^{23}=+17.6^{\circ}\left(\mathrm{c}=1.45,84 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.34-7.16(\mathrm{~m}$, $7 \mathrm{H}), 7.08-6.90(\mathrm{~m}, 3 \mathrm{H}), 4.54(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.50(\mathrm{~d}, J$ $=11.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.30(\mathrm{~s}, 1 \mathrm{H}), 3.17-3.06(\mathrm{~m}, 2 \mathrm{H}), 2.66(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.63-2.34$ (m, 2H), 2.04 (ddd, $J=14.2,9.9,5.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.90(\mathrm{ddd}, J=14.3,10.3,5.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.33$ $(\mathrm{s}, 3 \mathrm{H}), 1.28(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.3,204.3,159.1,134.9,134.4$, 123.0, 129.3, 129.0, 128.5, 128.5, 127.7, 76.7, 49.9, 48.6, 46.9, 42.0, 31.0, 30.0, 26.8. UPLC-DAD-QTOF: $\mathrm{C}_{24} \mathrm{H}_{28} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 394.2018, found: 394.2007. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol 70/30, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}$, retention times: 25.9 min (minor.) and 31.2 min (major.)).

## 1-Benzyl-4-(4-hydroxy-4-methyl-3-oxopentyl)-4-phenylpyrrolidine-2,3-dione 152d

The title compound was prepared from 1-benzyl-3-hydroxy-4-phenyl-1H-pyrrol-2( $5 H$ )-one $\mathbf{1 4 4 d}(53 \mathrm{mg}, 0.2 \mathrm{mmol})$ following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $80 / 20$ ) to give the title compound as a white foam ( $45 \mathrm{mg}, 0.12$ $\mathrm{mmol}, 60 \%) \cdot[\alpha]_{\mathrm{D}}{ }^{23}=-0.14^{\circ}\left(\mathrm{c}=1.25,80 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.47-6.94(\mathrm{~m}, 10 \mathrm{H}), 4.71(\mathrm{q}, J=14.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.61(\mathrm{~d}, J=$ $11.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.40(\mathrm{~s}, 1 \mathrm{H}), 2.64-2.45(\mathrm{~m}, 1 \mathrm{H}), 2.36-2.20(\mathrm{~m}, 2 \mathrm{H}), 1.22(\mathrm{~s}, 3 \mathrm{H}), 1.17(\mathrm{~s}$, 3H). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.4,200.4,159.0,137.4,134.4,129.4,129.3,128.8$, 128.8, 128.2, 126.5, 76.5, 54.5, 50.5, 48.7, 31.8, 30.5, 26.7, 26.6. UPLC-DAD-QTOF: $\mathrm{C}_{23} \mathrm{H}_{26} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 380.1862 , found: 380.1870 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AY-H, hexane/isopropanol 40/60, flow rate $=0.6 \mathrm{~mL} / \mathrm{min}$, retention times: 12.7 min (minor.) and 28.3 min (major.)).

## 4-(4-Hydroxy-4-methyl-3-oxopentyl)-4-methyl-1-(naphthalen-1-ylmethyl)pyrrolidine-2,3-dione 153a

The title compound was prepared from 3-hydroxy-4-methyl-1-(naphthalen-1-ylmethyl)-1 H -pyrrol-2 $(5 \mathrm{H}$ )-one $\mathbf{1 4 5 a}$ ( $51 \mathrm{mg}, 0.2$ mmol ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $80 / 20$ ) to give the title compound as a white foam ( $63 \mathrm{mg}, 0.17 \mathrm{mmol}, 86 \%$ ). $[\alpha]_{\mathrm{D}}{ }^{23}=+$ $18.3^{\circ}\left(\mathrm{c}=1.6,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.19-7.97(\mathrm{~m}, 1 \mathrm{H}), 7.96$ $-7.76(\mathrm{~m}, 2 \mathrm{H}), 7.67-7.36(\mathrm{~m}, 4 \mathrm{H}), 5.31(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.98(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H})$, $3.32(\mathrm{~s}, 1 \mathrm{H}), 3.19-3.04(\mathrm{~m}, 2 \mathrm{H}), 2.40-2.09(\mathrm{~m}, 2 \mathrm{H}), 1.85-1.61(\mathrm{~m}, 2 \mathrm{H}), 1.16(\mathrm{~s}, 3 \mathrm{H})$, $1.09(\mathrm{~s}, 3 \mathrm{H}), 1.07(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.2$, 203.6, 158.8, 134.1, $131.5,130.0,129.9,129.1,128.9,127.6,126.7,125.3,123.5,76.5,53.6,46.9,42.5,31.2$, 23.0, 26.6, 22.2. UPLC-DAD-QTOF: $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 368.1862, found: 368.1861. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AY-H, hexane/ethanol 50/50, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 13.6 min (minor.) and 15.7 min (major.)).

### 6.5.3. $\alpha$-Amination of pyrrolidin-2,3-diones with di-tert-butyl azodicarboxylate

### 6.5.3.1. Asymmetric reaction

To a mixture of the corresponding $\alpha$-ketoamide ( $0.2 \mathrm{mmol}, 1$ equiv.) and catalyst C60 ( $16 \mathrm{mg}, 0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) in dichloromethane ( 0.4 mL ), di-tert-butyl azodicarboxylate 38 ( $69 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) was added at $-40^{\circ} \mathrm{C}$. The resulting mixture was stirred at the same temperature until consumption of the $\alpha$-ketoamide (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The reaction mixture was directly purified by flash column chromatography on silica gel (eluent hexane/ ethyl acetate 80/20) without previous workup to afford the expected adducts.

### 6.5.3.2. Racemic reaction

Racemic reactions were conducted following the procedure for the asymmetric version, but using as catalyst TEA (2 equiv.) and carrying out the reaction at room temperature.

### 6.5.3.3. Characterization data for compounds $\mathbf{1 5 4 - 1 5 7}$

## Di-tert-butyl 1-(1-benzyl-3-methyl-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2dicarboxylate 154a

The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 85/15, flow rate $=0.7 \mathrm{~mL} / \mathrm{min}$, retention times: 8.9 min (major.) and 13.3 min (minor.)).

## Di-tert-butyl 1-(1,3-dibenzyl-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2-dicarboxylate 154c

Prepared according to the general procedure starting from 1,4-dibenzyl-3-hydroxy-1H-pyrrol-2(5H)-one $\mathbf{1 4 4 c}$ ( $59 \mathrm{mg}, 0.2 \mathrm{mmol}$ ). The title compound was isolated as a white foam ( $88 \mathrm{mg}, 0.17 \mathrm{mmol}$, $86 \%) .[\alpha]_{\mathrm{D}}{ }^{24}=+68.0^{\circ}\left(\mathrm{c}=1.08,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.31-7.06(\mathrm{~m}, 6 \mathrm{H}), 7.03-6.79(\mathrm{~m}, 4 \mathrm{H}), 6.66(\mathrm{~s}, 1 \mathrm{H}), 4.39-$ $4.12(\mathrm{~m}, 2 \mathrm{H}), 3.87(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.56(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.12(\mathrm{~d}, J=12.7 \mathrm{~Hz}$, $1 \mathrm{H}), 2.86(\mathrm{~d}, J=12.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.47(\mathrm{~s}, 9 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 196.7, 159.0, 156.0, 154.6, 134.4, 131.7, 130.3, 128.9, 128.8, 128.1, 127.9, 127.7, 83.7, 82.3, 62.2, 51.8, 47.8, 41.0, 28.3, 28.1. UPLC-DAD-QTOF: $\mathrm{C}_{28} \mathrm{H}_{35} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$ calcd.: 532.2424, found: 532.2426. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol $85 / 15$, flow rate $=0.7 \mathrm{~mL} / \mathrm{min}$, retention times: 31.6 min (minor.) and 36.1 min (major.)).

## Di-tert-butyl 1-(1-benzyl-4,5-dioxo-3-phenylpyrrolidin-3-yl)hydrazine-1,2dicarboxylate 154d

Prepared according to the general procedure starting from 1-benzyl-3-hydroxy-4-phenyl-1 $H$-pyrrol-2( $5 H$ )-one 144d ( $53 \mathrm{mg}, 0.2 \mathrm{mmol}$ ). The title compound was isolated as a white foam ( $78 \mathrm{mg}, 0.15 \mathrm{mmol}$, $75 \%) .[\alpha]_{\mathrm{D}}{ }^{24}=-8.8^{\circ}\left(\mathrm{c}=1.05,96 \% \mathrm{ee}, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.40-7.15(\mathrm{~m}, 10 \mathrm{H}), 6.26(\mathrm{~s}, 1 \mathrm{H}), 4.98(\mathrm{~d}, J=14.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.49(\mathrm{~d}, J=14.2$ $\mathrm{Hz}, 1 \mathrm{H}), 4.32(\mathrm{~d}, J=10.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.15(\mathrm{~d}, J=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.40(\mathrm{~s}, 9 \mathrm{H}), 1.29(\mathrm{~s}, 9 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 190.8,158.4,155.3,134.7,131.8,129.4,129.1,129.0$, 128.6, 128.2, 128.0, 125.4, 83.7, 81.9, 67.5, 51.0, 48.2, 28.1. UPLC-DAD-QTOF: $\mathrm{C}_{27} \mathrm{H}_{33} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 518.2267, found: 518.2266. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol/ethanol, 80/19/1, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 14.5 min (minor.) and 21.2 min (major.)).

## Di-tert-butyl 1-(3-methyl-1-(naphthalen-1-ylmethyl)-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2-dicarboxylate 155a

Prepared according to the general procedure starting from 3-hydroxy-4-methyl-1-(naphthalen-1-ylmethyl)-1 H -pyrrol-2(5H)-one 145a (51 $\mathrm{mg}, 0.2 \mathrm{mmol}$ ). The title compound was isolated as a white foam ( 94 $\mathrm{mg}, 0.19 \mathrm{mmol}, 97 \%) .[\alpha]_{\mathrm{D}}{ }^{25}=+56.8^{\circ}\left(\mathrm{c}=1.06,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.02-7.72(\mathrm{~m}, 2 \mathrm{H}), 7.54-7.30(\mathrm{~m}, 5 \mathrm{H})$, 6.63 (s, 1H), 5.54 (d, $J=14.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.71$ (d, $J=14.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.88$ (d, $J=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{~d}, J=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.38(\mathrm{~s}, 9 \mathrm{H}), 1.33(\mathrm{~s}, 9 \mathrm{H}), 1.13(\mathrm{~s}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 195.4,158.3,155.8,154.5,133.9,131.4,123.0,129.3$, $128.8,127.9,127.0,126.3,125.3,123.5,83.4,82.0,60.1,54.1,46.4,28.2,28.0,21.0$. UPLC-DAD-QTOF: $\mathrm{C}_{26} \mathrm{H}_{33} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 506.2267, found: 506.2270. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 30.9 min (major.) and 45.7 min (minor.)).

## Di-tert-butyl 1-(1-(4-methoxyphenyl)-3-methyl-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2-dicarboxylate 156a

Prepared according to the general procedure starting from 3-hydroxy-1-(4-methoxyphenyl)-4-methyl-1 H -pyrrol-2(5H)-one 146a ( $44 \mathrm{mg}, 0.2$ mmol ). The title compound was isolated as a white foam ( $85 \mathrm{mg}, 0.19$ $\mathrm{mmol}, 95 \%) .[\alpha]_{\mathrm{D}}{ }^{25}=+44.4^{\circ}\left(\mathrm{c}=1.00,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.79(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.96(\mathrm{~d}, J=8.9 \mathrm{~Hz}, 2 \mathrm{H}), 6.55$
$(\mathrm{s}, 1 \mathrm{H}), 4.48(\mathrm{~d}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.77-3.85(\mathrm{~m}, 4 \mathrm{H}), 1.40-1.51(\mathrm{~m}, 21 \mathrm{H}){ }^{13}{ }^{3} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 194.9,158.0,156.9,156.1,154.5,132.0,121.5,114.3,83.5,82.2$, 60.0, 55.9, 55.6, 28.3, 28.10, 21.5. UPLC-DAD-QTOF: $\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{~N}_{3} \mathrm{O}_{7} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 472.2060, found: 472.2068. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol 80/20, flow rate $=0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 12.3 min (minor.) and 15.5 min (major.)).

## Di-tert-butyl 1-(1-isopropyl-3-methyl-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2dicarboxylate 157a

Prepared according to the general procedure starting from methyl 3-(isopropylamino)-2-methylpropanoate $\mathbf{1 4 7 a}$ ( $31 \mathrm{mg}, 0.2 \mathrm{mmol}$ ). The title compound was isolated as a white foam ( $60 \mathrm{mg}, 0.16 \mathrm{mmol}$, $80 \%) .[\alpha]_{\mathrm{D}}{ }^{23}=+50.1^{\circ}\left(\mathrm{c}=1.8,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 6.60(\mathrm{~s}, 1 \mathrm{H}), 4.73-4.48(\mathrm{~m}, 1 \mathrm{H}), 3.91(\mathrm{~d}, J=11.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.34(\mathrm{~d}, J=12.7$ $\mathrm{Hz}, 1 \mathrm{H}), 1.47(\mathrm{~s}, 9 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}), 1.27-1.13(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta$ 196.2, 158.0, 156.1, 154.4, 83.3, 82.2, 60.6, 49.9, 44.4, 28.3, 21.3, 19.3. UPLC-DAD-QTOF: $\mathrm{C}_{18} \mathrm{H}_{31} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{Na} \quad[\mathrm{M}+\mathrm{Na}]^{+}$calcd.: 408.2111, found: 408.2114. The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol 90/10, flow rate $=0.7 \mathrm{~mL} / \mathrm{min}$, retention times: 10.8 min (minor.) and 13.0 min (major.)).
6.5.4. Michael addition of pyrrolidin-2,3-diones to $\quad$ 1,1-
bis(phenylsulfonyl)ethylene
6.5.4.1. Asymmetric reaction

To a mixture of the $\alpha$-ketoamide $\mathbf{1 4 4 a}$ ( $41 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) and $\mathbf{C 4}$ (13 $\mathrm{mg}, 0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) in dichloromethane ( 0.4 mL ), bis(phenylsulfonyl)ethylene 158 ( $93 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) was added at $-20^{\circ} \mathrm{C}$. The resulting mixture was stirred until consumption of the $\alpha$-ketoamide and $m \mathrm{CPBA}(75 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) was in situ slowly added at the same temperature. After reaction completion ( 1 h ) benzylamine ( $26 \mu \mathrm{~L}, 0.24 \mathrm{mmol}, 1.2$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL}$ ) was added dropwise and the mixture was stirred at $-20^{\circ} \mathrm{C}$ for 16 h . The reaction was quenched with aqueous $10 \% \mathrm{NaHSO}_{3}$
and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. All organic phases were washed with NaOH 1 N , dried over $\mathrm{MgSO}_{4}$ and evaporated under reduced pressure.

### 6.5.4.2. Racemic reaction

Racemic reactions were conducted following the procedure for the asymmetric version, but in the first step using as catalyst TEA (2 equiv.) and carrying out the reaction at room temperature.

