## ORGANOCATALYTIC $\alpha$-FUNCTIONALIZATION OF CARBONYL COMPOUNDS: CHEMO-, REGIO- AND STEREOSELECTIVITY

## Summary

Many natural products and bioactive substances bear a stereogenic center adjacent to a carbonyl group. Therefore, great efforts have been made to develop stereocontrolled methods for the preparation of such structural motifs with a predefined configuration. One of the main approaches consists on the stereocontrolled addition of an enolate or equivalent species to a suitable electrophile. This approach is extremely versatile due to the array of procedures available for the formation of enolate equivalents and the set of electrophiles amenable for the reaction.

The addition of enolizable carbonyl compounds to propargylic imines, aldehydes or ketones is an interesting reaction owing to the synthetic versatility of the acetylenic adducts formed. Nevertheless, both propargyl imines and aldehydes/ketones have remained mostly overlooked in this context. Our group has employed these electrophiles in the direct aldol and Mannich reactions for the first time. In both reactions, the catalyst developed in the group (see Scheme A) together with participation of a Brønsted acid cocatalyst are key for the reactions via enamine to proceed smoothly and in high stereoselectivity.

Scheme A

In this Doctoral Thesis it has been studied, on the one hand, the particular case of the use of $\omega$-unsaturated aldehydes as donors in the aldol reaction mentioned above and the subsequent Pauson-Khand reaction of the resulting 1, $\omega$-enynes (Scheme Ba). On the other hand, the behaviour of alkynyl ketones (ynones) as acceptors in such aldol reactions has also been studied (Scheme Bb ).
a) Aldol reaction of $\omega$-unsaturated enolizable aldehydes with ynals

b) Aldol reaction of enolizable aldehydes with ynones

Scheme B

In a second chapter of this Doctoral Thesis, new catalytic systems based on Brønsted bases (BB) for the stereoselective generation of new tetrasubstituted carbon stereocenters have been studied. Based on previous results in our group using $\alpha^{\prime}$-oxy enones as acrylate equivalents in metal-catalyzed processes, their use as Michael acceptors in Brønsted base-catalyzed enantioselective processes has been studied. Specifically, the conjugate addition of oxazolones has been investigated, for which catalysts shown in Scheme C happened to be the optimal ones. Three situations have been addressed: a) addition to the unsubstituted enone (the $O-\mathrm{SiMe}_{3}$ derivative resulting superior), b) addition to $\beta$-substituted enones, where not only the attenuated reactivity, but also the control of both contiguous stereogenic centers formed should be addressed, and c) addition to $\alpha$-substituted hydroxyenones, in which case the control of diastereoselectivity during the generation of two non-adjacent stereocenters must be addressed. It should be noted that only scarce direct asymmetric methods exist for the access to this type of structures.

cat:

Scheme C

After the good results obtained with the $\alpha$ '-hydroxy enone as Michael acceptor, the corresponding conjugated $\alpha^{\prime}$-hydroxy dienones have been studied with the aim to ascertain to which extent both the stereoselectivity, and the regioselectivity (1,4addition vs. 1,6-addition) of the process could be controlled. For this purpose, new chiral guanidine and phosphanimines were synthetized, which happened to efficiently control the regioselectivity, but not stereoselectivity (Scheme D).

Scheme D

In a third chapter of this Thesis, the behaviour of vinylogous ketone enolates generated under catalytic conditions has been studied. Our laboratory has found that these ketones react in a highly regioselective manner with nitroalkenes and vinylsulfones through $\mathrm{C}_{\alpha}$ in the presence of certain Brønsted bases, in contrast to most precedents in the literature, that describe reactions through $\mathrm{C}_{\gamma}$ (Scheme E). By this way adducts with two new contiguous stereocenters are accessible in high control, and can be subsequently elaborated in diverse ways.

Scheme E.

In this Thesis, the method has been successfully extended to $\alpha$-branched cyclic ketones giving access to the corresponding $\alpha, \alpha$-disubstituted (quaternary) ketones in good yield and overall high selectivity. The method was demonstrated to be robust, admitting cycloalkanones with different ring-sizes $(\mathrm{n}=0,1,2,3)$ and constituting a significant advance on scope (Scheme F).

## Scheme F

In the same context, the completely regio- and stereoselective functionalization of $\alpha$-substituted $\beta$-tetralones through the bifunctional Brønsted base-catalyzed Michael reaction with nitroalkenes and addition to azodicarboxylates have been achieved (Scheme G). The absence of previous direct and catalytic methods for this transformation should be noted.

Scheme G

During the last part of this Thesis a short stay was performed in the group of Prof. Jonathan Clayden in the School of Chemistry of the University of Bristol, in which routes to the synthesis of arogenate from the natural amino acid L-tyrosine have been studied (Scheme H). Arogenate is a direct precursor of aromatic amino acids in the metabolism of certain plants and its derivatives are potential selective herbicides. However, only scarce procedures for its synthesis exist to date.

## Scheme H

## Abbreviations and acronyms

| AAA | Aromatic amino acid |

1.3.Limitations and general objectives. ..... 42

## Introduction

## 1.1. $\alpha$-Substituted carbonyl compounds

Molecules containing carbonyl groups with an adjacent stereocenter are widespread within natural products and biologically active compounds, like the ones depicted in Figure 1. ${ }^{1}$ Therefore, methods capable of accessing such moieties in high selectivity are most sought after.

Aldosterone (Human hormone)

Chlorogenic acid
(Intermediate in the lignin biosynthesis)

Phenoxymethylpenicillin
(Antibiotic)

(-)-Spirobrassinin (Antitumoral agent)

Carbidopa
(Antiparkinsonian agent)

Figure 1.

Three main approaches for the stereoselective formation of a stereogenic center in the $\alpha$-position of a carbonyl compound are shown in Scheme 1. Among them, the present thesis is focused on approach c), that is, reaction of an electrophile with an enolate anion or equivalent under proton transfer conditions.

[^0]

b)

Scheme 1.

Approach c) is extremely versatile owing to three main aspects among others: ${ }^{2}$ i) there are several procedures to generate enolate equivalents (Figure 2); ii) enolates and equivalents are highly nucleophilic, so they can react with a variety of electrophiles; and iii) the approach is well suited for the generation of two contiguous stereocenters when both nucleophile and electrophile are prostereogenic.

## Figure 2.

Two main approaches, namely the use of chiral auxiliaries and catalytic methods, are suitable strategies to control the stereogenical outcome of the reactions leading to a carbonyl compound with an $\alpha$-stereocenter.

As usual, initial developments in this area were based on the use of covalently bound chiral auxiliaries. Chiral auxiliaries must be capable of transferring the chiral information during the new bond formation event and easily cleavable from the obtained adducts for the procedure to be practical.

Chiral secondary amines were among the first chiral auxiliaries developed for this endeavour, which upon condensation with ketones and aldehydes form enamine

[^1]intermediates with enhanced nucleophilicity. In 1969 Yamada et al. ${ }^{3}$ reported the first examples in a series of investigations on the alkylation of chiral enamines derived from L-proline esters. With this methodology, the products of the formal addition of cyclohexanone to methyl acrylate and acrylonitrile, as well as from the reaction with strongly electrophilic alkyl halides were obtained, although unfortunately, with very low yields (<25\%) and $e e$ values ( $<60 \%$ ). Subsequent work by other groups identified other chiral amines that performed superior for different asymmetric alkylations. These developments were focused on cyclohexanone-derived enamines as substrates almost exclusively (Figure 3).