### 6.5.4.3. Characterization data for compound 161

## $N$-benzyl-2-((benzylamino)methyl)-2-methyl-4,4-bis(phenylsulfonyl)butanamide 161

Prepared according to the general procedure starting from 1-benzyl-3-hydroxy-4-methyl-1H-pyrrol-2(5H)-one 144a (41 mg, 0.2 mmol ). The title compound was isolated as a white foam $(89 \mathrm{mg}, 0.15 \mathrm{mmol}, 77 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.30$ $(\mathrm{s}, 1 \mathrm{H}), 7.99-7.86(\mathrm{~m}, 2 \mathrm{H}), 7.88-7.79(\mathrm{~m}, 2 \mathrm{H}), 7.67-7.53(\mathrm{~m}, 2 \mathrm{H}), 7.45(\mathrm{td}, J=7.7$, $7.2,1.6 \mathrm{~Hz}, 4 \mathrm{H}), 7.37-7.15(\mathrm{~m}, 8 \mathrm{H}), 7.04-6.94(\mathrm{~m}, 2 \mathrm{H}), 5.57(\mathrm{~s}, 1 \mathrm{H}), 4.52-4.28(\mathrm{~m}$, $2 \mathrm{H}), 3.81-3.52(\mathrm{~m}, 2 \mathrm{H}), 2.90-2.66(\mathrm{~m}, 3 \mathrm{H}), 2.35-2.15(\mathrm{~m}, 1 \mathrm{H}), 1.02(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.1,138.8,138.8,138.4,137.8,135.2,134.6,134.16,130.0$, 129.9, 129.7, 129.6, 129.5, 129.3, 129.2, 129.1, 128.9, 128.8, 128.7, 128.5, 128.4, 127.5, $78.6,77.7,77.2,76.8,76.8,56.7,54.6,44.2,43.3,30.6,22.6$. UPLC-DAD-QTOF: $\mathrm{C}_{32} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}_{2}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 591.1987 , found: 591.1982 . The enantiomeric purity was determined by HPLC analysis (Daicel Chiralpak IA hexane/isopropanol 70/30, flow rate= $0.5 \mathrm{~mL} / \mathrm{min}$, retention times: 26.9 min (major.) and 31.1 min (minor.)).

### 6.5.5. Elaboration of the adducts

6.5.5.1. To carboxylic acid $\mathbf{1 6 2}$ and ester $\mathbf{1 6 3}$

A suspension of sodium periodate $\mathrm{NaIO}_{4}(342 \mathrm{mg}, 1.6 \mathrm{mmol})$ in water $(0.8 \mathrm{~mL})$ was added to a solution of the $\alpha^{\prime}$-hydroxy ketone $\mathbf{1 5 3 a}(0.2 \mathrm{mmol})$ in methanol ( 1 mL ). The mixture was stirred at room temperature until the reaction was complete (monitored by TCL, 16 h ). Then the solvent was removed under reduced pressure. Water ( 4.5 mL ) was added to the crude product and the resulting mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $3 \times 6$ mL ). The combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated to afford the corresponding carboxylic acid. For the obtention of the ester, the carboxylic acid was dissolved in $\mathrm{MeOH}(1 \mathrm{~mL} / \mathrm{mmol})$ and $\mathrm{TMSCHN}_{2}\left(2 \mathrm{M}\right.$ in $\mathrm{Et}_{2} \mathrm{O}, 2$ equiv.) was added dropwise. The reaction mixture was stirred for 5 h and then all organic solvents were evaporated under reduced pressure. The resulting crude was purified by flash column chromatography to afford the desired methyl ester.

## 3-(3-Methyl-1-(naphthalen-1-ylmethyl)-4,5-dioxopyrrolidin-3-yl)propanoic acid 162

The title compound was prepared from 4-(4-hydroxy-4methyl-3-oxopentyl)-4-methyl-1-(naphthalen-1-ylmethyl)pyrrolidine-2,3-dione 153a ( $74 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $50 / 50$ ) to give the title compound as a white foam ( $55 \mathrm{mg}, 0.17 \mathrm{mmol}, 86 \%$ ) $[\alpha]_{\mathrm{D}}{ }^{23}=+$ $10.2^{\circ}\left(\mathrm{c}=1.2, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.21-7.83(\mathrm{~m}, 3 \mathrm{H}), 7.68-7.42$ $(\mathrm{m}, 4 \mathrm{H}), 5.18(\mathrm{q}, J=14.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.21(\mathrm{~d}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{~d}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H})$, $2.28-2.13(\mathrm{~m}, 2 \mathrm{H}), 1.91-1.68(\mathrm{~m}, 2 \mathrm{H}), 1.08(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 203.0, 176.9, 159.1, 134.1, 131.5, 123.0, 129.8, 129.1, 128.7, 127.5, 126.7, 125.3, 123.5, 53.5, 47.0, 42.7, 31.6, 28.7, 21.8. UPLC-DAD-QTOF: $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 326.1392, found: 326.1401.

Methyl 3-(3-methyl-1-(naphthalen-1-ylmethyl)-4,5-dioxopyrrolidin-3-yl)propanoate 163

The title compound was prepared from 3-(3-methyl-1-(naphthalen1 -ylmethyl)-4,5-dioxopyrrolidin-3-yl)propanoic acid 162 ( 55 mg , 0.17 mmol ) following the general procedure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate 80/20) to give the title compound as a white foam ( $56 \mathrm{mg}, 0.17 \mathrm{mmol}, 99 \%$ ). $[\alpha]_{\mathrm{D}}{ }^{25}=+10.9^{\circ}$ (c=0.7, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.18-7.78(\mathrm{~m}, 3 \mathrm{H}), 7.69-7.43(\mathrm{~m}, 4 \mathrm{H}), 5.16(\mathrm{~s}$, 2 H ), 3.57 ( $\mathrm{s}, 3 \mathrm{H}$ ), 3.16 (d, $J=11.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.03 (d, $J=11.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.15-2.04$ (m, $2 \mathrm{H}), 1.84-1.68(\mathrm{~m}, 2 \mathrm{H}), 1.06(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 203.2,172.9,158.9$,
134.1, 131.5, 130.0, 129.9, 129.1, 128.8, 127.5, 126.7, 125.3, 123.5, 53.4, 52.0, 47.0, 42.7, 31.9, 28.8, 21.9. UPLC-DAD-QTOF: $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}$calcd.: 340.1549 , found: 340.1541 .
6.5.5.2. To NCAs and ring opening with amines

$\mathbf{1}^{\text {st }}$ step: To a solution of the Michael adduct ( $0.2 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1 mL ), $m$ CPBA ( $67 \mathrm{mg}, 0.3 \mathrm{mmol}, 1.5$ equiv.) was slowly added at $-20^{\circ} \mathrm{C}$. The reaction mixture was stirred at $-20^{\circ} \mathrm{C}$ or warmed up to room temperature. The reaction was quenched with aqueous $10 \% \mathrm{NaHSO}_{3}$ and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. All organic phases were combined, washed with NaOH 1 N , dried over $\mathrm{MgSO}_{4}$ and evaporated under reduced pressure to afford the corresponding NCAs.

## (R)-5-(4-Hydroxy-4-methyl-3-oxopentyl)-5-methyl-3-(naphthalen-1-ylmethyl)-1,3-oxazinane-2,6-dione 164

The title compound was prepared starting from 4-(4-hydroxy-4-methyl-3-oxopentyl)-4-methyl-1-(naphthalen-1-ylmethyl)pyrroli-dine-2,3-dione 153a ( $73 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and following the general procedure at $-20^{\circ} \mathrm{C}$ for 1 h . The crude material was pure enough for the next step ( $77 \mathrm{mg}, 0.2 \mathrm{mmol}, 100 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.17-8.05(\mathrm{~m}, 1 \mathrm{H}), 8.03-7.84(\mathrm{~m}, 2 \mathrm{H}), 7.67-7.35$ $(\mathrm{m}, 4 \mathrm{H}), 5.15(\mathrm{~d}, J=14.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.08(\mathrm{~d}, J=14.5 \mathrm{~Hz}, 1 \mathrm{H})$, $3.04-2.92$ (m, 2H), 2.41 (ddd, $J=18.1,9.3,5.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.26$ (ddd, $J=18.1,9.1,5.8$ $\mathrm{Hz}, 1 \mathrm{H}), 1.79$ (ddd, $J=14.9,9.1,6.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.50(\mathrm{ddd}, J=14.7,9.2,5.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.25$ (s, 3H), $1.24(\mathrm{~s}, 3 \mathrm{H}), 0.99(\mathrm{~s}, 3 \mathrm{H})$.

## (R)-Di-tert-butyl 1-(3-benzyl-5-methyl-2,6-dioxo-1,3-oxazinan-5-yl)hydrazine-1,2dicarboxylate 168

The title compound was prepared starting from di-tert-butyl 1-(1-benzyl-3-methyl-4,5-dioxopyrrolidin-3-yl)hydrazine-1,2-dicarboxylate $\mathbf{1 5 4 a}(87 \mathrm{mg}, 0.2 \mathrm{mmol})$ and following the general procedure adding $m$-CPBA at $-20^{\circ} \mathrm{C}$, warming up slowly and stirring at room temperature for 6 h . The crude material was pure enough for the next
step ( $90 \mathrm{mg}, 0.2 \mathrm{mmol}, 100 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.54-7.09(\mathrm{~m}, 5 \mathrm{H}), 4.95-$ $4.72(\mathrm{~m}, 1 \mathrm{H}), 4.33(\mathrm{dd}, J=16.1,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.19-3.81(\mathrm{~m}, 1 \mathrm{H}), 3.53(\mathrm{~d}, J=13.6 \mathrm{~Hz}$, $1 \mathrm{H}), 3.22-3.01(\mathrm{~m}, 1 \mathrm{H}), 1.45(\mathrm{~s}, 9 \mathrm{H}), 1.42(\mathrm{~s}, 9 \mathrm{H}), 1.36(\mathrm{~s}, 3 \mathrm{H})$.

2nd step: The corresponding amino ester hydrochloride ( 1.1 equiv.) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $2 \mathrm{~mL} / \mathrm{mmol}$ ) and TEA ( 2 equiv.) was added. The mixture was stirred for 30 min and then it was cooled to $-20^{\circ} \mathrm{C}$. At this temperature a solution of the crude NCA ( $0.2 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL} / \mathrm{mmol})$ was added. The reaction mixture was warmed to room temperature and stirred overnight. The reaction was quenched with HCl 1 N , extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed with $\mathrm{NaHCO}_{3}$, dried over $\mathrm{MgSO}_{4}$ and the organic layer was evaporated under reduced pressure.

## (S)-tert-Butyl 2-((R)-6-hydroxy-2,6-dimethyl-2-(((naphthalen-1-ylmethyl)amino) methyl)-5-oxoheptanamido)-3-phenylpropanoate 165

The title compound was prepared from ( $R$ )-5-(4-hydroxy-4-methyl-3-oxopentyl)-5-methyl-3-(naphthalen-1-ylme-thyl)-1,3-oxazinane-2,6-dione 164 ( $77 \mathrm{mg}, 0.2 \mathrm{mmol}$ ), (S)-tert-butyl 2-amino-3-phenylpropanoate ( $53 \mathrm{mg}, 0.24$ mmol ) and triethylamine ( $56 \mu \mathrm{~L}, 0.4 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate 80/20) to give the title compound as a white foam ( $86 \mathrm{mg}, 0.15 \mathrm{mmol}, 77 \%$ yield). $[\alpha]_{\mathrm{D}}{ }^{23}=+1.8^{\circ}(\mathrm{c}=0.8$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.93(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.12(\mathrm{dt}, J=7.4,1.4$ $\mathrm{Hz}, 1 \mathrm{H}), 7.94-7.75(\mathrm{~m}, 2 \mathrm{H}), 7.56-7.34(\mathrm{~m}, 5 \mathrm{H}), 7.12-7.03(\mathrm{~m}, 2 \mathrm{H}), 6.89-6.79(\mathrm{~m}$, $2 \mathrm{H}), 4.70-4.59(\mathrm{~m}, 1 \mathrm{H}), 4.32(\mathrm{~d}, J=13.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{~d}, J=13.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.98(\mathrm{dd}, J$ $=13.8,5.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.76(\mathrm{~d}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.70(\mathrm{~d}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.54(\mathrm{dd}, J=$ $13.8,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.43-2.15(\mathrm{~m}, 3 \mathrm{H}), 1.72-1.61(\mathrm{~m}, 2 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H}), 1.26(\mathrm{~s}, 3 \mathrm{H})$, $1.23(\mathrm{~s}, 3 \mathrm{H}), 1.09(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 214.7,176.0,171.3,137.2,134.2$, $132.0,129.4,129.1,128.5,128.3,127.0,126.8,126.7$, 126.0, 125.6, 123.9, 81.8, 76.5, 56.6, 53.5, 52.3, 44.2, 38.0, 31.8, 28.2, 26.7, 26.6, 22.1. UPLC-DAD-QTOF: $\mathrm{C}_{34} \mathrm{H}_{45} \mathrm{~N}_{2} \mathrm{O}_{5}$ $[\mathrm{M}+\mathrm{H}]+$ calcd.: 561.3328, found: 561.3331.

## (R)-Di-tert-butyl 1-(3-(benzylamino)-1-((2-ethoxy-2-oxoethyl)amino)-2-methyl-1-oxopropan-2-yl)hydrazine-1,2-dicarboxylate 169

The title compound was prepared from ( $R$ )-di-tert-butyl 1-(3-benzyl-5-methyl-2,6-dioxo-1,3-oxazinan-5-yl)hydrazine-1,2dicarboxylate 168 ( $90 \mathrm{mg}, 0.2 \mathrm{mmol}$ ), ethyl 2-amino acetate ( $25 \mathrm{mg}, 0.24 \mathrm{mmol}$ ) and triethylamine ( $56 \mu \mathrm{~L}, 0.4 \mathrm{mmol}$ ) following the general procedure. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $50 / 50$ ) to give the title compound as a white foam ( $76 \mathrm{mg}, 0.15 \mathrm{mmol}, 75 \%$ yield). $[\alpha]_{\mathrm{D}}{ }^{23}=+15.5^{\circ}\left(\mathrm{c}=0.75, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.50(\mathrm{~s}, 1 \mathrm{H}), 7.38-7.15(\mathrm{~m}, 5 \mathrm{H}), 6.69(\mathrm{~d}, J=32.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.25-$ 4.07 (m, 3H), $3.88-3.75(\mathrm{~m}, 3 \mathrm{H}), 3.45-3.15(\mathrm{~m}, 1 \mathrm{H}), 3.01(\mathrm{dd}, J=25.7,12.6 \mathrm{~Hz}, 1 \mathrm{H})$, $1.90(\mathrm{~s}, 1 \mathrm{H}), 1.49(\mathrm{~d}, J=5.0 \mathrm{~Hz}, 9 \mathrm{H}), 1.46(\mathrm{~s}, 3 \mathrm{H}), 1.39(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 9 \mathrm{H}), 1.30-1.21$ $(\mathrm{m}, 3 \mathrm{H}){ }^{13}{ }^{3} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 175.1,169.9,157.7,154.0,140.3,128.6,128.3$, 127.3, 82.4, 82.1, 81.8, 67.3, 61.2, 54.8, 41.6, 28.4, 28.3, 22.6, 14.3. ### 6.5.5.3. To dicarboxylic acid 167

(S)-tert-Butyl 2-((R)-2-(((tert-butoxycarbonyl)amino)methyl)-6-hydroxy-2,6-dimethyl-5-oxoheptanamido)-3-phenylpropanoate 166

To a solution of (S)-tert-butyl 2-((R)-6-hydroxy-2,6-dimethyl-2-(((naphthalen-1-ylmethyl)amino)methyl)-5-oxoheptanamido)-3-phenylpropanoate $\mathbf{1 6 5}$ ( $151 \mathrm{mg}, 0.3$ mmol, 1 equiv.) and di-tert-butyl dicarbonate ( 130 mg , $0.6 \mathrm{mmol}, 2$ equiv.) in EtOAc ( $1 \mathrm{~mL}, 5 \mathrm{~mL} / \mathrm{mmol}$ ) $\mathrm{Pd} / \mathrm{C}$ ( $30 \mathrm{mg}, 20 \mathrm{~mol} \%$ on weight) was added and the resulting
mixture was stirred under hydrogen for 16 h . Then resulting mixture was filtered through celite and all volatiles were evaporated under reduced pressure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $50 / 50$ ) to give the title compound as a white foam ( $32 \mathrm{mg}, 0.06 \mathrm{mmol}, 21 \%$ yield). $[\alpha]_{D}{ }^{23}$ $=+10.1^{\circ}\left(\mathrm{c}=0.75, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.32-7.21(\mathrm{~m}, 3 \mathrm{H}), 7.15-$ $7.09(\mathrm{~m}, 2 \mathrm{H}), 6.03(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.78-4.65(\mathrm{~m}, 1 \mathrm{H}), 3.91(\mathrm{t}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.84$ $-3.67(\mathrm{~m}, 1 \mathrm{H}), 3.44-3.35(\mathrm{~m}, 1 \mathrm{H}), 3.19-3.00(\mathrm{~m}, 2 \mathrm{H}), 2.26-2.08(\mathrm{~m}, 1 \mathrm{H}), 1.77-$ $1.62(\mathrm{~m}, 2 \mathrm{H}), 1.57(\mathrm{~s}, 3 \mathrm{H}), 1.47(\mathrm{~s}, 9 \mathrm{H}), 1.43(\mathrm{~s}, 9 \mathrm{H}), 1.19(\mathrm{~s}, 3 \mathrm{H}), 1.16(\mathrm{~s}, 3 \mathrm{H}){ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 221.4,176.0,171.0,136.4,129.7,128.6,127.2,82.7,80.7,75.6$, $60.5,53.4,47.5,43.0,38.1,31.6,28.6,28.2,28.1,21.5$.

## (R)-4-(((tert-Butoxycarbonyl)amino)methyl)-5-(((S)-1-carboxy-2-phenylethyl)amino) -4-methyl-5-oxopentanoic acid 167

The title compound was prepared from (S)-tert-butyl 2-((R)-2-(((tert-butoxycarbonyl)amino)methyl)-6-hydroxy-2,6-dimethyl-5-oxoheptanamido)-3-phenylpropanoate $\mathbf{1 6 6}$ ( $32 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) following the synthetic previously described for the transformation of the ketol moiety to carboxylic acid with $\mathrm{NaIO}_{4}$ in MeOH and $\mathrm{H}_{2} \mathrm{O}$. The reaction mixture was stirred for 16 h until completion of reaction. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/ethyl acetate $50 / 50$ ) to give the title compound as a white foam ( $10 \mathrm{mg}, 0.024 \mathrm{mmol}, 40 \%$ yield). $[\alpha]_{\mathrm{D}}{ }^{23}=+8.2^{\circ}\left(\mathrm{c}=0.5, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.90-7.80(\mathrm{~m}, 1 \mathrm{H}), 7.79$ - $7.70(\mathrm{~m}, 1 \mathrm{H}), 7.53-7.45(\mathrm{~m}, 1 \mathrm{H}), 7.44-7.37(\mathrm{~m}, 1 \mathrm{H}), 7.27-7.11(\mathrm{~m}, 3 \mathrm{H}), 6.71-$ $6.45(\mathrm{~m}, 1 \mathrm{H}), 4.81-4.61(\mathrm{~m}, 1 \mathrm{H}), 3.60-3.46(\mathrm{~m}, 1 \mathrm{H}), 3.41-3.28(\mathrm{~m}, 1 \mathrm{H}), 3.17-2.96$ $(\mathrm{m}, 2 \mathrm{H}), 2.38-2.19(\mathrm{~m}, 1 \mathrm{H}), 2.20-2.11(\mathrm{~m}, 1 \mathrm{H}), 2.05-1.87(\mathrm{~m}, 1 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H}), 1.20$ $(\mathrm{s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 176.4,176.3,175.2,170.9,133.4,129.5,128.8$, 127.4, 80.8, 54.1, 50.1, 47.5, 38.2, 23.0, 29.6, 28.5, 28.2.

### 6.6. EXPERIMENTAL SECTION OF CHAPTER 4

6.6.1. Preparation of (dichloro)iodobenzene $\mathbf{P h I C l}_{2}{ }^{354}$

## General procedure

Aq $5.84 \% \mathrm{NaOCl}$ soln ( 32 mL ) was added dropwise over 1 h to a vigorously stirred soln of iodobenzene $(0.90 \mathrm{~mL}, 8 \mathrm{mmol})$ in concd $\mathrm{HCl}(8 \mathrm{~mL})$ at r.t. Stirring was continued for a further 2 h when the addition of NaOCl was complete. The precipitated yellow solid was collected by filtration, washed with $\mathrm{H}_{2} \mathrm{O}$ and light petroleum ether, and dried at r.t. in the dark overnight. The solid was identified to be $\mathrm{PhICl}_{2}$ by comparison of its m.p. with that reported in the literature. Yield: $2.16 \mathrm{~g}, 7.86 \mathrm{mmol}, 98 \%$.

### 6.6.2. Preparation alkyl sulfides ${ }^{355}$

Dried zinc iodide ( 5 mmol ) was added to a solution of alcohol $\mathbf{1 8 0}(10 \mathrm{mmol})$ in dry 1,2-dichloroethane ( 20 mL ). To the obtained suspension thiophenol ( 12 mmol ) was addes and the reaction mixture was stirred at room temperature until the consumption of the alcohol. The reaction was quenched with water ( 50 mL ) and the reaction products worked up by extraction with dichloromethane ( $2 \times 30 \mathrm{~mL}$ ). The combined organic extracts were washed with brine and dried over NaSO 4 from which solvent was evaporated at reduced pressure. The residue was purified by silica gel column chromatography (hex:EtOAc, 98:2).

## Phenyl(1-phenylbuty) sulfane 181a ${ }^{356}$

Prepared according to the general procedure starting from 1-phenylbutan1 -ol ( $451 \mathrm{mg}, 3 \mathrm{mmol}$ ). The title compound was isolated as a colourless oil after short silica column chromatography (98:2, Hex:EtOAc). Yield:

[^124]$71 \%$ ( $516 \mathrm{mg}, 2.13 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.3-6.9(\mathrm{~m}, 10 \mathrm{H}), 4.10(\mathrm{t}, J=7 \mathrm{~Hz}, 1 \mathrm{H})$, $2.1-1.7(\mathrm{~m}, 2 \mathrm{H}), 1.6-1.0(\mathrm{~m}, 2 \mathrm{H}), 0.85(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H})$.

## (1-(Naphthalen-1-yl)pentyl)(phenyl)sulfane 181b

1 SPh Prepared according to the general procedure starting from 1-(naphthalen-1-yl)pentan-1-ol ( $643 \mathrm{mg}, 3 \mathrm{mmol}$ ). The title compound was isolated as a colourless oil after short silica column chromatography (98:2, Hex:EtOAc). Yield: $60 \%$ ( $551 \mathrm{mg}, 1.80 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 1 \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl} 3$ ) $\delta 8.17-8.05(\mathrm{~m}, 1 \mathrm{H}), 7.84(\mathrm{dd}, \mathrm{J}=7.9,1.8$ $\mathrm{Hz}, 1 \mathrm{H}), 7.76(\mathrm{dt}, J=8.2,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.53-7.39(\mathrm{~m}, 3 \mathrm{H}), 7.28-7.14(\mathrm{~m}, 1 \mathrm{H}), 5.08$ (dd, $J=8.2,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.72(\mathrm{dq}, J=12.2,9.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.58(\mathrm{dq}, J=12.2,8.6 \mathrm{~Hz}, 1 \mathrm{H})$, $2.07-1.93(\mathrm{~m}, 1 \mathrm{H}), 1.93-1.79(\mathrm{~m}, 1 \mathrm{H}), 1.60-1.45(\mathrm{~m}, 1 \mathrm{H}), 1.43-1.26(\mathrm{~m}, 3 \mathrm{H}), 0.85$ $(\mathrm{t}, \mathrm{J}=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## ((4-Bromophenyl)(phenyl)methyl)(phenyl)sulfane 181c

Prepared according to the general procedure starting from (4bromophenyl)(phenyl)methanol (790 mg, 3 mmol ). The title compound was isolated as a colourless oil after short silica column chromatography ( $98: 2, \mathrm{Hex}: \mathrm{EtOAc}$ ). Yield: $55 \%$ ( $586 \mathrm{mg}, 1.65 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.45-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.23(\mathrm{~m}, 5 \mathrm{H})$, $7.21-7.15(\mathrm{~m}, 2 \mathrm{H}), 5.10(\mathrm{~s}, 1 \mathrm{H}), 3.76(\mathrm{q}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H})$.

## Phenyl(2-phenylpropan-2-yl)sulfane 181d ${ }^{357}$

Prepared according to the general procedure starting from 2-phenylpropan-2ol ( $409 \mathrm{mg}, 3 \mathrm{mmol}$ ). The title compound was isolated as a colourless oil after short silica column chromatography (98:2, Hex:EtOAc). Yield: 68\% ( $466 \mathrm{mg}, 2.04 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.36-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.03(\mathrm{~m}, 8 \mathrm{H}), 1.61(\mathrm{~s}$, 6 H ).

[^125]
### 6.6.3. Preparation $\boldsymbol{\beta}$-sulfido (thio)esters compounds

### 6.6.3.1. Preparation of acrylates $\mathbf{1 8 4} 4^{358}$

## General procedure

4-Dimethylaminopyridine ( $37 \mathrm{mg}, 0.3 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) was dissolved in DMF ( 7 mL ). The malonic acid half ester ( $0.53 \mathrm{~mL}, 4.5 \mathrm{mmol}, 1.5$ equiv.), the aldehyde ( 3 mmol , 1 equiv.) and piperidine ( $30 \mu \mathrm{~L}, 0.3 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) were added. The reaction mixture was stirred at room temperature until the aldehyde was consumed. Water ( 20 mL ) was added and the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the organic layer was washed successively with $\mathrm{NH}_{4} \mathrm{Cl}$, water, $\mathrm{NaHCO}_{3}$ and once again with water. After drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and filtering, all volatiles were evaporated under vacuum. All the spectroscopic data of synthetized acrylates was identical to reported in the literature.

## (E)-Ethyl 3-(p-tolyl)acrylate 184b ${ }^{359}$

Prepared according to the general procedure starting from $p$ tolualdehyde ( $0.35 \mathrm{~mL}, 3 \mathrm{mmol}$ ). The reaction was completed in 72h. The title compound was isolated as a colourless oil after short silica column chromatography (95:5, Hex:EtOAc). Yield: $96 \% ~(548 \mathrm{mg}, 2.88 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.66(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.42(\mathrm{~d}, J=8.1$ $\mathrm{Hz}, 2 \mathrm{H}), 7.19(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.39(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.26(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$, 2.37 (s, 3H), 1.33 (t, $J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

[^126]
## (E)-Ethyl 3-(4-methoxyphenyl)acrylate 184c ${ }^{358}$

Prepared according to the general procedure starting from $p$ anisaldehyde ( $0.36 \mathrm{~mL}, 3 \mathrm{mmol}$ ). The reaction was completed short silica column chromatography ( $90 \cdot 10, \mathrm{Hex} \cdot \mathrm{EtOAc}$ ). Yield. $96 \%$ ( $591 \mathrm{mg}, 2.87$ mmol ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.64(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.47(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.90(\mathrm{~d}, J=8.8$ $\mathrm{Hz}, 2 \mathrm{H}), 6.30(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.25(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 1.33(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H})$.

## ( E)-Ethyl 3-(4-chlorophenyl)acrylate $\mathbf{1 8 4 d}^{360}$

Prepared according to the general procedure starting from 4chlorobenzaldehyde ( $422 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after short silica column chromatography (90:10, Hex:EtOAc). Yield: 77\% ( $488 \mathrm{mg}, 2.31 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.63(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.51-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.41$ $-7.32(\mathrm{~m}, 2 \mathrm{H}), 6.40(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.26(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.33(\mathrm{t}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H})$.