Figure 3.

Hydrazines are another functional group that can condense with aldehydes and ketones, leading to the formation of hydrazones, which are good nucleophiles upon deprotonation. ${ }^{8}$ In this context, Enders ${ }^{9}$ explored in depth the usefulness of chiral hydrazones derived from (S)-1-amino-2-methoxymethylpyrrolidine for the $\alpha$ functionalization of aldehydes and ketones (Figure 4).

[^2]

Figure 4.

A different strategy to achieve the asymmetric $\alpha$-functionalization of carbonyl compounds is the use of chiral ligand-bearing metal enolates as nucleophilic intermediates. An advantage of this approach compared to enamine- and hydrazonemediated approaches is that not only aldehydes and ketones, but also carboxylic acid derivatives such as esters and thioesters can be used as enolizable substrates. As representative examples of this strategy, some boron ligands employed in chiral ligand mediated enolate reactions are shown in Figure 5. ${ }^{10}$

Figure 5.

[^3]For substrates in the carboxylic acid oxidation state, a chiral auxiliary can be covalently bound to the acyl system. Upon enolization, subsequent reaction with an electrophile would be controlled by the auxiliary intramolecularly (diastereoselective process). One advantage of this method is that the removal of the chiral auxiliary can afford either carboxylic acid derivatives, aldehydes or ketones depending on the scission conditions employed, thus giving access to a broad variety of products from a common optically active intermediate (or adduct).

In 1981, Evans and coworkers ${ }^{15,16}$ reported the use of chiral oxazolidinones as auxiliaries for the asymmetric formation of a stereogenic center in the $\alpha$-position of acyl systems via alkylation and aldol-type reactions. Following this ground marking work, many other chiral auxiliaries ${ }^{23-21}$ were reported for different reactions leading to $\alpha$ stereogenic carboxylic acid derivatives (Figure 6). ${ }^{23}$

atom and step economy. Asymmetric catalytic procedures, in which a substoichiometric amount of a chiral inductor is enough to accomplish the reaction with high chemo-, regio- and stereoselectivity, are more convenient from the point of view of atom economy and procedural simplicity. ${ }^{24}$

Procedures based on the use of previously generated (preformed) enolates or enolate equivalents, namely directed methods, in combination with a chiral Lewis acid catalyst have been studied in depth. Among them, silyl enol ethers are by far the most prominent, and their addition reaction to carbonyl compounds, namely the Mukaiyama aldol reaction, is the most representative example of their potential for the formation of $\mathrm{C}-\mathrm{C}$ bonds in a stereocontrolled manner. ${ }^{25}$

In 1989 Mukaiyama described the first catalytic enantioselective reaction of silyl enol ethers derived from esters ${ }^{26}$ and thioesters ${ }^{27}$ employing a tin(II)-chiral diamine complex as the catalyst. Following this seminal work, several chiral Lewis acids have been developed for the catalytic enantioselective Mukaiyama reaction. ${ }^{28}$ The most representatives are shown in Figure 7.

On the other hand, Denmark and coworkers ${ }^{41}$ reported a distinct strategy for the catalytic asymmetric directed aldol reaction based on the activation of trichlorosilyl enol ethers by a chiral phosphoramide Lewis base catalyst. Contrary to the Lewis acidcatalyzed processes, which tend to provide the syn-adducts, this methodology is stereospecific and can provide either syn- or anti-adducts selectively by judicious choice of the catalyst or the $E$ or $Z$ configuration of the starting silyl enolate for ketones (Scheme 2a) and aldehydes (Scheme 2b) respectively. ${ }^{42}$
b)

Scheme 2

Whereas some methods with the "Mukaiyama reaction scheme" are quite efficient and general, and proceed with high stereocontrol (both absolute and relative), preparation of the silyl enolate in a previous and irreversible synthetic operation employing stoichiometric quantities of reagents constitutes an important drawback. ${ }^{43}$ In

contrast, direct methods that allow the reaction of unmodified carbonyl compounds with the corresponding electrophiles are particularly attractive, especially if a substoichiometric amount of a chiral promoter is sufficient to attain good yield and selectivity. An overview of these approaches is described next.

### 1.2. Direct catalytic asymmetric $\alpha$-functionalization of carbonyl compounds

It is well known that enzymes are able to trigger the $\alpha$-functionalization of unmodified carbonyl compounds with extremely high efficiency and selectivity. Thus, enzymes meet perfectly the atom and step economy principles, doing their work with high efficiency and selectivity most often by activating both the donor and acceptor components of a given reaction concurrently. Following a similar principle of concomitant substrate activation, chemists have developed synthetic catalysts capable of promoting $\alpha$-functionalization of carbonyl compounds leading to the formation of a stereogenic center in the $\alpha$-position in a direct fashion with considerable success. Main developments in this field are briefly described next according to two categories: metalbased methods and organocatalyst-based methods.

### 1.2.1. Methods based on metal catalysts

A significant breakthrough in this area came from the laboratories of Shibasaki and Trost, who independently introduced new bifunctional Lewis acid/Brønsted base metal complexes capable of catalysing some fundamental $\mathrm{C}-\mathrm{C}$ bond forming reactions. ${ }^{44}$

In 1996, Shibasaki ${ }^{45}$ and coworkers used a bifunctional heterobimetallic catalyst to perform the Michael addition of cyclic $\beta$-ketoesters to methyl vinyl ketone and acrylates obtaining moderate to very good enantioselectivities (Scheme 3a). Later, the group developed similar catalysts for the Mannich reaction between aromatic ketones and aminoethyl ethers (in low enantioselectivity and high catalyst loading, Scheme 3b), ${ }^{46}$ and the aldol reaction of 2-hydroxyacetophenone with aliphatic unbranched

[^5]aldehydes (Scheme 3c), ${ }^{47}$ which had not been previously used in direct aldol reactions, presumably due to their tendency towards enolization. The main concept involved in these researches is that the metal complexes have a basic site and an acidic site which can work in concert for the activation of both the donor and the acceptor reaction components.
a)

60-98\% yield, 62-91\% ee
b)

c)

## Scheme 3.

[^6]On the other hand, Trost and coworkers reported the aldol reaction of 2hydroxyacetophenone with aliphatic aldehydes, including the more challenging unbranched aldehydes, catalyzed by a bifunctional dinuclear Zn catalyst which proceeds with high enantio- and diastereoselectivities (Scheme 4). ${ }^{48}$ This catalyst could be later applied to a related Mannich reaction. ${ }^{49}$

## Scheme 4.

Following these first examples, there have been several other reports dealing with the $\alpha$-functionalization of enolizable carbonyl compounds based on chiral metallic catalysts. ${ }^{50}$

Despite several kinds of $\alpha$-functionalization procedures using metallic catalysts have been described to give rise very good yield and stereocontrol, direct procedures are still limited to the use of activated carbonyl compounds, mainly those bearing an electron withdrawing group at the $\alpha$-position or in some instance having an aryl substituent. Furthermore, many of these methods rely on the use of rare (and toxic) metals of limited availability and are often highly sensitive to the presence of traces of water or oxygen in the reaction medium.