## ( E)-Ethyl 3-(2,4,5-trifluorophenyl)acrylate 184e ${ }^{361}$

Prepared according to the general procedure starting from 2,4,5trifluorobenzaldehyde ( $0.34 \mathrm{~mL}, 3 \mathrm{mmol}$ ). The reaction was completed in 72 h . The title compound was isolated as a colourless oil after short silica column chromatography (95:5, Hex:EtOAc). Yield: $71 \%$ ( $490 \mathrm{mg}, 2.13 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.78-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.35$ (ddd, $J=10.5,8.6,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{td}, J=9.8,6.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.44(\mathrm{~d}, J=16.2 \mathrm{~Hz}, 1 \mathrm{H})$, $4.27(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.34(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

[^127]
## (E)-Ethyl 3-(naphthalen-1-yl)acrylate $184 \mathbf{f}^{358}$

Prepared according to the general procedure starting from 1naphthaldehyde ( $0.41 \mathrm{~mL}, 3 \mathrm{mmol}$ ). The reaction was completed in 72 h . The title compound was isolated as a colourless oil after short silica column chromatography ( $95: 5$, Hex:EtOAc). Yield: $95 \%$ ( $649 \mathrm{mg}, 2.87$ mmol ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.53(\mathrm{~d}, J=15.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.20(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.94-7.75(\mathrm{~m}$, $2 \mathrm{H}), 7.76(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.65-7.40(\mathrm{~m}, 3 \mathrm{H}), 6.53(\mathrm{~d}, J=15.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.32(\mathrm{q}, J=$ $7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.38(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-ethyl 3-(4-cyanophenyl)acrylate $184 \mathbf{j}^{362}$

Prepared according to the general procedure starting from 4cyanobenzaldehyde ( $393 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after short silica column chromatography (95:5, Hex:EtOAc). Yield: $72 \%$ ( $435 \mathrm{mg}, 2.16 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.71-7.65(\mathrm{~m}, 3 \mathrm{H}), 7.65-$ $7.57(\mathrm{~m}, 2 \mathrm{H}), 6.51(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.35(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-Ethyl 3-(4-(trifluoromethyl)phenyl)acrylate $184 \mathbf{k}^{360}$

Prepared according to the general procedure starting from 4(trifluoromethyl)benzaldehyde ( $0.41 \mathrm{~mL}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after short silica column chromatography ( $95: 5$, Hex:EtOAc). Yield: $98 \%$ ( $719 \mathrm{mg}, 2.94 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 7.69 (d, $J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.68-7.56$ (m, 4H), $6.51(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{q}, J=7.1$ $\mathrm{Hz}, 2 \mathrm{H}), 1.35(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-Ethyl 3-(3-cyanophenyl)acrylate 1841 ${ }^{363}$

Prepared according to the general procedure starting from 3cyanobenzaldehyde ( $393 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after short silica column chromatography (80:20, Hex:EtOAc). Yield: 95\%

[^128]( $572 \mathrm{mg}, 2.84 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.79(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.74(\mathrm{dt}, J=7.9,1.5 \mathrm{~Hz}$, $1 \mathrm{H}), 7.69-7.59(\mathrm{~m}, 2 \mathrm{H}), 7.51(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{q}, J=$ $7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.35(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-Ethyl 3-(3-hydroxyphenyl)acrylate $184 \mathbf{m}^{364}$

Prepared according to the general procedure starting from 3hydroxybenzaldehyde ( $366 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after short silica column chromatography (80:20, Hex:EtOAc). Yield: $98 \%$ ( $565 \mathrm{mg}, 2.94 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.63(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.18(\mathrm{~m}$, $1 \mathrm{H}), 7.09$ (dt, $J=7.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.06-6.97(\mathrm{~m}, 1 \mathrm{H}), 6.87(\mathrm{ddd}, J=8.1,2.5,0.9 \mathrm{~Hz}$, $1 \mathrm{H}), 6.41(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.45(\mathrm{~s}, 1 \mathrm{H}), 4.27(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.34(\mathrm{t}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H})$.

## (E)-Ethyl 3-(3-nitrophenyl)acrylate 184n ${ }^{365}$

Prepared according to the general procedure starting from 3nitrobenzaldehyde ( $453 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after short silica column chromatography (90:10, Hex:EtOAc). Yield: 95\% ( $630 \mathrm{mg}, 2.95 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.38(\mathrm{t}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.23(\mathrm{dd}, J=8.2,1.3 \mathrm{~Hz}$, $1 \mathrm{H}), 7.82(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.72(\mathrm{~d}, J=16.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.56(\mathrm{~d}$, $J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.36-4.24(\mathrm{~m}, 2 \mathrm{H}), 1.35(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H})$.

## (E)-Ethyl 3-(pyridin-3-yl)acrylate $184 \mathbf{o}^{366}$

Prepared according to the general procedure starting from 3pyridinecarboxaldehyde $(0.29 \mathrm{~mL}, 3 \mathrm{mmol})$. The reaction was completed in 24 h . The title compound was isolated as a colourless oil after short silica column chromatography (80:20, Hex:EtOAc). Yield: 79\% (418 mg, $2.37 \mathrm{mmol})$. Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.74(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.60(\mathrm{dd}, J=4.8,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.83$

[^129]$(\mathrm{dt}, J=8.0,1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.67(\mathrm{~d}, J=16.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.33(\mathrm{dd}, J=7.9,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.50(\mathrm{~d}$, $J=16.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.34(\mathrm{t}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$.

### 6.6.3.2. Sulfa-Michael addition of thiophenol to acrylates 184

To the corresponding acrylate 184, thiophenol ( 1.1 equiv.) and triethylamine (10 $\mathrm{mol} \%$ ) were added and the reaction mixture was stirred at room temperature until the consumption of the starting material.

## Ethyl 3-phenyl-3-(phenylthio)propanoate 186a ${ }^{367}$

Prepared according to the general procedure with ethyl cinnamate $(529 \mathrm{mg}, 3 \mathrm{mmol})$. The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography ( $95: 5$, Hex:EtOAc). Yield: $91 \%$ ( $781 \mathrm{mg}, 2.73 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $7.49-7.35(\mathrm{~m}, 2 \mathrm{H}), 7.36-7.20(\mathrm{~m}, 8 \mathrm{H}), 4.72(\mathrm{dd}, J=8.4,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.09(\mathrm{qd}, J=7.1$, $3.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.03(\mathrm{dd}, J=14.9,6.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.97(\mathrm{dd}, J=14.9,7.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.19(\mathrm{t}, J=$ $7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.7$, 140.7, 133.8, 133.4, 128.9, 128.5, 127.8, 127.8, 127.6, 60.7, 49.3, 41.1, 14.2.

## Ethyl 3-(phenylthio)-3-(p-tolyl)propanoate 186b

Prepared according to the general procedure with $(E)$-ethyl 3-(p-tolyl)acrylate ( $548 \mathrm{mg}, 2.88 \mathrm{mmol}$ ). The reaction was completed in 72 h . The title compound was isolated as a colourless oil after silica column chromatography (95:5, Hex:EtOAc). Yield: 79\% (684 $\mathrm{mg}, 2.28 \mathrm{mmol}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.31-7.25(\mathrm{~m}, 2 \mathrm{H}), 7.21-7.15(\mathrm{~m}, 3 \mathrm{H})$, $7.13-7.09(\mathrm{~m}, 2 \mathrm{H}), 7.04-6.98(\mathrm{~m}, 2 \mathrm{H}), 4.60(\mathrm{dd}, J=8.4,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.06-3.91(\mathrm{~m}$, $2 \mathrm{H}), 2.95-2.87(\mathrm{~m}, 1 \mathrm{H}), 2.87-2.80(\mathrm{~m}, 1 \mathrm{H}), 2.24(\mathrm{~s}, 3 \mathrm{H}), 1.09(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.8,137.6,137.2,134.1,133.2,129.2,128.9,127.7,127.6$, 60.7, 48.9, 41.3, 21.2, 14.2.

## Ethyl 3-(4-methoxyphenyl)-3-(phenylthio)propanoate 186c

Prepared according to the general procedure with ( $E$ )-ethyl 3-(4-methoxyphenyl)acrylate ( $591 \mathrm{mg}, 2.87 \mathrm{mmol}$ ). The reaction was completed in 72 h . The title compound was isolated as a colourless oil after silica column chromatography (95:5, Hex:EtOAc). Yield: 80\% (736 $\mathrm{mg}, 2.32 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.32-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.23-7.14(\mathrm{~m}, 3 \mathrm{H})$,

[^130]$7.19-7.10(\mathrm{~m}, 2 \mathrm{H}), 6.80-6.71(\mathrm{~m}, 2 \mathrm{H}), 4.60(\mathrm{dd}, J=8.6,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.99(\mathrm{qd}, J=7.1$, $4.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 2.96-2.78(\mathrm{~m}, 2 \mathrm{H}), 1.10(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 170.8,159.0,134.0,133.3,132.6,128.9,128.9,127.8,113.9,60.7,55.3,48.7$, 41.3, 14.2.

## Ethyl 3-(4-chlorophenyl)-3-(phenylthio)propanoate 186d

Prepared according to the general procedure with $(E)$-ethyl 3-(4chlorophenyl)acrylate ( $488 \mathrm{mg}, 2.31 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography (98:2, Hex:EtOAc). Yield: 94\% (699 $\mathrm{mg}, 2.18 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.33-7.23(\mathrm{~m}, 2 \mathrm{H}), 7.28-7.18(\mathrm{~m}, 5 \mathrm{H})$, $7.20-7.12(\mathrm{~m}, 2 \mathrm{H}), 4.59$ (ddd, $J=8.1,6.9,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{qd}, J=7.1,3.9 \mathrm{~Hz}, 2 \mathrm{H})$, $2.94(\mathrm{dd}, J=15.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{dd}, J=15.7,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.15(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.6,139.4,133.8,133.4,133.4,129.2,129.1,128.8$, 128.2, 61.0, 48.8, 41.0, 14.3.

Ethyl 3-(phenylthio)-3-(2,4,5-trifluorophenyl)propanoate 186e

Prepared according to the general procedure with ( $E$-ethyl 3-(2,4,5-trifluorophenyl)acrylate ( $490 \mathrm{mg}, 2.13 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography (95:5, Hex:EtOAc). Yield: $60 \%(435 \mathrm{mg}, 1.28 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.35-$ $7.26(\mathrm{~m}, 2 \mathrm{H}), 7.26(\mathrm{qd}, J=4.3,1.4 \mathrm{~Hz}, 3 \mathrm{H}), 7.02(\mathrm{ddd}, J=10.7,8.6,6.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.84$ (td, $J=9.7,6.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.86(\mathrm{ddd}, J=8.4,7.0,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.07(\mathrm{qd}, J=7.1,4.9 \mathrm{~Hz}$, 2H), 2.95 (dd, $J=16.0,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{dd}, J=16.0,8.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.17(\mathrm{t}, J=7.1 \mathrm{~Hz}$, 3H). NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.1,155.4$ (ddd), $150.9-147.6$ (m), $148.4-144.9$ (m), 133.9, 132.7, 129.2, 128.6, 124.8 (dt), 116.6 (ddd), 105.7 (dd), 61.1, 41.6, 40.1, 14.2.

## Ethyl 3-(naphthalen-1-yl)-3-(phenylthio)propanoate 186f

Prepared according to the general procedure with ( $E$ )-ethyl 3-(naphthalen-1-yl)acrylate ( $649 \mathrm{mg}, 2.87 \mathrm{mmol}$ ). The reaction was completed in 40 h . The title compound was isolated as a colourless oil after silica column chromatography (98:2, Hex:EtOAc). Yield: 80\% (774 $\mathrm{mg}, 2.30 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.29(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.89-7.82(\mathrm{~m}$, $1 \mathrm{H}), 7.74(\mathrm{dd}, J=5.9,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.57(\mathrm{ddd}, J=8.4,6.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.49(\mathrm{ddd}, J=$ $7.9,6.7,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.39-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.31-7.23(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.16(\mathrm{~m}, 3 \mathrm{H}), 5.50$ $(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.14-3.89(\mathrm{~m}, 2 \mathrm{H}), 3.11(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.10(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 171.1,136.0,134.2,133.7,131.0,129.1,129.0,128.4$, $128.0,126.5,125.9,125.2,124.8,123.4,60.9,41.1,14.2$.

## Methyl 3-phenyl-3-(phenylthio)propanoate $186 \mathbf{g}^{368}$

Prepared according to the general procedure with methyl cinnamate ( $487 \mathrm{mg}, 3 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography ( $95: 5$, Hex:EtOAc). Yield: $92 \%$ ( $751 \mathrm{mg}, 2.76 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $7.34-7.28(\mathrm{~m}, 2 \mathrm{H}), 7.28-7.19(\mathrm{~m}, 8 \mathrm{H}), 4.70-4.60(\mathrm{~m}, 1 \mathrm{H}), 3.59(\mathrm{~s}, 3 \mathrm{H}), 2.98(\mathrm{dd}, J=$ $14.1,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dd}, J=14.1,6.5 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 171.2$, $140.5,133.7,133.3,128.9,128.5,127.8,127.6,127.6,51.8,49.1,40.8$.

## 1,1,1,3,3,3-Hexafluoropropan-2-yl 3-phenyl-3-(phenylthio)propanoate $186{ }^{369}$

Prepared according to the general procedure with $1,1,1,3,3,3-$ hexafluoropropan- 2 -yl cinnamate ( $596 \mathrm{mg}, 2.00 \mathrm{mmol}$ ). The reaction was completed in 40 h . The title compound was isolated as a colourless oil after silica column chromatography (98:2, Hex:EtOAc). Yield: 60\% ( $490 \mathrm{mg}, 1.20 \mathrm{mmol}$ ). Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.20-7.28(\mathrm{~m}, 10 \mathrm{H}), 5.66$ (hept, $J=6.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), $4.61(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.14(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 167.6$, 139.2, 133.8, 132.8, 129.0, 128.6, 128.3, 127.9, 127.5, 120.2 (q), 66.5 (hept), 48.7, 39.9.

## Ethyl 3-(4-cyanophenyl)-3-(phenylthio)propanoate 186j

Prepared according to the general procedure with ( $E$ )-ethyl 3-(4cyanophenyl)acrylate ( $435 \mathrm{mg}, 2.16 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography (90:10, Hex:EtOAc). Yield: $83 \%$ ( $558 \mathrm{mg}, 1.79$ $\mathrm{mmol}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.57-7.48(\mathrm{~m}, 2 \mathrm{H}), 7.33-7.19(\mathrm{~m}, 7 \mathrm{H}), 4.62(\mathrm{dd}$, $J=8.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{qd}, J=7.1,4.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.98(\mathrm{dd}, J=16.0,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.88$ $(\mathrm{dd}, J=16.0,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.15(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) . \mathrm{NMR}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 170.3$, 146.4, 134.1, 132.5, 132.3, 129.2, 128.6, 118.8, 111.4, 61.1, 49.1, 40.3, 14.2

[^131]
## Ethyl 3-(phenylthio)-3-(4-(trifluoromethyl)phenyl)propanoate 186k

Prepared according to the general procedure with ( $E$ )-ethyl 3-(4(trifluoromethyl)phenyl)acrylate ( $719 \mathrm{mg}, 2.94 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography (98:2, Hex:EtOAc). Yield: $81 \%(844 \mathrm{mg}, 2.38 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.49$ (d, J $=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.32(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.31-7.22(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.16(\mathrm{~m}, 3 \mathrm{H}), 4.65$ (dd, $J=8.7,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.03(\mathrm{qq}, J=7.2,3.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.97(\mathrm{dd}, J=15.9,6.9 \mathrm{~Hz}, 1 \mathrm{H})$, $2.88(\mathrm{dd}, J=15.9,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.12(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $170.4,145.0$ (q), 129.8 (q), 129.1, 128.4, 128.2, 125.5 (q), 122.9, 61.0, 49.0, 40.7, 14.2.

## Ethyl 3-(3-cyanophenyl)-3-(phenylthio)propanoate 1861

Prepared according to the general procedure with ( $E$ )-ethyl 3-(3cyanophenyl)acrylate ( $572 \mathrm{mg}, 2.84 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a colourless oil after silica column chromatography (90:10, Hex:EtOAc). Yield: 65\% $(575 \mathrm{mg}, 1.85 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.51-7.41(\mathrm{~m}, 3 \mathrm{H}), 7.33(\mathrm{td}, J=$ $7.3,1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.30-7.17(\mathrm{~m}, 5 \mathrm{H}), 4.61(\mathrm{dd}, J=8.8,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{qd}, J=7.1,3.7$ $\mathrm{Hz}, 2 \mathrm{H}$ ), 2.97 (dd, $J=16.0,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.87(\mathrm{dd}, J=16.0,8.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.14(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H})$. NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.2,142.5,133.9,132.5,132.3,131.3,131.2$, 129.3, 129.1, 128.5, 118.6, 112.5, 61.0, 48.6, 40.4, 14.2.