[^7]
### 1.2.2. Methods based on organocatalysts

With the renaissance of organocatalysis at the beginning of this millennium, new opportunities appeared for achieving the selective $\alpha$-functionalization of enolizable carbonyl compounds. ${ }^{51}$ Two main ways for the activation of the enolizable carbonyl substrate have been exploited: activation via enamine formation (aminocatalysis) and activation via enolization (Brønsted base catalysis).

### 1.2.2.1. Activation via enamine formation (covalent)

Small primary or secondary amines can condense with carbonyl compounds, more specifically aldehydes or ketones, leading to enamines which have increased nucleophilicity and are capable of reacting with a variety of electrophilic reagents. In the classical stoichiometric procedure (see Figure 3 above), the chiral enamine is isolated and then reacted with an electrophile. The adduct thus obtained can be hydrolysed aftermaths under acidic conditions affording the desired $\alpha$-substituted carbonyl compound and recovering the starting chiral amine. ${ }^{52}$

In enamine mediated catalysis, the same process happens within a catalytic cycle that contains as the main steps the following (Scheme 5): i) condensation of the chiral amine catalyst and the enolizable carbonyl compound, forming an iminium-ion; ii) deprotonation of the iminium leading to an enamine intermediate; iii) the stereochemistry-determining $\mathrm{C}-\mathrm{C}$ bond formation by reaction of the enamine with an electrophile; and iv) hydrolysis of the resulting iminium species to afford the desired $\alpha$ functionalized carbonyl product with regeneration of the chiral amine catalyst, which can then re-enter the catalytic cycle. ${ }^{53}$

[^8]

Scheme 5. Catalytic cycle for enamine mediated processes. All reactions are reversible, but one-way arrows are depicted for simplicity.

As established, the rate-determining step of this process is the formation of the enamine, which implies the abstraction of an $\alpha$-proton. ${ }^{54}$ Thus, protic additives and polar solvents play a critical role accelerating the deprotonation and stabilizing ionic charges respectively.

On the other hand, the principles that govern stereochemistry during the key $\mathrm{C}-$ C bond forming step and so determine the configuration of the newly formed $\alpha$ stereocenter obey to two general models as represented in Figure 8. According to the model on the left (H-bond as control element) the hydrogen-bond donor group of the catalyst directs the approach of the electrophile towards one of the sides of the prostereogenic $\mathrm{C}_{\alpha}$, while according to the model on the right (steric control) bulky substituents of the catalyst force the approach of the electrophile to be from the side opposite to the "obese" substituent of the enamine, with the enamine adopting the $E$ anti configuration preferentially.

[^9] 2011, 47, 632-649.
a) Hydrogen-bond mediated control

example:

b) Steric control

example:

Figure 8.

In these models, an important assumption concerns enamine configuration. From the four possible configurations (Figure 9), in the case of aldehydes ( $\mathrm{R}^{\prime}=\mathrm{H}$ ) the $E$-anti configuration is favoured. For ketones ( $\mathrm{R}^{\prime}=\mathrm{CH}_{2}-$ ), the $E$-syn configuration is assumed to be the most stable. ${ }^{55}$

Figure 9.

Following the discovery by List and Barbas in $2000^{56}$ of the potential of proline as a catalyst in the asymmetric intermolecular aldol reaction, the field of aminocatalysis has experienced an impressive growth, ${ }^{57}$ and enamine mediated catalysis has demonstrated to be an especially valuable tool for the introduction of $\alpha$-stereogenicity in aldehydes and ketones.

[^10]Notz and List reported the first example of the enamine-mediated asymmetric formation of an $\alpha$-stereogenic center in an aldol reaction using $\alpha$-hydroxyacetone as the donor compound. Given the easy enolization of aliphatic aldehydes the reaction is limited to aromatic or $\alpha$-branched aldehydes as acceptor components, affording the antialdol products in variable yields and diastereoselectivity, but in an overall excellent enantioselectivity (Scheme 6). ${ }^{58}$

## Scheme 6.

List ${ }^{59}$ and Maruoka ${ }^{60}$ extended the method to the addition of cyclic ketones to aldehydes and $\alpha$-ketoesters, respectively, with good results. List et al. were also the first to report the proline-catalyzed Michael ${ }^{61}$ reaction yielding products with a stereogenic center in $\mathrm{C}_{\alpha}$, albeit the enantioselectivity obtained was very low (Scheme 7).

Scheme 7.

Whereas these first examples demanded the use of a large excess of donor ketone compound, high catalyst loadings and prolonged reaction times, they demonstrated the true potential of aminocatalysis, and therefore a fast-paced era of proline-catalyzed reaction exploration began. In few years, a big amount of relevant proline-catalyzed procedures for the asymmetric reactions of ketones and aldehydes were disclosed. ${ }^{62}$

[^11]Meanwhile, in an attempt to overcome the limitations encountered when using proline, new and more efficient catalysts started to emerge, and the first approaches were mainly centered in the modification of the proline structure. The substitution of the carboxylic acid of proline for other functional groups resulted in catalysts with improved solubility in organic solvents and easier structural fine tune to better adapt to each particular substrate, thus improving the reactivity and the stereocontrol. Some of the most representative proline-based catalyst families used in the asymmetric $\alpha$ functionalization of aldehydes and ketones are shown in Figure $10 .{ }^{63}$ Of these catalysts, prolinol silyl ethers (Figure 10, F) have demonstrated the most versatile and general, catalysing a broad array of asymmetric reactions via either enamine or iminium activation. ${ }^{64}$

et al. used a primary amine catalyst derived from the natural amino acid L-alanine for the Michael addition of cyclic ketones to aromatic nitroalkenes (Scheme 8). ${ }^{66}$

Scheme 8.

De novo design secondary cyclic amines have also been demonstrated useful as aminocatalysts for activation via enamine formation. In particular, Maruoka et al. developed binaphtyl derived amine catalysts for the anti-Mannich and syn-aldol reactions, contributing to fill an important gap in asymmetric synthesis. ${ }^{67}$ The same group later extended the utility of these catalysts to the Michael addition using aldehydes as donors. ${ }^{68}$

Figure 11.

To sum up, impressive progress has been done during the last two decades in the development of enamine-based asymmetric $\alpha$-functionalization of carbonyl compounds. However, some recalcitrant problems regarding substrate scope, regio- and stereocontrol as well as some practical issues still remain. Indeed, the procedures

[^12]described so far are limited to aldehyde and ketone donors, and the use of sterically hindered ketones still remains challenging. Furthermore, unsymmetrical ketones have been scarcely used due to the difficulties in controlling the regiochemistry of the reaction and low diastereomeric ratios are obtained in many examples where two stereogenic centers are formed.

On the one hand, chemoselectivity is still an issue in cross aldol reactions involving aldehydes: these reactions may lead to two homoaldol and two cross-aldol products, and so use of large excesses of one of the components is usually required in order to obtain good yields and selectivity. On the other hand, sterically hindered carbonyl compounds have been scarcely used in enamine catalysis, due to their lower tendency towards formation of enamines.

### 1.2.2.2. Activation via base-promoted enolization (noncovalent)

The $\alpha$-deprotonation of enolizable carbonyl compounds by action of a base to yield the corresponding enolate is one of the most elemental mechanisms for carbonyl compound activation. ${ }^{69}$ Upon the subsequent reaction of the enolate with a suitable electrophile the base might get restored again, allowing to re-enter the activation pathway and render the process catalytic. Accordingly, a general catalytic cycle as that shown in Figure 12 could be invoked in which proton transfer events occur repeatedly.

Figure 12.

[^13]In such a process, the chirality transfer from the base (catalyst) to the product takes place during the key $\mathrm{C}_{\alpha}$ - E bond forming reaction and implies information transfer throughout a non-covalent substrate-catalyst ion-pairing complex. This constitutes a significant difference if compared with enamine catalysis described above, where a substrate-catalyst covalent complex is formed. The intrinsic nondirectional nature of electrostatic interactions in ion-pairing complexes makes predicting the sense of the stereoinduction exerted from the catalyst difficult. In this sense, molecules that combine a site acting as a base and another site with hydrogen-bond donor ability, namely bifunctional Brønsted base/H-bond donor catalysts, ${ }^{70}$ can anchor both nucleophilic and electrophilic components in the transition state. As a result, more active catalysts are obtained, and a higher degree of stereochemical order is achieved in the transition state (Figure 13).

Figure 13.

Different nitrogen-containing functionalities have been employed for the design of chiral BB catalysts. Among them, tertiary amines are the most prominent, but also guanidines, amidines, and imidazoles are used (Figure 14).

tertiary amines

guanidines

amidines

imidazoles

Figure 14.

The selection of the chiral basic unit is highly dependent on the availability of the corresponding optically pure precursors from the chiral pool. In this context, alkaloids and in particular cinchona family are a straightforward source of enantiopure BB catalyst candidates (Figure 15). Furthermore, simple chemical modifications of the

[^14]parent alkaloid structure provide a rapid access to stereochemically related architectures. Thus, these cinchona and cinchona-derived catalysts were the earliest bifunctional BB catalysts applied to the $\alpha$-functionalization of easily enolizable carbonyl compounds, usually bearing an EWG at the $\alpha$-carbon. ${ }^{71}$

$\begin{array}{ll}R=\text { OMe } & (-) \text {-Quinine } \\ R=H & (-) \text {-Cinchonidine } \\ R=O H & (-) \text {-Cupreidine }\end{array}$

$\begin{array}{ll}R=O M e & (+) \text {-Quinidine } \\ R=H & (+) \text {-Cinchonine } \\ R=O H & (+) \text {-Cupreine }\end{array}$

Figure 15.

Wynberg and coworkers, in the 70's were pioneers in this field and recognized the activation and stereoinduction capacity of cinchona alkaloid-derived catalysts, mainly for the Michael-type reactions. Although they obtained remarkable results for some transformations, such as the conjugate addition of thiols, ${ }^{72}$ poor enantioselectivities were reported for the conjugate addition of enolizable C nucleophiles (Scheme 9). ${ }^{73}$

Scheme 9.

[^15]Some years later, Szöllösi ${ }^{74}$ tested several cinchona alkaloid derivatives for the conjugate addition of different $\beta$-dicarbonyl compounds to methyl vinyl ketone, obtaining substantially better results (ee up to $83 \%$, Scheme 10).

## Scheme 10.

In a series of papers published from 2004 to 2006, Deng and coworkers ${ }^{75}$ studied the bifunctional BB-catalyzed conjugate addition of easily enolizable carbonyl compounds quite extensively employing a broad spectrum of Michael acceptors and bifunctional cupreine and derived catalysts (Scheme 11). Excellent yields and diatereoand enantioselectivities were obtained and they demonstrated the critical role of the 6'OH group of cupreine as a H -bond donor site, as both catalyst activity and enantioselectivity vary drastically when moving from cupreine to quinidine. ${ }^{75 a}$

Scheme 11.

[^16]The use of $\alpha$-chloroacrylonitrile as Michael acceptor by the same group ${ }^{76}$ is worth of mention. In this reaction two nonadjacent stereogenic centers are formed in a domino process with overall excellent results (Scheme 12). According to the authors, the cinchona catalyst first directs the addition of the nucleophile and then performs a stereoselective protonation of the resulting intermediate.

Scheme 12.

The $\alpha$-amination of carbonyl compounds represents another reaction category for which BB-catalysis has been successfully applied. Pikho and coworkers ${ }^{77}$ reported the first example with $\beta$-ketoesters using dibenzyl azodicarboxylate as the electrophile and cinchonine or cinchonidine as the catalyst, although enantioselectivity could not be higher than $88 \%$ ee. Almost at the same time, the group of Jørgensen ${ }^{78}$ achieved the highly enantioselective $\alpha$-amination reacting $\alpha$-aryl- $\alpha$-cyanoacetates with di-tert-butyl azodicarboxylate in the presence of a cinchona-alkaloid derivative. However, they obtained slightly lower selectivities when using $\beta$-diketones and $\beta$-ketoesters as pronucleophiles (Scheme 13a). Later Deng and coworkers ${ }^{79}$ also used these cupreinederived catalysts for the same reaction obtainig comparable results (Scheme 13b).

Scheme 13.

The quest for new and efficient bifunctional catalysts headed to the design and synthesis of enantiomerically pure amine derivatives bearing a range of H -bond donor sites. The most successful strategies to date merge a readily available chiral amine and an efficient H -bond donor group, such as a urea, thiourea, squaramide or sulphonamide (Figure 16). These modifications have led to increasingly active and selective bifunctional BB catalysts.

Urea

Thiourea

Squaramide

Sulfonamide

Figure 16.

In 2003, Takemoto et al. ${ }^{80}$ presented the first highly enantioselective catalyst based on these principles, a thiourea derived from 1,2-diaminocyclohexane, for the Michael addition of malonates to nitroalkenes. The same group later used the catalyst for the Michael and Mannich reactions of cyclic $\beta$-ketoesters generating adducts which

[^18]bear a tertiary or quaternary stereocenter at $\mathrm{C}_{\alpha}$ (Scheme 14). ${ }^{81}$ According to the authors, the catalyst activates the nucleophile through the amino group while the thiourea moiety activates the electrophile, forcing both components to approach in a stereospecific manner. ${ }^{82}$

## Scheme 14.

Other thiourea catalysts derived from diamines with $\mathrm{C}_{2}$-symmetry were also developed for the asymmetric $\alpha$-functionalization of carbonyl compounds, ${ }^{83}$ but because of the availability and versatility of cinchona-alkaloids, the thiourea-cinchona alkaloid catalysts soon became the most popular bifunctional catalysts in the area. ${ }^{84}$ For instance, between 2005 and 2006 Connon, ${ }^{85}$ Deng, ${ }^{86}$ Dixon, ${ }^{87}$ Soós ${ }^{88}$ and Wang ${ }^{89}$ independently

In 2008, Song and coworkers ${ }^{90}$ introduced a bifunctional cinchona alkaloidsulphonamide catalyst, for the desymmetrization of cyclic anhydrides. However, catalysts bearing a sulphonamide group have been scarcely used in the asymmetric $\alpha$ functionzalization of enolizable compounds, and so far they have been limited to the Michael reaction with nitroolefins. ${ }^{91} \mathrm{Lu}$ et al. ${ }^{91 a}$ reported the asymmetric $\alpha$ functionzalization of cyclic $\beta$-ketoesters derived from 1 -indanone using this kind of catalyst (Scheme 15). Adducts were obtained in excellent yield and enantioselectivity and good diastereoselectivity, although $e e$ 's were eroded when varying the rig-size or removing the fused aromatic ring.

Scheme 15.