## Ethyl 3-(3-hydroxyphenyl)-3-(phenylthio)propanoate 186m

Prepared according to the general procedure with (E)-ethyl 3-(3hydroxyphenyl)acrylate ( $565 \mathrm{mg}, 2.94 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after silica column chromatography (90:10, Hex:EtOAc). Yield: 59\% $(524 \mathrm{mg}, 1.73 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.32$ (ddd, $J=6.8,3.6,2.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.27-7.19(\mathrm{~m}, 3 \mathrm{H}), 7.12(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.81(\mathrm{dt}, J=7.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.77(\mathrm{t}, J=$ $2.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.70(\mathrm{ddd}, J=8.2,2.5,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.09(\mathrm{~s}, 1 \mathrm{H}), 4.60(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H})$, 4.06 (qd, $J=7.1,4.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.99-2.92(\mathrm{~m}, 1 \mathrm{H}), 2.92-2.86(\mathrm{~m}, 1 \mathrm{H}), 1.16(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H})$. NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 171.5,171.5,156.1,142.3,133.8,133.4,129.8$, 129.0, 128.0, 120.0, 114.9, 114.8, 61.2, 49.1, 41.3, 14.2.

## Ethyl 3-(3-nitrophenyl)-3-(phenylthio)propanoate 186n

Prepared according to the general procedure with ( $E$ )-ethyl 3-(3nitrophenyl)acrylate ( $630 \mathrm{mg}, 2.95 \mathrm{mmol}$ ). The reaction was completed in 24 h . The title compound was isolated as a white solid after silica column chromatography (90:10, Hex:EtOAc). Yield: 74\% $(723 \mathrm{mg}, 2.18 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.10-8.02(\mathrm{~m}, 2 \mathrm{H}), 7.54(\mathrm{dt}, J=$ $7.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.46-7.37(\mathrm{~m}, 1 \mathrm{H}), 7.31-7.18(\mathrm{~m}, 5 \mathrm{H}), 4.69(\mathrm{dd}, J=8.9,6.7 \mathrm{~Hz}, 1 \mathrm{H})$, $4.06(\mathrm{qd}, J=7.1,4.9 \mathrm{~Hz}, 2 \mathrm{H}), 3.01(\mathrm{dd}, J=16.0,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dd}, \mathrm{J}=16.0,8.9 \mathrm{~Hz}$, $1 \mathrm{H}), 1.16(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.3,148.4,143.2$, 134.1, 134.1, 132.5, 129.5, 129.3, 128.7, 122.8, 122.7, 61.2, 48.8, 40.6, 14.3.

## Ethyl 3-(phenylthio)-3-(pyridin-3-yl)propanoate 1860

Prepared according to the general procedure with $(E)$-ethyl 3-(pyridin3 -yl)acrylate ( $418 \mathrm{mg}, 2.37 \mathrm{mmol}$ ). The reaction was completed in 24h. The title compound was isolated as a yellow oil after silica column chromatography (80:20, Hex:EtOAc). Yield: $73 \%$ ( $497 \mathrm{mg}, 1.73 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.47-8.36(\mathrm{~m}, 2 \mathrm{H}), 7.54(\mathrm{dt}, J=7.9,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-$ $7.17(\mathrm{~m}, 5 \mathrm{H}), 7.20-7.12(\mathrm{~m}, 1 \mathrm{H}), 4.61(\mathrm{dd}, J=8.8,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{qq}, J=7.1,3.7$ $\mathrm{Hz}, 2 \mathrm{H}), 2.98$ (dd, $J=15.8,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.89(\mathrm{dd}, J=15.8,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.13(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H})$. NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.3,149.4,148.9,136.4,135.0,134.0,132.6$, 129.1, 128.4, 123.4, 61.0, 46.8, 40.5, 14.2.

### 6.6.4. Desulfurative chlorination of alkyl phenyl sulfides with $\mathbf{P h I C l}_{\mathbf{2}}$

The corresponding alkyl phenyl sulfide $\mathbf{1 8 1}(0.5 \mathrm{mmol})$ was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$ and $\mathrm{PhICl}_{2}(151 \mathrm{mg}, 0.55 \mathrm{mmol}, 1.1$ equiv.) was added in one portion. The reaction mixture was stirred in the dark until the color from yellow to orange ( 5 min ). The solvent was evaporated under reduced pressure and the adducts were purified by silica gel column chromatography.

Sensitive chlorides towards column chromatography on silica gel were isolated as their corresponding trifluoroethyl ether derivatives $\mathbf{1 8 3}{ }^{370}$ To a mixture of the crude benzyl chloride ( 0.5 mmol ) and 2,6-lutidine ( $0.17 \mathrm{~mL}, 1.5 \mathrm{mmol}, 3$ equiv.), TFE ( 5 mL )

[^132]was added during stirring and ice cooling. The mixture was stirred for 2 h , added HCl $(5 \%, 30 \mathrm{~mL})$ and diluted with pentane ( 20 mL ). The aqueous layer was extracted with pentane ( $2 \times 20 \mathrm{~mL}$ ), the combined organic layers washed with $\mathrm{HCl}(5 \%, 2 \times 30 \mathrm{~mL})$ and brine ( $3 \times 30 \mathrm{~mL}$ ). After drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporation of solvent, trifluoroethyl ether derivatives were obtained.

## (1-Chlorobutyl)benzene 182a

The title compound was preprared according the general procedure from phenyl(1-phenylbutyl)sulfane ( $121 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $60 \mathrm{mg}, 0.36$ mmol, $71 \%$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.45-7.27(\mathrm{~m}, 5 \mathrm{H}), 4.87(\mathrm{dd}, J=8.2,6.4 \mathrm{~Hz}$, 1 H ), 2.13 (dddd, $J=13.6,9.8,8.2,5.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.01$ (ddt, $J=13.9,9.6,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.50$ (dddd, $J=15.1,9.5,5.2,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.44-1.28(\mathrm{~m}, 1 \mathrm{H}), 0.94(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 142.2,128.8,128.4,127.2,63.8,42.3,20.5,13.7$.

## 1-(1-(2,2,2-Trifluoroethoxy)pentyl)naphthalene 183b

The title compound was preprared according the general procedure from (1-(naphthalen-1-yl)pentyl)(phenyl)sulfane ( $153 \mathrm{mg}, 0.5$ mmol ) and the product was isolated as trifluoroethyl ether derivative (colourless oil). Yield: $104 \mathrm{mg}, 0.35 \mathrm{mmol}, 70 \%$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.17-8.05(\mathrm{~m}, 1 \mathrm{H}), 7.84(\mathrm{dd}, J=7.9,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.76(\mathrm{dt}, J$ $=8.2,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.53-7.39(\mathrm{~m}, 3 \mathrm{H}), 7.28-7.14(\mathrm{~m}, 1 \mathrm{H}), 5.08(\mathrm{dd}, J=8.2,4.9 \mathrm{~Hz}$, $1 \mathrm{H}), 3.72(\mathrm{dq}, J=12.2,9.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.58(\mathrm{dq}, J=12.2,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.07-1.93(\mathrm{~m}, 1 \mathrm{H})$, $1.93-1.79(\mathrm{~m}, 1 \mathrm{H}), 1.60-1.45(\mathrm{~m}, 1 \mathrm{H}), 1.43-1.26(\mathrm{~m}, 3 \mathrm{H}), 0.85(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

## 1-Bromo-4-(phenyl(2,2,2-trifluoroethoxy)methyl)benzene 183c

The title compound was preprared according the general procedure from ((4-bromophenyl)(phenyl)methyl)(phenyl)sulfane (178 mg, 0.5 mmol ) and the product was isolated as trifluoroethyl ether derivative (colourless oil). Yield: $117 \mathrm{mg}, 0.34 \mathrm{mmol}, 79 \% .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.45-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.23(\mathrm{~m}, 5 \mathrm{H}), 7.21-7.15(\mathrm{~m}$, $2 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H}), 3.76(\mathrm{q}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 140.0, 139.9, $131.9,129.0,128.8,128.6,127.3,124.2$ (q), 122.2, 84.1, 66.2 (q).

## (2-Chloropropan-2-yl)benzene 182d ${ }^{371}$

The title compound was preprared according the general procedure from phenyl(2-phenylpropan-2-yl)sulfane ( $114 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $66 \mathrm{mg}, 0.43 \mathrm{mmol}, 85 \%$. Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.60-7.15(\mathrm{~m}, 5 \mathrm{H}), 5.13(\mathrm{q}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.83(\mathrm{~d}, J=7.0$ $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\mathrm{CDCl}_{3}$ ) $\delta$ 141.4, 128.4, 125.9, 125.1, 69.2, 34.0.

### 6.6.5. Desulfurative chlorination of sulfa-Michael derived sulfides with $\mathbf{P h I C l}_{\mathbf{2}}$

The corresponding $\beta$-sulfido (thio)ester 186 ( 0.5 mmol ) was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 3 mL ) and $\mathrm{PhICl}_{2}(151 \mathrm{mg}, 0.55 \mathrm{mmol}, 1.1$ equiv.) was added in one portion. The reaction mixture was stirred in the dark until the color from yellow to orange ( 5 min ). The solvent was evaporated under reduced pressure and the adducts $\mathbf{1 8 7}$ were purified by silica gel column chromatography.

Sensitive chlorides towards column chromatography on silica gel were isolated as their corresponding trifluoroethyl ether derivatives $\mathbf{1 8 8}{ }^{370}$ To a mixture of the crude benzyl chloride ( 0.5 mmol ) and 2,6-lutidine ( $0.17 \mathrm{~mL}, 1.5 \mathrm{mmol}, 3$ equiv.), TFE ( 5 mL ) was added during stirring and ice cooling. The mixture was stirred for 2 h , added HCl $(5 \%, 30 \mathrm{~mL})$ and diluted with pentane ( 20 mL ). The aqueous layer was extracted with pentane ( $2 \times 20 \mathrm{~mL}$ ), the combined organic layers washed with $\mathrm{HCl}(5 \%, 2 \times 30 \mathrm{~mL})$ and brine ( $3 \times 30 \mathrm{~mL}$ ). After drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporation of solvent, trifluoroethyl ether derivatives were obtained.

## Ethyl 3-chloro-3-phenylpropanoate $187 \mathbf{a}^{372}$

The title compound was preprared according the general procedure from ethyl 3-phenyl-3-(phenylthio)propanoate ( $143 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: 87 $\mathrm{mg}, 0.41 \mathrm{mmol}, 82 \%$. Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.49-7.29(\mathrm{~m}, 5 \mathrm{H}), 5.35(\mathrm{dd}, J=9.0,5.8 \mathrm{~Hz}, 1 \mathrm{H})$, $4.25-4.09(\mathrm{~m}, 2 \mathrm{H}), 3.18(\mathrm{dd}, J=15.9,9.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.03(\mathrm{dd}, J=15.9,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.24$

[^133]$(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.5,140.4,128.8,128.7$, 127.0, 61.0, 58.2, 45.0, 14.2.

## Ethyl 3-chloro-3-(p-tolyl)propanoate 187b

The title compound was preprared according the general procedure from ethyl 3-(phenylthio)-3-(p-tolyl)propanoate (150 $\mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $96 \mathrm{mg}, 0.43 \mathrm{mmol}, 85 \%$. ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.33-7.28(\mathrm{~m}, 2 \mathrm{H}), 7.20-7.14(\mathrm{~m}, 2 \mathrm{H}), 5.33(\mathrm{dd}, J=9.0,5.9 \mathrm{~Hz}, 1 \mathrm{H})$, 4.16 (qd, $J=7.1,2.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), $3.17(\mathrm{dd}, J=15.9,9.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.01(\mathrm{dd}, J=15.9,5.9 \mathrm{~Hz}$, $1 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}), 1.24(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.8,138.8$, 137.6, 129.7, 127.0, 61.2, 58.3, 45.1, 21.4, 14.3.

## Ethyl 3-(4-methoxyphenyl)-3-(2,2,2-trifluoroethoxy)propanoate 188c

The title compound was preprared according the general procedure from ethyl 3-(4-methoxyphenyl)-3(phenylthio)propanoate ( $158 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the product was isolated as trifluoroethyl ether derivative (colourless oil). Yield: $78 \mathrm{mg}, 0.26 \mathrm{mmol}, 51 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.45-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.23(\mathrm{~m}, 5 \mathrm{H}), 7.21-7.15(\mathrm{~m}$, $2 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H}), 3.76(\mathrm{q}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 140.0,139.9$, $131.9,129.0,128.8,128.6,127.3,124.2$ (q), 122.2, 84.1, 66.2 (q).

## Ethyl 3-chloro-3-(4-chlorophenyl)propanoate 187d

The title compound was preprared according the general procedure from ethyl 3-(4-chlorophenyl)-3-(phenylthio)propanoate ( 160 mg , 0.5 mmol ) and the chlorinated product was isolated as a colourless oil. Yield: $99 \mathrm{mg}, 0.40 \mathrm{mmol}, 80 \% .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $7.52-7.28$ (m, 4H), 5.31 (dd, $J=8.6,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.31-3.96$ (m, 2H), 3.15 (dd, $J=$ $16.0,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.00(\mathrm{dd}, J=16.0,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.23(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.3,138.9,134.6,129.1,128.5,61.2,57.2,44.9,14.2$.

## Ethyl 3-chloro-3-(2,3,5-trifluorophenyl)propanoate 187e

The title compound was preprared according the general procedure from ethyl 3-(phenylthio)-3-(2,4,5-trifluorophenyl)propanoate (170 $\mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $96 \mathrm{mg}, 0.36 \mathrm{mmol}, 72 \%$. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 7.32(\mathrm{ddd}, J=10.6,8.5,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.94(\mathrm{td}, J=9.7,6.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.55(\mathrm{ddd}, J$ $=8.3,6.2,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.16(\mathrm{qd}, J=7.1,1.9 \mathrm{~Hz}, 2 \mathrm{H}), 3.13(\mathrm{dd}, J=16.2,8.5 \mathrm{~Hz}, 1 \mathrm{H})$,
$3.02(\mathrm{dd}, J=16.2,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.24(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 169.0, 154.9 (ddd), 150.3 (ddd), 147.2 (ddd), 124.2 (dt), 116.7 (ddd), 106.2 (dd), 61.5, 50.1 (d), 43.7, 14.3.

## Ethyl 3-chloro-3-(naphthalen-1-yl)propanoate 187f

The title compound was preprared according the general procedure from ethyl 3-(naphthalen-1-yl)-3(phenylthio)propanoate ( $168 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $106 \mathrm{mg}, 0.41$ $\mathrm{mmol}, 81 \%$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.24(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.90(\mathrm{~d}, J=8.0 \mathrm{~Hz}$, $1 \mathrm{H}), 7.85(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.69(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.66-7.57(\mathrm{~m}, 1 \mathrm{H}), 7.59-7.43$ (m, 2H), 6.22 (dd, $J=9.4,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.29-4.16$ (m, 2H), $3.40(\mathrm{dd}, J=16.0,9.4 \mathrm{~Hz}$, 1 H ), 3.26 (dd, $J=16.0,5.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), $1.26(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 170.0,135.6,134.1,130.4,129.7,129.2,126.9,126.2,125.4,124.5,123.1$, 61.3, 54.6, 44.0, 14.3.