The same year, Rawal and coworkers ${ }^{92}$ introduced the squaramide function as efficient double H -bond donor site in asymmetric catalysis. Both (thio)urea and squaramides are structurally rigid, although there are some differences. On the one hand, squaramides contain two hydrogen-bond donors ( $N-H$ ) and two carbonyl acceptors $(C=O)$, showing one more acceptor than thioureas. On the other hand, the cyclobutenedione ring induces a convergent orientation of the $N-H$ groups, and the distance between them is estimated to be bigger $(2.71 \AA)^{92}$ than in the case of thioureas ( $2.13 \AA$ ) (Figure 17 a ). ${ }^{93}$ Both functionalities have the possibility of delocalizing the nitrogen lone pair through the carbon-heteroatom double bond, but in the case of squaramides further delocalization can occur through the cyclobutenedione system

[^19](Figure 17b), ${ }^{94}$ thus making the $N-H$ acidity of the squaramide catalysts higher compared to the thiourea analogs. ${ }^{95}$ Accordingly, squaramides can form stronger hydrogen bonds, which may account for their comparatively higher activity, even at relatively low catalyst loadings.

Figure 17.

Cinchonine derivatives bearing a squaramide group proved to be good promoters for the Michael addition of $\beta$-ketoesters and $\beta$-diketones to $\beta$-arylnitroalkenes (Scheme 16). ${ }^{92}$ The corresponding adducts were obtained in excellent yield and enantioselectivity, but the most remarkable aspect of this reaction is the low catalyst loading (as low as $0.1 \mathrm{~mol} \%$ ) needed for effective stereocontrol.

## Scheme 16.

[^20]Encouraged by this unusual activity, in the following years many new squaramide catalysts were employed in different reactions, ${ }^{96}$ with special success in domino and tandem processes. ${ }^{97}$

On the other hand, Wang et al. developed a different kind of bifunctional organocatalyst based on bifunctional amine-thioureas bearing three hydrogen-bond donor sites. The undelaying idea is that one more interaction site would lead to the formation of additional hydrogen bonds, thus improving the efficiency of the catalyst. ${ }^{98}$ This group demonstrated the utility of these catalysts for the Michael reaction of $\beta$ ketoesters and $\beta$-diketones with nitroalkenes, obtaining the corresponding adducts in excellent yield, diastereo- and enantioselectivity (Scheme 17). ${ }^{99}$

## Scheme 17.

Shortly before beginning this Thesis work, our research group introduced a new type of bifunctional BB catalyst based on the presence of a ureidopeptide unit as the H bond donor site. ${ }^{100}$ These catalysts were demonstrated to be very efficient in the Michael addition to nitroolefins and the amination of 5 H -thiazol-4-ones (Scheme 18). These catalysts, which offer three independently modifiable parts, outperformed cinchona alkaloids and the Takemoto catalyst. It is worth noting that this was the first time 5 H -thiazol-4-ones were used in asymmetric synthesis.

[^21]

Scheme 18.

On the other hand, guanidines represent another class of BB-catalysts. Guanidines can be categorized as organic superbases, owing to the stability of their conjugated acids (Figure 18), and therefore they are capable of catalysing various basemediated organic reactions. ${ }^{101}$ Another feature of guanidines is that the bidentate group may activate both the nucleophile and the electrophile concomitantly (Figure 18). ${ }^{102}$

BB activation of both the nucleophile and the electrophile

Figure 18.

[^22]In 2001, Ishikawa and coworkers ${ }^{103}$ reported the first highly effective BB catalyzed Michael reaction using a 1,2-diphenylethylenediamine-derived chiral guanidine. The Michel reaction under neat conditions between glycine imine and several different acceptors afforded up to $97 \% e e$, but a big excess of the acceptor was required in order to obtain a good yield (Scheme 19).

Scheme 19.

The bicyclic $\mathrm{C}_{2}$-symmetric chiral guanidine introduced by the group of Corey ${ }^{104}$ in 1999 is one of the most popular guanidine catalysts. In 2007, Tan and Jiang ${ }^{105}$ reported the Michael reaction between different Michael acceptors and active methylene compounds to afford excellent yield and ee values, but zero diastereoselectivity, presumably due to subsequent epimerization of the $\alpha$-carbon (Scheme 20).

## Scheme 20.

To conclude, although BB catalysis has been successfully employed in the $\alpha$ functionalization of an array of enolizable carbonyl compounds, most of the methods are restricted to easily enolizable nucleophiles typically bearing an EWG at the $\alpha$ position like malonates, cyanoacetates, $\beta$-ketoesters, etc. In addition, most asymmetric

[^23]procedures reported to date lead to the formation of a single stereogenic center or provide two consecutive new stereogenic centers with variable diastereoselectivity. On the other hand, among the Michael acceptors used so far, $\alpha, \beta$-unsaturated carboxylic acid equivalents (enoates) remain little explored.

### 1.3. Limitations and general objectives

As can be seen in the previous sections, procedures for the direct asymmetric $\alpha$ functionalization of carbonyl compounds still have some important limitations regarding the scope of nucleophiles and electrophiles suitable for attaining high reactivity and selectivity.

On the one hand, the enamine mediated cross-aldol reactions between two enolizable compounds remain troublesome due to the potential formation of up to four distinct aldol products, especially when using aldehydes as nucleophiles (Figure 19a). On the other hand, the use of $\alpha, \beta$-unsaturated carbonyl compounds as electrophiles in asymmetric $\mathrm{C}-\mathrm{C}$ bond forming catalysis has been little explored, in part owing to competitive 1,2- versus 1,4-addition pathways (Figure 19b).

b)

Figure 19.

These and other yet problematic issues, such as the creation of quaternary stereocenters or two adjacent stereocenters in an enatio- and diastereoslective manner, have been addressed in the present investigation. More specifically, we hypothesized that the use of propargylic carbonyl compounds as acceptors might provide a solution to the problematic cross-aldol reaction with enolizable aldehydes. As will be outlined later, these aldehydes have not been previously employed as acceptors in direct aldol reactions. The total or partial reduction of the triple $\mathrm{C} \equiv \mathrm{C}$ bond in adducts should afford products that are formally derived from a troublesome cross-aldol reaction. Two
additional characteristics of this realization would be: i) the simultaneous formation of two contiguous stereogenic centers; and ii) the production of densely functionalized building-blocks, appropriate for ulterior application in the synthesis of structurally complex molecules.

Figure 20.

At the outset, this plan faced several challenges:

- Selective activation of the propargyl aldehyde as electrophile
- Suppression of the homodimerization of the enolizable aldehyde
- Control of the 1,2 - vs 1,4- addition to ynones
- Control of the diastereo- and enantioselectivity

In a second part, we focused on some problems inherent to BB-catalyzed $\alpha$ functionalization of carbonyl compounds. In particular, one limitation of the existing methods, as mentioned before, is the need for an additional EWG being attached to the $\alpha$-carbon, which makes the $\alpha$-carbon more acidic ( $13-18 \mathrm{p} K_{\mathrm{a}}$ range) ${ }^{106}$ and therefore suitable for enolization by common organic bases (Table 2). In contrast, unactivated carbonyl compounds display higher $\mathrm{p} K_{\mathrm{a}}$ values and thus are more challenging substrates for activation by Brønsted base catalysis.