## Methyl 3-chloro-3-phenylpropanoate $187 \mathrm{~g}^{373}$

The title compound was preprared according the general procedure from methyl 3-phenyl-3-(phenylthio)propanoate ( $136 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $85 \mathrm{mg}, 0.43 \mathrm{mmol}, 86 \%$. Spectroscopic data were coincident with the previously reported ones. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.49-7.29(\mathrm{~m}, 5 \mathrm{H}), 5.35(\mathrm{dd}, J=9.1,5.7 \mathrm{~Hz}, 1 \mathrm{H})$, $3.71(\mathrm{~s}, 3 \mathrm{H}), 3.19(\mathrm{dd}, J=16.0,9.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.04(\mathrm{dd}, J=16.0,5.7 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 170.2,140.4,129.0,128.9,127.0,58.2,52.2,44.8$.

## 1,1,1,3,3,3-Hexafluoropropan-2-yl 3-chloro-3-phenylpropanoate 187h

The title compound was preprared according the general procedure from 1,1,1,3,3,3-hexafluoropropan-2-yl 3-phenyl-3(phenylthio)propanoate ( $204 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the chlorinated product was isolated as a colourless oil. Yield: $125 \mathrm{mg}, 0.38$ mmol, $75 \%$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.48-7.29(\mathrm{~m}, 5 \mathrm{H}), 5.76$ (hept, $J=6.1 \mathrm{~Hz}$, 1 H ), 5.34 (dd, $J=9.2,5.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.40(\mathrm{dd}, J=16.3,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.25(\mathrm{dd}, J=16.3,5.7$ Hz, 1H).

#### Abstract

Catalytic and asymmetric Michael reactions constitute very powerful tools for the construction of new $C-C$ bonds in synthesis, but most of the reports claiming high selectivity are limited to some specific combinations of nucleophile/electrophile compound types, and only few successful methods deal with the generation of all-carbon quaternary stereocenters. A contribution to solve this gap is presented here based on chiral bifunctional Brønsted base (BB) catalysis and the use of $\alpha^{\prime}$-oxy enones as enabling Michael acceptors with ambivalent H-bond acceptor/ donor character, a yet unreported design element for bidentate enoate equivalents. It is found that the Michael addition of a range of enolizable carbonyl compounds that have previously demonstrated challenging (i.e., $\alpha$-substituted 2 -oxindoles, cyanoesters, oxazolones, thiazolones, and azlactones) to $\alpha^{\prime}$-oxy enones can afford the corresponding tetrasubstituted carbon stereocenters in high diastereo- and enantioselectivity in the presence of standard BB catalysts. Experiments show that the $\alpha^{\prime}$-oxy ketone moiety plays a key role in the above realizations, as parallel reactions under identical conditions but using the parent $\alpha, \beta$ unsaturated ketones or esters instead proceed sluggish and/or with poor stereoselectivity. A series of trivial chemical manipulations of the ketol moiety in adducts can produce the corresponding carboxy, aldehyde, and ketone compounds under very mild conditions, giving access to a variety of enantioenriched densely functionalized building blocks containing a fully substituted carbon stereocenter. A computational investigation to rationalize the mode of substrate activation and the reaction stereochemistry is also provided, and the proposed models are compared with related systems in the literature.

## - INTRODUCTION

Catalytic asymmetric conjugate addition reactions account as one of the most useful and atom economic approaches for the construction of new $C-C$ and $C-X$ bonds stereoselectively. ${ }^{1}$ Major advances in the field have been triggered by the design and discovery of new chiral catalysts, both metal catalysts and organocatalysts, often in conjunction with the development of appropriate Michael acceptor templates. ${ }^{2}$ The templates not only should provide gained chemical versatility to the resulting conjugate addition adducts, but also should contribute to attain optimal performance by the intervening catalyst in terms of reactivity and stereoselectivity. Ideally, strongly biased achiral templates may override otherwise observed substrate-dependent catalyst behavior, thus attenuating undesired fluctuations on the catalyst efficiency. This aid from properly design templates may result instrumental when difficult transformations, such as the enantioselective generation of tetrasubstituted carbon stereocenters, are pursued.

Among several categories of Michael acceptors, $\alpha, \beta$ unsaturated carbonyl compounds are of prime synthetic significance. Adducts resulting from the conjugate addition of a nucleophilic reagent to $\alpha, \beta$-unsaturated aldehydes, ketones, or
carboxylic acid derivatives have all found a myriad of applications. In particular, certain carboxylic acid derivatives may afterward be converted into the corresponding aldehyde or ketone derivatives smoothly, making the former very versatile compounds. However, while both the addition reactions to $\alpha, \beta$ unsaturated aldehydes and to ketones are well suited for iminium ion activation catalysis, ${ }^{3}$ conjugate addition to the corresponding carboxylic acids and their derivatives is not. In this latter case, the most common activation mechanism relies upon coordination of the carbonyl group of the $\alpha, \beta$-unsaturated carboxylic acid derivative to a Lewis acid (metal catalysis) or a H -bond donor species (organocatalysis). In this context, several two-point binding enoyl templates bearing an additional coordinating site (X, Figure 1a) tethered to the enoyl system have been developed. Compared with monodentate templates, which may lead to two degenerate $\mathrm{C}=\mathrm{O} \cdots$ metal complex geometries, thus complicating stereocontrol, bidentate templates can form chelates upon coordination to the metal as key organizational/activation element. ${ }^{4}$ Similarly, bidentate enoyl

templates may perform superiorly in conjugate addition reactions triggered by bifunctional Brønsted base-H-bond catalysts, because of the likely occurrence of double H -bond interactions between the substrate and the catalyst (Figure 1a). ${ }^{1,5}$ This type of Brønsted base catalysis has emerged as very advantageous, not only because many Brønsted bases (BB) are commercially available and/or readily accessible, but also because the pronucleophilic reagent $(\mathrm{NuH})$ does not generally need to be preactivated in a separate step. ${ }^{6}$ However, successful BB-catalyzed enantioselective $C-C$ bond forming conjugate addition reactions are often limited to certain inherently reactive nucleophiles (particularly 1,3-dicarbonyl compounds) and/or electrophiles (particularly nitroalkenes), while in many other instances, $\alpha, \beta$-unsaturated esters being a notable example, sluggish reactivity or poor enantiocontrol is achieved. This situation becomes more problematic when generation of allcarbon quaternary stereocenters is pursued. ${ }^{8}$ Both reactivity attenuation by steric constraints and difficulties in controlling face selectivity in prostereogenic trisubstituted trigonal centers make this goal to be a hot topic yet.

In this study, we describe a new enoyl template model for asymmetric organocatalysis in which the bidentate substrate might engage as either H -bond donor or acceptor or both (ambivalency) during activation by the bifunctional catalyst (Figure 1b). As representatives of such a model, we show that $\alpha^{\prime}$-hydroxy enones perform exceedingly well in the Brønsted base-catalyzed asymmetric conjugate addition of a range of soft C-nucleophiles leading to tetrasubstituted carbon stereocenters in very high enantioselectivity. The chemical versatility of thus obtained adducts is also illustrated and a theoretical interpretation of the results provided.

## - RESULTS AND DISCUSSION

Background and Working Hypothesis. While being a prominent synthetic operation toward 1,5-dicarbonyl frameworks, successful catalytic and asymmetric methods for the constructive assembly of all-carbon quaternary centers from monodentate $\alpha, \beta$-enones are usually restricted to 1,3 dicarbonyl substrates and related active pronucleophiles. In this context, metal-catalyzed ${ }^{9}$ enantioselective conjugate addition of 1,3 -diketones, $\beta$-ketoesters, and $\alpha$-aryl cyanoesters to acrolein or vinyl ketones (mainly methyl vinyl ketone) as the

Michael acceptor have been reported by the groups of Ito, ${ }^{10}$ Shibasaki, ${ }^{11}$ Sodeoka, ${ }^{12}$ and Jacobsen, ${ }^{13}$ among others. ${ }^{9}$

In concurrent efforts under metal-free conditions, chiral Brønsted base-catalyzed conjugate additions of enolizable carbonyl compounds have also been explored after the pioneering work by Wynberg and co-workers. ${ }^{6,14}$ Deng and co-workers have reported conjugate additions of $\alpha$-substituted $\beta$-dicarbonyl compounds and $\alpha$-aryl cyanoacetates to acrolein or methyl vinyl ketone promoted by a bifunctional Cinchona based catalyst, ${ }^{15,16}$ while Jørgensen and co-workers documented the reaction of cyclic $\beta$-keto esters with both acrolein and methyl vinyl ketone using a nonbiaryl atropisomeric Cinchona-based catalyst. ${ }^{17}$ More recently, Rodriguez, Constantieux, and co-workers ${ }^{18}$ extended the Bronsted base catalysis approach to cyclic $\beta$-ketoamides as nucleophiles against methyl vinyl ketone. Notwithstanding these achievements, the realization of BB-catalyzed asymmetric conjugate additions involving more reluctant substrate combinations, such as less reactive enolizable carbonyl compounds and acryloyl equivalents, remains challenging. Thus, while some ester surrogates have been applied to Brønsted base-catalyzed conjugate addition reactions, ${ }^{5}$ to the best of our knowledge, only in three cases the generation of all-carbon quaternary centers has been documented. In a significant work, Dixon and Rigby ${ }^{5 m}$ described highly enantioselective conjugate additions of cyclic $\beta$-keto esters to naphthyl thioacrylate and $N$-acryloyl pyrrol, respectively, using a modified cinchona alkaloid as bifunctional Brønsted base catalyst. When acyclic keto esters were used as nucleophiles, yields and selectivity diminished, a limitation also noticed by Bartoli, Melchiorre and co-workers ${ }^{5 n}$ who used maleimides as competent Michael acceptors. Also, $\beta, \gamma$-unsaturated acyl phosphonates ${ }^{\text {5f }}$ have been reported to be effective enoate surrogates against reactive pronucleophiles including azlactones and 1,3-dicarbonyl compounds.

In the early 1980s Heathcock and co-workers demonstrated that $\alpha^{\prime}$-hydroxy ketones are convenient enoate equivalents in the context of aldol addition reactions, ${ }^{19}$ since oxidative cleavage of the ketol moiety in the corresponding aldol adducts affords $\beta$-hydroxy carboxylic acids. Focused on this observation, research from these laboratories has led to the development of metal-catalyzed conjugate addition and cycloaddition reactions of simple $\alpha^{\prime}$-hydroxy enones, ${ }^{20}$ as well as Brønsted acidcatalyzed Diels-Alder reactions of chiral $\alpha^{\prime}$-hydroxy enones, ${ }^{21,22}$ methods that provide, after cleavage of the ketol moiety, products in the carboxylic acid oxidation state. In these developments, the ability of the ketol moiety for both 1,4-metal and 1,4 -proton binding (Figure 2a) ${ }^{23}$ revealed to be critical for success. Based on these precedents, we hypothesized that the H -bonding ability of the ketol moiety in $\alpha^{\prime}$-hydroxy enones may decisively influence reactions initiated by a proton-transfer event, such as the BB-catalyzed Michael reactions (Figure 2b). ${ }^{24}$ Specifically, the substrate $\alpha^{\prime}$-hydroxy enone might participate as a two-point H -bond donor/acceptor (DAmodel) or acceptor/acceptor (AA-model) partner in the transition state, a diverting design element that is lacking in previous enoyl templates. ${ }^{5}$ To the best of our knowledge, $\alpha^{\prime}$ hydroxy enones have not been studied within the context of organocatalytic asymmetric bond-construction processes. ${ }^{25,26}$

Preparation of $\alpha^{\prime}$-Hydroxy Enones. The $\alpha$-oxy enones 1 and 3 were readily prepared ${ }^{27}$ from the addition of lithium methoxyallene 6 to acetone and 1,3-diphenylacetone 8 , respectively, and subsequent smooth one-pot hydrolysis of the resulting intermediates, as shown in Scheme 1. Scheme 1. Preparation of $\alpha^{\prime}$-Hydroxy Enones ${ }^{a}$

natively, enone 1 could also be prepared by the method of Connell et al., ${ }^{28}$ starting from the commercially available $\alpha$ hydroxy ketone 7 . In both cases, compound $\mathbf{1}$ was obtained in yields between the range $80-90 \%$ at 50 mmol scale. Preparation of 2 from 1 is straightforward and quantitative by silylation with commercial $N$-trimethylsilyl oxazolidin-2-one (TMSO). For $\beta$-substituted enones 5, the classical Horner-

Wadsworth-Emmons olefination protocol from the $\beta$-keto phosphonate 10 was used. This phosphonate was in its turn prepared from commercial hydroxyester 9. ${ }^{29}$ Likewise, for $\beta$ aryl substituted $\alpha$-hydroxy enones 4 ( $\mathrm{R}=\mathrm{Ar}$ ), an aldol condensation of 7 with benzaldehydes may also be employed. ${ }^{27}$