[^24]Table 2. $\mathrm{p} K_{\mathrm{a}}$ values in DMSO for representative carbonyl compounds and organic BB. ${ }^{106}$

| Carbonyls | $\mathrm{p} K_{\mathrm{a}}$ |  | Bases | $\mathrm{p} K_{\mathrm{a}}$ of conjugated acid |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{R}=\mathrm{H}$ | $\mathrm{R}=\mathrm{Ph}$ |  |  |
|  | 26.5 | 19.8 | $\left[\begin{array}{l} \hat{N}_{\mathrm{N}} \\ \hline \end{array}\right.$ | 8.9 |
|  | 24.7 | 17.7 | TEA | 9.0 |
|  | 35 | 25.9 | $\alpha_{N}$ | 9.8 |
|  | 30.3 | 23.6 |  | 12.0 |
|  | - | 16.9 |  | 13.6 |

On the other hand, the regioselective $\alpha$-functionalization of ketones with two enolizable positions ( $\alpha$ vs $\alpha^{\prime}$ ), and the stereoselective conjugate additions to enoates or equivalents also remain problematic.

Regiocontrol

## Reactivity

Figure 21.

In this context, our proposal was the use of $\alpha^{\prime}$-hydroxy enones in asymmetric organocatalysis for the first time. We hypothesized that chiral bifunctional BB catalysts might be able to trigger the Michael addition of pronucleophiles like 5 H -oxazol-4-ones and cyanoacetates to these electrophiles, allowing the generation of chiral tertiary alcohols and all-carbon tetrasubstituted stereogenic centers, respectively.

Scheme 21.

A third problem we addressed during this Thesis concerns the regioselective $\alpha$ functionalization of enolizable ketones. Following the work by Seebach ${ }^{107}$ and d'Angelo ${ }^{108}$ using enamine chemistry, we decided to take $\beta$-tetralones as a case study for achieving their regio- and stereoselective functionalization with the help of chiral bifunctional BB catalysts. The idea was that the fused aromatic ring in the molecule would induce preferential enolization at $\mathrm{C}_{\alpha}$, thus directing the functionalization towards that position.

Seebach (stoichiometric auxiliary)

d'Angelo (stoichiometric auxiliary)

Our proposal (catalytic)

Scheme 22.

In this particular development, several problems were apparent at the outset: i) control of the $\alpha / \alpha^{\prime}$ selectivity, ii) suppression of the double addition (over addition products), and iii) control of diastereo- and enantioselectivity.

As another relevant situation where regioselectivity is an issue, we also decided to investigate the BB-catalyzed functionalization of alkenyl ketones. Here a vinylogous enolate would be formed and so there is a double selectivity problem: $\alpha$ vs $\alpha$ ' vs $\gamma$. With these types of substrates, enamine-mediated catalysis usually provides the $\gamma$-addition adducts preferentially. We reasoned that bifunctional Brønsted base/ H -bond catalysis might direct the approach of the electrophile through the $\alpha$-position.

[^25]
## Competitive $\alpha$ vs $\gamma$ addition

Bifunctional BB* catalyst directed $\alpha$-addition

## Scheme 23.

In the last part of my Doctoral research period, a short stay was carried out under the supervision of Prof. Jonathan Clayden in the School of Chemistry of the University of Bristol in the United Kingdom. The research project there was focused on the preparation of arogenate derivatives starting from the natural amino acid tyrosine. Arogenate derivatives are potential candidates for application as selective herbicides, and the development of an efficient and reproducible synthetic route to arogenate involving stable and modifiable intermediates is of current interest.

## Enamine-mediated aldol reaction of aldehydes with propargylic aldehydes and ketones

### 2.1.Precedents and objectives

Propargylic carbonyl compounds are attractive acceptors in $\mathrm{C}-\mathrm{C}$ bond forming reactions, not only because the acetylenic system in the resulting adduct is an interesting scaffold for synthetic purposes, but also because they might be viewed as surrogates of simple enolizable aldehydes and $\alpha, \beta$-enals given the ease with which the alkyne moiety may be easily transformed (upon total or partial reduction of the triple bond) into the corresponding alkyl and alkenyl units, respectively.

Despite the aldol reaction is one of the most extensively studied $\mathrm{C}-\mathrm{C}$ bond forming transformations, at the beginning of this project there were only three examples of asymmetric catalytic direct aldol reactions involving propargylic aldehydes. The first two examples, reported by the groups of Mahrwald ${ }^{109}$ and Shair, ${ }^{110}$ were based on the use of metal complexes. Mahrwald used a titanium-BINOL complex for the asymmetric addition of a symmetric linear ketone to propargylic aldehyde 1a (Scheme 1a), obtaining the corresponding aldol adduct in good yield, low syn/anti selectivity and good enantioselectivity. On the other hand, Shair et al. developed a Cu-catalyzed decarboxylative aldol addition of a malonic acid half thioester to propargylic aldehyde 1b (Scheme 1b), which yielded the aldol reaction product in moderate yield, low diastereoselectivity and excellent enantioselectivity.

[^26]
b) Shair

59\% yield syn:anti = 2.2:1 96\% ee (syn)
c) Li

## Scheme 1.

Li et al. ${ }^{111}$ reported in 2003 the third and only organocatalytic example described before the beginning of this project (Scheme 1c). The L-proline catalyzed reaction of TBDMS-protected hydroxyacetone with a propargylic aldehyde afforded a mixture of aldol adducts with low selectivity.

While our investigation was in progress, Ricci, Quignard et al. ${ }^{112}$ published the aldol reaction of cyclohexanone with different aldehydes, including propargylic

[^27]aldehydes, catalyzed by a chitosan aerogel. When phenylpropargyl aldehyde 1a was employed, very low diastereoselectivity and moderate $e e$ were obtained (Scheme 2).

Scheme 2.

The control of chemoselectivity is especially troublesome in aldol reactions involving linear aldehydes as donor components, given the likelihood to have competitive undesired self-aldol processes. To our knowledge, the sole previous example of catalytic asymmetric aldol reaction using enolizable aldehydes as donor components was reported by Denmark and Ghosh ${ }^{113}$ and involves trichlorosilyl enol ethers derived from aldehydes as nucleophiles and a phosphoramide catalyst (Scheme 3). Although cross-aldol products were obtained in excellent yield and diastereoselectivity, the enantioselectivity turned out to be of $76 \%$ ee at best.

$>98 \%$ yield, $d r=>20: 1$
7\% ee (syn), 76\% ee (anti)

Scheme 3.

As to the use of propargylic ketones as electrophiles in asymmetric catalytic aldol reaction, the only example to date has been reported by Maruoka et al., ${ }^{114}$ who during the progress of this project documented the aldol reaction of symmetric ketones

[^28]with a single propargylic $\alpha$-ketoester 2a employing a chiral primary amine catalyst. The corresponding adducts were obtained selectively with the $\mathrm{C}_{\alpha}$-alkyl and the $\mathrm{C}_{\beta}-\mathrm{OH}$ groups in the syn- relative position in excellent yield and enantioselectivity. An interesting aspect of this development is that the enantioselectivity could be inverted by addition of an achiral Brønsted acid (Scheme 4).

Scheme 4.