Conjugate Additions of 3-Substituted Oxindoles. To assess the reactivity profile of these $\alpha^{\prime}$-hydroxy enones in Brønsted base catalysis, our study was initiated with the reaction of $\alpha^{\prime}$-hydroxy enone 1 and 3 -substituted oxindoles. The oxindole structural motif is widely present within natural and synthetic bioactive molecules; ${ }^{30}$ however, Brønsted base promoted reaction of 3 -substituted oxindoles with alkyl vinyl ketones has met with limited success so far. ${ }^{31,32}$ For example, it has been reported that methyl vinyl ketone (MVK), ${ }^{31 a, b}$ ethyl vinyl ketone, ${ }^{31 a}$ and phenyl vinyl ketone ${ }^{31 a}$ all provided enantiomeric excess (ee) values in the range of $60-70 \%$ in the reactions with 3 -aryl oxindoles; the reactions with 3-methyl-, 3-isobutyl-, and 3-allyl oxindoles proceed with even lower ee's (of about 55\%). ${ }^{31 \mathrm{cc}}$ In addressing these issues, and after screening several Brønsted base catalysts, ${ }^{27}$ we found that the above addition reactions using $\mathbf{1}$, conducted in the presence of $10 \mathrm{~mol} \%(\mathrm{DHQD})_{2}$ PYR (C1), afforded the corresponding adducts 12 in excellent yields and enantioselectivities. As the data in Table 1 show, under these conditions $\left(-50{ }^{\circ} \mathrm{C}\right.$ in $\mathrm{CHCl}_{3}$ as solvent), oxindoles $11 \mathrm{~A}-\mathrm{F}$ bearing 3-aryl substituents with either electron donating or electron withdrawing groups are tolerated with almost equal efficiency. Oxindoles with substitution at the aromatic ring also provided adducts with excellent chemical and stereochemical results. Likewise, the 3 -methyl oxindoles $11 \mathrm{Ga}, 11 \mathrm{Gc}$, and 11 Gd , which are valuable precursors of natural products, vide infra, were competent reaction partners to give the respective adducts $12 \mathrm{Ga}, 12 \mathrm{Gc}$, and 12 Gd in good yields and enantioselectivities, typically $90 \%$ ee. Nevertheless, attempts to further expand this reaction to oxindoles bearing larger alkyl chains at the C3 position failed. Oxindoles $11 \mathrm{H}, 11 \mathrm{I}, 11 \mathrm{~J}, \mathbf{1 1 K}$, and 11 M all provided the corresponding adducts 12 with poor enantioselectivity, typically $50 \%$ ee. While these results seem to be quite common for reactions involving 3 -alkyl substituted oxindoles, very few attempts to address this deficiency have resulted with success. ${ }^{32}$ In fact, few catalytic systems work well for both aryland alkyl-substituted oxindoles. ${ }^{32 \mathrm{~d}}$ Given the ready availability of $\alpha^{\prime}$-hydroxy enones, we focused on the $\alpha^{\prime}$-disubstitution pattern as an additional element for steric tuning. We were pleased to observe that the enantioselectivity was notably increased, typically from $50 \%$ ee up to $90 \%$ ee, by using $\alpha^{\prime}$ hydroxy enone 3. As the results in Table 1 show, the reactions were tolerant with oxindoles bearing short, large, and ramified alkyl chains as well as alkyl chains with functional groups. These results are of special interest in that diverse functionality may be generated from a single common adduct. Thus, treatment of adducts 12Aa and 12 Gc with $\mathrm{NaIO}_{4}$ in $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ provided the corresponding carboxylic acids 14 in yields of $98 \%$ and $94 \%$, respectively, along with acetone as the only organic side product formed, Scheme 2. Alternatively, oxidative cleavage of adducts 13La and 13Oa, by treatment with periodic acid in this
 with dibenzyl ketone which could be recovered and reused. On the other hand, the addition of the corresponding Grignard reagent or reduction of the carbonyl group followed by diol cleavage as above furnished the methyl and aryl ketones 15/16 and the aldehyde 17, respectively, in good yields. Importantly, during the above manipulations, configurational integrity of

newly generated tetrasubstituted stereogenic carbons in adducts was untouched as determined for aldehyde 17Aa ( $94 \%$ ee) and acid 14 Gc ( $90 \%$ ee as determined in esermethole, vide infra). It is worth noting that the present method allows preparation of ketones such as 15 Ga and 16 Ga , formally derived from the less sterically demanding methyl-sustituted oxindoles, with enantioselectivities among the best reported until now. ${ }^{31}$

In addition, as far as we know, no asymmetric and catalytic conjugate addition of 3 -substituted oxindoles to acrylate esters or their surrogates have been developed yet. ${ }^{30,33}$ Our method may serve to remediate this deficiency by providing building blocks that can be easily transformed into biologically active compounds such as $(-)$-esermethole, Scheme $3,{ }^{34}$ an advanced
intermediate for the synthesis of $(-)$-physostigmine. ${ }^{35}$ Thus, Curtius rearrangement of carboxylic acid 14 Gc afforded carbamate 18, which upon treatment with $\mathrm{LiAlH}_{4}$ underwent reductive cyclization to ( - )-esermethole of $90 \%$ ee.

The key role played by the $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{COH}$ fragment of the template as a traceless activating group in the above reactions was clear from competitive experiments involving both 1 and methyl vinyl ketone (MVK), a simple enone lacking any group for additional H -bond coordination. Thus, when the reaction of oxindole 11Aa was carried out with a $1: 1$ mixture of 1 and MVK in the presence of $\mathbf{C 1}(10 \mathrm{~mol} \%)$ at $-50^{\circ} \mathrm{C}$, 12Aa was the exclusive addition product obtained, without detecting any product from the addition reaction of 11Aa to MVK. In

Scheme 2. Ketol Scission in Adducts 12

Scheme 3. Short Enantioselective Synthesis of (-)-Esermethole

another experiment, the reaction between oxindole 11Aa and MVK run at $-30^{\circ} \mathrm{C}$ in the presence of $\mathbf{C 1}$ led, after 48 h , to $35 \%$ conversion only, with an isolated product of $50 \%$ ee.

Conjugate Additions of Cyanoacetates. Encouraged by these results, we next investigated the reaction of $\alpha^{\prime}$-hydroxy enones with $\alpha$-substituted cyanoacetates. ${ }^{36,37}$ The problems experienced in achieving efficient chirality transfer in metal catalyzed conjugate additions with these pronucleophiles have been ascribed to the fact that cyanoacetates are incapable of two-point binding. ${ }^{38}$ We reasoned that the capacity of $\alpha^{\prime}$ hydroxy enones for two-point binding (Figure 2) may ameliorate this deficiency. Indeed, we found that 1 was effective in the Brønsted base catalyzed reaction with not only $\alpha$-aryl, but also $\alpha$-alkyl cyanoacetates, a subclass of substituted cyanoacetates previously documented to be poorly reactive substrates, ${ }^{37}$ particularly against alkyl vinyl ketones. ${ }^{37 \mathrm{a}}$ After evaluation of a survey of different Brønsted bases, including C1, the squaramide family of catalysts pioneered by Rawal and co-workers ${ }^{39}$ probed the most effective in these instances. Among them, catalyst C2 ${ }^{40}$ (Figure 3) resulted optimal for the reaction between 1 and a range of both $\alpha$-aryl and $\alpha$-alkyl tert-butyl cyanoacetates 19. In general, the reaction with $\alpha$-aryl cyanoacetates $19 a-d$ was performed at room temperature using 3 equiv of enone 1 to afford, after 1 h , adducts 20a-d with excellent yields independently of the nature of the aromatic ring substitution. In contrast, most $\alpha$ alkyl cyanoacetates tested showed decreased reactivity with reaction times of about 120 h required for complete conversion under the above conditions. However, by using 3 -fold excess of the latter and rising the temperature to about $50^{\circ} \mathrm{C}$, full conversions of products $19 \mathrm{e}-\mathrm{k}$ were attained within about 30 h

Figure 3. Catalysts employed within this work.
or less, with very high yields of isolated product and essentially perfect enantioselectivity obtained. Again, chemical manipulation of the ketol unit in adducts 20 using simple Grignard technology and/or reduction/oxidation protocols, as in Scheme 2, provided a straightforward entry to the corresponding carboxylic acids 21, aldehydes 22, and ketones 23/24. Comparison of optical rotation value of product 23e (see Table 2, footnote b) with literature data ${ }^{10}$ served to set the configuration of the products and hence the stereochemical course of the above catalytic reactions. As noted above enantioselective synthesis of products like 21-24 through direct catalytic Michael reactions remains challenging. Once more, the design enone $\mathbf{1}$ demonstrated to be instrumental in achieving these levels of reactivity and selectivity. For example, when an equimolar mixture of cyanoacetate 19a, enone 1 , and MVK was stirred at $20^{\circ} \mathrm{C}$ for 30 min in the presence of 10 mol \% C2, a 12:1 mixture of 20a and the addition adduct from MVK, respectively, was obtained. Likewise, parallel reactions of other typical Michael acceptor templates, i.e. N-acryloyl oxazolidinone or $N$-acryloyl pyrazole, with cyanoacetate 19 e under the above conditions were sluggish (less than 55\% conversion after 120 h at room temperature for the two cases).

Conjugate Additions of Heteroatom-Bearing Soft Carbon Nucleophiles. Besides all-carbon quaternary stereocenters, tetrasubstituted stereogenic carbons bearing a sulfur, oxygen or nitrogen heteroatom are also interesting yet difficult products to obtain as single enantiomers. Therefore, we decided to investigate the capacity of our template model to participate in Brønsted base-catalyzed conjugate additions of several heteroatom-bearing soft carbon nucleophiles. For this study 5 H -thiazol-4-ones $25^{41}$ and 5 H -oxazol-4-ones $26^{42,43}$ were initially selected and we found that reaction of thiazolone 25a and oxazolone 26a with $\alpha^{\prime}$-hydroxy enone 1 did proceed in the presence of several Brønsted bases, including C1 and C2, but with very poor enantioselectivity. Further exploration led us to examine the modified enoyl template 2 , prepared by simple silylation of the hydroxyl group in enone 1. To our pleasure, the reaction of 5 H -thiazol-4-ones 25 and enone 2 catalyzed by $\mathbf{C} 2$ in dichloromethane at $-20^{\circ} \mathrm{C}$ provided, after desilylation of the resulting intermediates, the corresponding addition products 27 in good yields and ee's up to $98 \%$. The parent 5 H -oxazol-4-ones 26 participated with equal chemical efficiency in the reaction with enone 2 . For example, under the above conditions, 26a provided 28a in $85 \%$ yield albeit in $73 \%$ ee.

Table 2. Conjugate Addition of $\alpha$-Substituted tert-Butyl Cyanoacetates 19 to $\alpha^{\prime}$-Hydroxy Enone 1 Promoted by C2 ${ }^{a}$

${ }^{a}$ The reactions were performed on a 0.30 mmol scale in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at 20 ${ }^{\circ} \mathrm{C}$ or in $\mathrm{CHCl}_{3}$ at $50{ }^{\circ} \mathrm{C}$. Yield of isolated major isomer after chromatography. ee determined by HPLC. ${ }^{b}[\alpha]_{\mathrm{D}}{ }^{22}=+3.9 \quad(c=1$, $\left.\mathrm{CHCl}_{3}\right)$; lit. ${ }^{10}[\alpha]_{\mathrm{D}}{ }^{20}=+2.7\left(c=5, \mathrm{CHCl}_{3}, 81 \% \mathrm{ee}\right)$.

This result was further improved by using catalyst $\mathbf{C} 3^{44}$ (Figure 3 ), and the reaction between 2 and oxazolone 26a performed at room temperature afforded, after desilylation of the resulting intermediate, adduct 28a in $80 \%$ yield and $93 \%$ ee.

In general, excellent yields and enantioselectivities were achieved for a survey of thiazolones and oxazolones bearing either short, large, or ramified alkyl chains at the heterocyclic ring (Table 3). While these reactions were typically carried out in the presence of $20 \mathrm{~mol} \%$ of catalyst, the catalyst loading could be reduced to $10 \mathrm{~mol} \%$ provided the reactions were carried out at higher temperature. For example, products 28a and $\mathbf{2 8 b}$ were obtained in essentially same chemical yields and stereoselectivities as above when the corresponding reactions were performed in $\mathrm{CHCl}_{3}$ at $40^{\circ} \mathrm{C}$ during 30-40 h. Clearly, these results show that the $\alpha^{\prime}$-hydroxy enone template may be easily modified to better adapt to different substrate/catalyst combinations.

Transformation of adducts 27 and 28 into the corresponding carboxylic acids 29, 30, 32, and 33, Scheme 4, was easily achieved by treatment with periodic acid in the case of thiazolone adducts 27 , and with cerium ammonium nitrate

Table 3. Conjugate Addition of 5 H -Thiazolones 25 and 5 H Oxazolones 26 to $\alpha^{\prime}$-Silyloxy Enone $2^{a}$

${ }^{a}$ The reactions were performed on a 0.30 mmol scale in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 0.9 mL ) using 1.5 equiv of enone 2 . Scheme 4. Elaboration of Thiazolone and Oxazolone Adducts 27 and 28

(CAN) in the case of oxazolones 28. Subsequent transformation of adduct 30 into the thiolactone 31, as well as adduct 33 into the lactone derivative 34 , by simple ring opening under mild acid and/or basic conditions, illustrates the utility of the method. In addition, formation of known lactone $35^{45}$ from 34 served to establish the stereochemical course of the reactions. It should also be noted that both 25a and 26a upon treatment with either methyl acrylate or tert-butyl acrylate under the above conditions did not provided the corresponding Michael adducts.

Further exploration of the broad scope of $\alpha$-silyloxy enone 2 showed that $\alpha$-substituted azlactones, 4 H -oxazol- 5 -ones, also fit well. For example, Table 4, the reaction between azlactones 36 and enone $\mathbf{2}$ in the presence of the catalyst C2 or C3 led, after desilylation of the intermediate adducts, to the corresponding products 37 with good yields and ee's. In each case, reactions proceeded with high site selectivity and no products from

37d (77\%, 90\% ee)
${ }^{a}$ The reactions were performed on a 0.30 mmol scale in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.6$ mL ) using 3.0 equiv of enone 2. Yield of isolated products after chromatography. ee determined by HPLC. In parentheses are ee's from catalyst C3 ( $10 \mathrm{~mol} \%$ ).
reaction at the $C_{2}$-position of the azlactone ring were observed. ${ }^{46}$

Elaboration of thus obtained azlactone adducts afforded useful building-blocks. For instance, Scheme 5, azlactone ring

Scheme 5. Elaboration of Adducts to $\alpha, \alpha$-Disubstituted Glutamic Acid Derivatives

opening in $37 \mathbf{b}, \mathbf{c}$ to afford the corresponding compounds 38 and 39, and subsequent ketol elaboration, provided acids 40 and 41, respectively. The former was then transformed into the known glutamic acid derivative $42^{47}$ as a proof of the stereochemical course of the catalytic reaction.

Reactions with $\beta$-Substituted $\alpha$-Oxy Enones: Generation of Adjacent Quaternary/Tertiary Stereocenters. Given the results attained with the $\alpha$-oxy vinyl ketones 1 and 2, we wondered whether this template model would be effective to generate a quaternary carbon adjacent to a tertiary stereogenic center, a synthetic task that generally presents added difficulties. To this end, we selected the reaction of $\alpha$ substituted cyanoacetates owing to the inherent challenges associated with this kind of pronucleophiles, vide supra. In this context, Peters has recently addressed this issue and provided a solution to the case of reactions involving cyclic enones, that is, cyclohexenone, using metal catalysis. ${ }^{38 \mathrm{a}}$ On the other hand, only one example of Michael reaction of $\alpha$-substituted cyanoacetates with $\beta$-substituted alicyclic enones has been documented, based on salen complex catalysis. ${ }^{38 \mathrm{~d}}$
It was gratifying to observe that $\alpha$-aryl cyanoacetates $19 \mathbf{a}-\mathbf{d}$ and 191 reacted with $\beta$-alkyl substituted $\alpha$-hydroxy enones 4A-

E to furnish adducts $43-47$ in good yields, Table 5. The reactions were carried out in 1,2-dichloroethane at $40^{\circ} \mathrm{C}$, and

Table 5. Conjugate Addition of Cyanoacetates to $\beta$ Substituted $\alpha$-Hydroxy Enones ${ }^{a}$

${ }^{a}$ The reactions were performed on a 0.30 mmol scale in 1,2-DCE (1.2 mL ) using 3.0 equiv of enone 4 , at $40^{\circ} \mathrm{C}$ otherwise stated. generally essentially one diastereomer was produced in excellent enantiomeric excess. As exceptions, $\beta$-substituted enones 4 F and $\mathbf{4 H}$, bearing the cyclohexyl and phenyl groups, respectively, were ineffective under these conditions, while 4G provided 48a in good yield but diminished stereoselectivity. On the other hand, $\alpha$-alkyl cyanoacetates were unreactive and did not provide the corresponding adducts. Despite these limitations, which, in their turn, confirm the difficulties associated with these problematic pronucleophiles, the method represents the first Michael addition of $\alpha$-substituted cyanoacetates to $\beta$-alkyl enones catalyzed by a chiral Brønsted base, and confirms once more the excellent behavior of $\alpha^{\prime}$ hydroxy enones as Michael acceptors. In this respect, while no reaction was observed from 19a, 19c, and 19d with methyl 5-phenylpent-2-enoate in the presence of $\mathbf{C} 2$, oxidative cleavage of 43a, 43c, and 43d provided the desired carboxylic acids 4951. We also examined the $\mathbf{C} 2$ catalyzed reaction between cyanoacetate 19a and trans-3-nonen-2-one 52, which lacks the $\alpha^{\prime}$-hydroxy group (Scheme 6). The reaction proceeded, but required 7 days to reach $95 \%$ of conversion and the product was formed as an 80:20 mixture of diastereomers with only modest enantioselectivity for the major isomer 53. In sharp contrast, the reaction between 19 a and $\alpha^{\prime}$-hydroxy enone 4 E , as

Scheme 6. Conjugate Addition of $\boldsymbol{\alpha}$-Substituted
Cyanoacetates to Simple Enones and an Indirect Solution to the Low Inherent Stereoselectivity

mentioned above, gave 46a as essentially single diastereomer in $94 \%$ ee (Table 5), which enables an alternative and highly stereoselective entry to product 53 via usual alkylation and oxidative scission. Similarly, 45a could be converted into the methyl ketone 54 and, upon subsequent transesterification, the corresponding methyl ester 55, which exhibited essentially identical ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra to those reported in the literature, ${ }^{38 \mathrm{~d}}$ but opposite optical activity, thus confirming the stereochemical assignments for the adducts.