In this same context, I. Otazo and I. Lapuerta during their Thesis work and S. Vera, in our group reported a general procedure for the asymmetric direct Mannich reaction between aldehydes and unactivated imines, ${ }^{115}$ including propargylimines (Scheme 5), promoted by certain silylprolinol ether catalysts. ${ }^{116}$ These catalysts, exemplified by $\mathbf{C 1}$, bear two geminal $\alpha, \alpha$-alkyl groups instead of the gem- $\alpha, \alpha$-diaryl groups present in the commonly employed $\alpha, \alpha$-diaryl prolinol ethers (Jørgensen and Hayashi catalysts). During this development, it was observed that while these catalysts conducted the Mannich reaction with high efficiency and selectivity in the presence of a Brønsted acid cocatalyst (i.e. pNBA), no appreciable amounts of self-aldol product was formed at the low reaction temperatures utilized $\left(\sim-60^{\circ} \mathrm{C}\right)$. This result was explained assuming that the imine component would be selectively activated by the added Brønsted acid (protonated imine) even at low temperature, thus skipping the problem of aldehyde self-condensation.

## Scheme 5.

Following this previous work and taking into consideration the few precedents described on the direct asymmetric catalytic aldol reaction involving propargylic carbonyl compounds, and especially the lack of methods employing aldehydes as donor carbonyl compounds in the direct catalyzed version of the reaction, we set out to study the aldol reaction between enolizable aldehydes and propargylic carbonyl compounds with the aim of developing an efficient organocatalytic system. However, only moderate yield and diastereoselectivity were obtained following the procedure described for propargylic imines (Scheme 6).

## Scheme 6.

With the aim to improve this result, it was reasoned that an efficient and selective activation of propargylic aldehydes as acceptors might be achieved by a simple metal cocatalyst capable of coordinating to ynals. Thus, it was found that when adding
$10 \mathrm{~mol} \%$ of the CuI metal salt to the reaction both the yield and the diastereoselectivity of the reaction were significantly improved (Scheme 7). ${ }^{117}$

## Scheme 7.

Some of the most representative examples of the reaction scope, part of the doctoral Thesis of I. Lapuerta, are shown in Table 1. As it can be seen, the reaction proceeded smoothly and in good yield and the corresponding adducts were isolated either as diols or acetals to avoid epimerization of $\mathrm{C}_{\alpha}$. The reaction tolerated well both aromatic ( $\mathbf{4 A a}$ and $\mathbf{4 A c}$ ) and aliphatic ( $\mathbf{4 A d}$ and $\mathbf{5 A b}$ ) propynals and donor ramified aldehydes (5Ca) or aldehydes with additional functional groups (4Ad and 5Ba). Furthermore, the syn/anti ratios were higher than 1:5 in all cases, and ee values for the major isomer (anti) were above $90 \%$ ee.

[^30]Table 1. Cross-aldol reaction scope between saturated and propargylic aldehydes ${ }^{[a]}$

[a] Reactions conducted on a 0.5 mmol scale in 0.5 mL of $\mathrm{THF}\left(\mathbf{3} / \mathbf{1} / \mathbf{C 1} / \mathrm{PhCO}_{2} \mathrm{H} / \mathrm{CuI}\right.$ molar ratio $=$ 1.5:1:0.2:0.2:0.1). Combined yield of syn/anti adducts after chromatography. syn:anti values determided by ${ }^{1} \mathrm{H}$ NMR spectroscopy and corroborated by HPLC. ee of major (anti) isomer, determined by chiral HPLC.

It should be noted that shortly after these preliminary results were disclosed, Hayashi and coworkers ${ }^{118}$ reported the direct aldol reaction between aldehydes and propargylic aldehydes employing a prolinol catalyst and water as the only additive (Scheme 8). This method, which applies a subsequent Wittig reaction, requires a large excess ( 5 equiv.) of the donor aldehyde and provides modest syn/anti selectivity (1:21:6 while our method afforded typically $1:>9$ syn/anti ratios).

## Scheme 8.

[^31]When the donor aldehyde bears a $\omega$-olefin function (i.e. $\mathbf{3 b}$ ), the resulting adduct (i.e. 5Ba) is an $1, \omega$-enyne and therefore could participate in a Pauson-Khand intramolecular reaction. This type of oxygenated 1, $\omega$-enyne systems have been previously reported in the literature to provide upon Pauson-Khand reaction bicyclic [m.3.0] rings, ${ }^{119}$ which are found as subunits of natural sesquiterpene products. ${ }^{120} \mathrm{We}$ indeed observed that the treatment of the silylated derivative of 5Ba under PausonKhand reaction conditions afforded the corresponding bicyclic [3.3.0] compound in moderate yield and as a single isomer (Scheme 9).

## Scheme 9.

Based on these precedents, we set out to study the reaction generality for a range of $\omega$-unsaturated aldehydes as donors in order to apply the aldol reaction to the preparation of hydroxyl Pauson-Khand precursors, commencing by examining the best reaction conditions for these particular substrates.

## Scheme 10.

We planned to study also the suitability of the approach for acetylenic ketones (ynones) as acceptors. If successful, this development would considerably expand the pool of accessible compounds including those with a tertiary carbinol, which are considerably more challenging to obtain in a stereoselective manner.

[^32]

Scheme 11.

### 2.2.Enamine-mediated aldol reaction of $\omega$-unsaturated aldehydes with propargylic aldehydes

### 2.2.1. Initial experiments and reaction optimization

Initially a study of the best reaction conditions for these types of unsaturated donor aldehydes was carried out with the reaction between 4-pentenal (3B) and phenylpropinal (1a) taken as a model. The data of the most representative experiments are shown in Table 2. First reactions were carried out under the general conditions previously established in the group for the direct asymmetric reaction of enolizable aldehydes with ynals ${ }^{117}$ ( 1.5 equiv. of donor aldehyde, $20 \mathrm{~mol} \% \mathbf{C 1}, 20 \mathrm{~mol} \%$ benzoic acid and $10 \mathrm{~mol} \% \mathrm{CuI}$ at $-60^{\circ} \mathrm{C}$ ) (Table 2, entry 1) and after 48 h and subsequent acetalization, the desired adduct 5Ba was obtained in good yield and very high diastereo- and enantioselectivity. When running the reaction without any benzoic acid cocatalyst, low conversions ( $<30 \%$ ) were obtained (Table 2, entry 2), corroborating the crucial role played by this cocatalyst. However, when running the reaction in the absence of CuI (Table 2, entry 3), only a little erosion in diastereoselectivity was observed. On the other hand, lowering the loading of the amine catalyst and the benzoic acid to $10 \mathrm{~mol} \%$ resulted in low conversion after 48 h (Table 2, entry 4).

Next, we studied the performance of the purposely synthesised related amine catalysts $\mathbf{C 2}-\mathbf{4}$, which bear different $O$-protecting groups. When using catalyst $\mathbf{C 2}(\mathrm{R}=$ $\mathrm{SiPh}_{2} \mathrm{Me}$; Table 2, entry 5), the yield and enantioselectivity were similar to those values obtained with C1, but the syn/anti ratio turned out to be only moderate (syn/anti $=1: 4$ ). Moreover, using CuI in combination with $\mathbf{C 2}$ the same results were obtained (Table 2, entry 6). Amine C3 also rendered adduct 5Ba in similar results (Table 2, entry 7) without any metal salt, but when the reaction was run in the presence of CuI (Table 2, entry 8) very low conversion of the reaction was observed. The reactivity and selectivity observed when using catalyst $\mathbf{C 4}$ (Table 2, entry 9) in the absence of the metal was once again similar to $\mathbf{C 2}$ and $\mathbf{C 3}$, but when carrying out the reaction in the presence of CuI
(Table 2, entry 10) eroded yields were obtained. These results indicate a correlation between the silyl group of the catalyst and the reaction selectivity, given that changing the triphenylsily group of $\mathbf{C 1}$ for a less sterically demanding silyl group severely eroded the syn/anti ratio. Furthermore, whilst the effect of added CuI in the reaction seems to vary with the nature of the silyl substituent of the aminocatalyst, in neither case it plays a beneficial role in terms of reactivity or selectivity.