Oxazolones 26 also participated in the reaction with $\beta$ substituted enones 4 to give the corresponding $\alpha, \alpha$ disubstituted $\alpha$-hydroxy acid precursors with an adjacent tertiary stereocenter, Table 6. However, in contrast to the case of cyanoacetates noted above, the reactions of oxazolones 26 worked well only with $\beta$-aryl enones to afford the corresponding addition products 56. The reactions with $\beta$ alkyl enones were unproductive and the starting materials could be recovered unchanged. From these results, it is clear that for these types of substrate combinations leading to adjacent quaternary/tertiary stereocenters, there might be strong steric interactions that may justify the observed variability. Configuration of adduct $\mathbf{5 6 J c}$ c was established by a single crystal X-ray analysis and that of the remaining adducts by assuming a uniform reaction mechanism. Additionally, conversion of 56 into the carboxylic acids $\mathbf{5 7}$ and $\mathbf{5 8}$ could be accomplished by using CAN as the optimum oxidant.

Computational Studies. With these experimental data in hand, it seemed clear that $\alpha^{\prime}$-oxy enones exhibit some unique reactivity as compared with ordinary enones, that is, MVK. Both higher reactivity and improved levels of enantioselectivity are observed in the BB-catalyzed reactions studied. Similarly, our experimental results indicate a distinct behavior of $\alpha^{\prime}$-oxy enones as compared with other typical enoyl templates previously reported for the BB-catalyzed enantioselective generation of quaternary stereogenic carbon centers. More specifically, the catalyst-controlled conjugate addition of $\alpha$ substituted cyanoacetates is, as mentioned before, sluggish with the majority of Michael acceptors, while it works well with $\alpha^{\prime}$ oxy enones. With the aim to bring some light on such distinguishing behavior, we decided to study computationally ${ }^{48}$ the case of the conjugate addition reactions of cyanoacetates. MVK and the two $\alpha^{\prime}$-oxy enones $\mathbf{1}$ and $\mathbf{5 9}$ were selected as the model Michael acceptors, and the relationship between their

Table 6. Conjugate Addition of Oxazolones to $\boldsymbol{\beta}$-Substituted $\alpha$-Hydroxy Enones ${ }^{a}$

${ }^{a}$ The reactions were performed at $70{ }^{\circ} \mathrm{C}$ on a 0.15 mmol scale in dichloroethane ( 0.45 mL ) using 3.0 equiv of enone 4 . Yield of isolated products after chromatography. reactivity and structure was examined first. In agreement with our working hypothesis, calculations show that the intramolecular H-bond activation in $\mathbf{1}$ and 59 induces a change in a series of electronic parameters (Figure 4), explaining their higher reactivity in comparison with MVK. In particular, the electrophilicity index $\omega^{49}$ for both $\mathbf{1 / 5 9}(2.0 \mathrm{eV})$ is higher than that for MVK $(\omega=1.6 \mathrm{eV})$, which is consistent with the lower energy of LUMO for $\mathbf{1}$ and $59(-1.9 \mathrm{eV})$ as compared with the LUMO of MVK ( -1.5 eV ), and also the more positive

character of the $\beta$-carbon of $\mathbf{1}$ (NPA charge of -0.31 ) than the corresponding $\beta$-carbon of MVK ( -0.34 ). These values correlate well with the Wiberg bond index for 1 (1.90) and MVK (1.92), respectively, indicating the diminished double bond character of the enone $\mathrm{C}=\mathrm{C}$ bond in $\mathbf{1}$.

Subsequently, the activation energy of the reaction of these three Michael acceptors with methyl $\alpha$-methylcyanoacetate was computed. This barrier resulted significantly lower for $\alpha^{\prime}$ hydroxy enone $1(11.1 \mathrm{kcal} / \mathrm{mol})$ than for MVK ( $17.7 \mathrm{kcal} /$ mol ). On the other hand, although the electronic parameters of both $\alpha^{\prime}$-hydroxy enones 1 and 59 do not differ significantly from one another (see above), the reaction involving the latter presents an activation energy $4.4 \mathrm{kcal} / \mathrm{mol}$ higher than the reaction with 1 . This additional stabilization of the transition state (TS) for the reaction with 1 as compared with 59 is consistent with the shorter intramolecular hydrogen bond in the former case ( 1.69 vs $1.83 \AA$, Figure 1) and might be ascribed to a favorable Thorpe-Ingold effect ${ }^{50}$ imparted by the two geminal methyl substituents in 1 .

The origin of the stereoselectivity in the C2-catalyzed reaction between hydroxy enone 1 and $\alpha$-cyanoacetates was addressed next, and the first question to elucidate was the preferred H -bond pattern formed between the catalyst and both substrates in the TS corresponding to the $C-C$ bondforming step. In this respect, up to (at least) three different ternary complexes (A-C, Figure 5) have been proposed for

Figure 5. Three alternative substrate-catalyst combinations.
reactions involving noncovalent cooperative activation of the intervening nucleophile and electrophile, typically by a bifunctional thiourea (or squaramide)-tertiary amine catalyst. ${ }^{51}$ Therefore, the question of whether or not a unified H -bond network model (A, B, C, other) could be applied to different reactions within this catalysis category seems to be still open and more data are desirable. In our case, we computed the reaction leading to adduct $\mathbf{2 0 e}$ (Table 2), and despite much effort we were unable to find any plausible transition structure of type B among the several H -bond combinations studied. ${ }^{52}$ From a look to the geometries of the resulting complexes, it seemed that once cyanoacetate is H -bonded to the catalyst there is not space available for the electrophile to interact with the same catalyst molecule. Thus, the structure closest to $\mathbf{B}$ we could find involves attack of the H -bonded cyanoacetate anion to the non complexed enone. ${ }^{53}$ On the other hand, a single
structure similar to model C was also found; however, it was predicted to be unrealistic due to its high activation energy.

In its turn, four feasible structures of type A (TS-R $\mathbf{R}_{1}$, TS-S $\mathbf{S}_{1}$, TS-R $\mathbf{R}_{2}$, TS-S ${ }_{2}$, Figure 6) were located, in which the $\alpha^{\prime}$-hydroxy

enone carbonyl is double H -bonded to the squaramide NH groups, while the protonated quinuclidine $\mathrm{NH}^{+}$might bind to either the CN or the ester group of the cyanoacetate moiety. TS- $\mathbf{R}_{1}$ is the lowest in energy and correctly explains the formation of the major isomer observed experimentally. ${ }^{54}$ The next most feasible structure is TS- $\mathbf{S}_{1}$. Interestingly, in both cases, the $\mathrm{CO}_{2}{ }^{t} \mathrm{Bu}$ is involved in H -bonding with the catalyst $\mathrm{NH}^{+}$moiety, while the methyl (TS-S $\mathbf{S}_{1}$ ) and the cyano group (TS- $\mathbf{R}_{\mathbf{1}}$ ) are, respectively, almost eclipsed with the enone double bond. The energy difference between these two structures is $2.8 \mathrm{kcal} / \mathrm{mol}$ at the $\mathrm{M} 06-2 \mathrm{X} / 6-311+\mathrm{G}^{* *}$ computational level, ${ }^{55}$ with the preference of TS- $\mathrm{R}_{1}$ being attributable to a larger destabilizing effect of pseudoeclipsed methyl (dihedral angle $21.9^{\circ}$ ) than pseudoeclipsed cyano (dihedral angle $33.5^{\circ}$ ). The remaining two structures, TS- $\mathbf{R}_{2}$ and TS-S 2 , both involving a $\mathrm{NH}^{+} \ldots \mathrm{NC}$ interaction, lye 6.1 and $6.4 \mathrm{kcal} / \mathrm{mol}$ higher in energy than TS-R ${ }_{1}$, respectively. From these results, some tentative conclusions may be drafted: (i) in the studied catalytic reactions, the ketol moiety of the acceptor $\alpha^{\prime}$-hydroxy enone plays a key role in both decreasing reaction energy barriers; (ii) among the several possible H -bond combinations for the ternary nucleophile-catalyst-electrophile complex, type $\mathbf{A}^{51 a-e}$ is preferred, with the squaramide group interacting with the $\alpha^{\prime}$ hydroxy enone (electrophile activation), and the protonated quinuclidine interacting with the cyanoacetate anion (nucleophile activation); (iii) given previous data in the literature in favor of models of type $\mathbf{B}^{51 \mathrm{f}-\mathrm{k}}$ and $\mathbf{C}^{511}$ for related catalytic reactions, we believe that a unified model cannot accommodate
well for all reactions falling within this type of noncovalent bifunctional catalysis, and case to case analysis is required; (iv) calculations for our system confirms that H -bond with a nitrile group contributes poorly to TS stabilization as compared with H-bond to a ester group, probably due to the fact that linear arrangements, as in $\mathrm{C} \equiv \mathrm{N} \cdots \mathrm{HX}$, are more difficult to fit in the TS than angular arrangements, as in $\mathrm{C}=\mathrm{O} \cdots \mathrm{HX} .{ }^{56}$ Eventually, the combination of these factors leads to the highly stereoselective formation of the new quaternary stereocenter in 20e.

## CONCLUSIONS

In summary, the highly stereoselective generation of tetrasubstituted carbons, including $C-N, C-O, C-S$, and all-carbon quaternary stereocenters, has been realized via bifunctional Brønsted base catalyzed Michael reaction of various types of hitherto challenging prostereogenic $C$-nucleophiles and $\alpha^{\prime}$-oxy enones as key enoate surrogates. Competitive and parallel experiments using simple enones (or esters) and the respective $\alpha^{\prime}$-oxy enones indicate that the $\alpha$-oxy ketone moiety is crucial for achieving high levels of reactivity and stereoselectivity. The ability of $\alpha^{\prime}$-hydroxy enones to engage in H -bond networks as either donor or acceptor component (or both) was unknown in previous bidentate enoyl templates, and may in the future be exploited as a new design element in other organocatalytic asymmetric transformations. An additional noteworthy aspect of this design is that the gem-dialkylcarbinol framework of the template can be easily modified at both the carbon and oxygen sites, thus enabling easy template tuning for optimal performance. The resulting $\alpha$-oxy ketone adducts can smoothly be converted into the corresponding aldehyde, ketone, or carboxylic acid derivatives through simple oxidative cleavage of the ketol unit. The present methodology thus provides access to synthetically relevant building-blocks bearing a fully substituted stereogenic carbon atom which were hitherto difficult to prepare in enantioenriched form. Studies toward broadening this methodology are currently underway.

(52) In our calculations we have considered the chiral cinchonine moiety of $\mathbf{C} 2$ addopting either syn-open or anti-open conformations. The prevalence of such conformations in similar bifunctional catalysts as well as in the native Cinchona alkaloids has been studied both experimental and theoretically: (a) Hammar, P.; Marcelli, T.; Hiemstra, H.; Himo, F. Adv. Synth. Catal. 2007, 349, 2537-2548. (b) Dijkstra, G. D. H.; Kellogg, R. M.; Wynberg, H. Recl. Trav. Chim. Pays-Bas 1989, 108, 95. (c) Dijkstra, G. D. H.; Kellogg, R. (53) While the intramolecular H-bond present in our $\alpha^{\prime}$-hydroxy enone would help the occurrence of such a transition state, its energy is exceedingly high and this pathway may be discarded.
(54) Extrapolation of this TS model to the case of the reaction between $\beta$-substituted enones 4 and cyanoacetates 19 would also correctly predict the $(S, S)$ relative configuration of adducts obtained in Table 5. In contrast, the structure closest to $\mathbf{B}$ we could find predicts products of wrong relative stereochemistry upon a similar extrapolation.
(55) Zhao, Y.; Truhlar, D. G. Theor. Chem. Acc. 2008, 120, 215-241.
(56) It seems that the preference of the nitrile versus the ester group to get coordinated to a metal center does not correlate with the ability of each group for engaging in H-bonding. Thus, most TS models invoked in the literature for the metal-catalyzed conjugate addition reactions of $\alpha$-cyanoacetates consider metal-coordinated nitrile and uncoordinated ester groups, respectively (see refs 10, 38a, 38b, 38h, and 38 i ). In contrast, and in agreement with our own calculations, previously reported qualitative activation models for related reactions involving H -bond catalysis assume the preference of the ester group over the nitrile for H -bonding (see refs $37 \mathrm{a}, 37 \mathrm{f}$, and 37 i ). To further illustrate this divergency, the structure of a cyanoacetate-metal catalyst complex has been elucidated (reference 38i) in which both the metal-CN and the ester-H-bond interactions are identified.

    ${ }^{229}$ While the intramolecular $H$-bond present in our $\alpha$ '-hydroxy enone would help the occurrence of such a transition state, its energy is exceedingly high and this pathway may be discarded.

[^62]:    ${ }^{231}$ It seems that the preference of the nitrile versus the ester group to get coordinated to a metal center does not correlate with the ability of each group for engaging in H -bonding. Thus most TS models invoked in the literature for the metal-catalyzed conjugate addition reactions of $\alpha$-cyanoacetates consider metalcoordinated nitrile and uncoordinated ester groups, respectively, In contrast, and in agreement with our own calculations, previously reported qualitative activation models for related reactions involving H -bond catalysis assume the preference of the ester group over the nitrile for H-bonding. To further illustrate this divergency, the structure of a cyanoacetate-metal catalyst complex has been elucidated in which both the metal- CN and the ester-H-bond interaction are identified.