| [a] Reactions conducted on a 0.5 mmol scale in 0.5 mL of THF ( $\mathbf{3 B} / \mathbf{1 a} / \mathrm{cat} / \mathrm{PhCO}_{2} \mathrm{H} / \mathrm{CuI}$ molar ratio $=$ 1.5:1:0.2:0.2:0.1). [b] Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy on reaction aliquots before workup. [c] Combined yield of syn/anti adducts after chromatography. [d] Determided by ${ }^{1} \mathrm{H}$ NMR spectroscopy and corroborated by HPLC. [e] ee of major (anti) isomer, determined by chiral HPLC. [f] Reaction conducted without $\mathrm{PhCO}_{2} \mathrm{H}$. [g] Reaction conducted with $10 \mathrm{~mol} \%$ of the amine catalyst and $\mathrm{PhCO}_{2} \mathrm{H}$. |  |  |  |  |  |  |

We also tested the $\alpha, \alpha$-diaryl catalysts $\mathbf{C 5}$ and $\mathbf{C 6}$ (Table 2, entries 11 and 13) which indeed did promote the cross-aldol reaction with similar efficiency but with
lower syn/anti selectivity as compared with $\mathbf{C 1}$. Again, when performing the reaction in the presence of $10 \mathrm{~mol} \% \mathrm{CuI}$ (Table 2, entries 12 and 14), a lower reactivity of the catalytic system was observed. Moreover, for $\mathbf{C 5}$ the use of the metal salt also led to a loss of diastereoselectivity (Table 2, entry 12).

From these results it could be deduced that the amine / Brønsted acid combination was crucial for the reaction, being amine catalyst $\mathbf{C 1}$ the optimum, and that the use of a metal cocatalyst would not lead to any improvement in the case of aldehyde 3B.

Both the reaction conversion and syn/anti ratios were determined by ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz})$ analysis of untreated and treated samples of the reaction (Figure 1 and 2, respectively). Thus conversions were measured by comparison of the peak areas of the protons linked to the carbonyl group of both the propargylic aldehyde $\mathbf{1 a}$ ( $9.43 \mathrm{ppm}, 1$ H) and adduct 5Ba (both syn and anti; $9.89 \mathrm{ppm}, 1 \mathrm{H}$ ) respectively. The signal at 9.78 ppm corresponds to the donor aldehyde $\mathbf{3 B}$.

Figure 1.

On the other hand, the syn/anti ratio was determined by comparing the peak areas of the protons present in the methoxy groups of the acetal. The signals at 3.470 ppm ( 3 H ) and $3.458 \mathrm{ppm}(3 \mathrm{H})$ correspond to the anti adduct (major), and the signal at $3.453 \mathrm{ppm}(6 \mathrm{H})$ corresponds to syn adduct (minor).

Figure 2.

### 2.2.2. Reaction scope

Once the optimization of the model reaction was performed, the reaction of aldehyde 3B with a selection of four propargylic aldehydes was carried out following the next standard procedure: the acceptor ynal was dissolved in THF (1 M) at $-60{ }^{\circ} \mathrm{C}$ and 1.5 equivalents of the donor aldehyde and $20 \mathrm{~mol} \%$ of each the catalyst $\mathbf{C 1}$ and benzoic acid were added. The reaction mixture was stirred at the same temperature, and after verifying by ${ }^{1} \mathrm{H}$ NMR analysis of untreated aliquots that the reaction stopped (2448 h ), the mixture was treated with $\mathrm{HC}\left(\mathrm{OCH}_{3}\right)_{3}$ (3 equivalents) in the presence of 20 mol $\%$ TSA at $0{ }^{\circ} \mathrm{C}$ for 2 h . The corresponding dimethyl acetal products were isolated by flash column chromatography on silica gel eluting with hexane/EtOAc mixtures.

The results in Table 3 show that the reactions proceeded in good yield with either aromatic (5Ba), aliphatic (5Bb), or heteroaromatic (5Bd) propynals. In addition, the reaction was performed in a 5 mmol scale to afford adduct $5 \mathbf{c}$ in excellent diastereoand enantioselectivity, although the yield was only moderate due to a lower conversion of the reaction. Furthermore, the syn/anti ratio varies from minimum of 1:8 to 1:20, and the lowest enantioselectivity for the major isomer (anti) was $96 \%$ ee.

### 2.2.3. Elaboration of the adducts: Pauson-Khand reaction

The Pauson-Khand reaction, introduced in 1971, ${ }^{121}$ is a formal $[2 \pi+2 \pi+2 \pi]$ cycloaddition between an alkyne, an alkene, and carbon monoxide to afford a $\beta$ cyclopentanone, catalyzed by cobalt (usually dicobalt octacarbonyl).

For the reaction to be efficient, high stereo- and regioselectivity must be obtained. In the case of an intramolecular reaction, two isomeric bicyclic products (exo and endo) can be formed, as depicted in Figure 3.

[^33]

Figure 3. General scheme of the intramolecular Pauson-Khand reaction

At the outset it had been reported that unprotected propargylic alcohols are not suitable substrates for the Pauson-Khand reaction, ${ }^{122}$ and that protection of the alcohol as a silyl ether allows the Pauson-Khand reaction to proceed.

Considering this, a preliminary study to establish the ideal protecting group and reaction conditions for the formal $[2+2+2]$ cycloaddition process was performed. ${ }^{123}$ Trimethylamine $N$-oxide (TMANO) was added to oxidize the CO liberated in the coordination of the cobalt to the alkyne, forming $\mathrm{CO}_{2}$ and rendering the step irreversible, thus allowing the use of milder reaction conditions. ${ }^{124}$ As the data summarized in Table 4 show, the bulkiest silyl groups $\left(\mathrm{Si}^{i} \mathrm{Pr}_{3}, \mathrm{Si}^{\left.\left(\mathrm{SiMe}_{3}\right)_{3}\right) \text { turned out to }}\right.$ be the most efficient, giving rise to the desired cycloadducts essentially as a sole diastereomer (Table 4, entries 4 and 5). The reaction also proceeded with yields around $65-70 \%$ when using the less bulky groups $\left(\mathrm{SiMe}_{3}, \mathrm{SiPh}_{3}, \mathrm{SiMe}_{2}{ }^{\mathrm{t}} \mathrm{Bu}\right)$ but led to diastereomeric mixtures (Table 4, entries 1, 2 and 3). In every case the corresponding cycloadducts were obtained in a completely exo-selective manner.

[^34]Table 4. Effect of the protecting group in the Pauson-Khand reaction stereoselectivity ${ }^{[a]}$

[a] Reactions conducted on a 0.5 mmol scale in 0.5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. [b] Combined yield of exolendo adducts after chromatography. [c] Determided by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

Next, the conditions optimized for enyne 5Ba were applied to the adducts 5Bc and 5Bd. As shown in Table 5, the desired bicyclic adducts were obtained satisfactorily with aliphatic (7c) and heteroaromatic (7d) R groups in good yield and essentially as a single diastereomer.

Table 5. Pauson-Khand reaction scope ${ }^{[a]}$

[a] Reactions conducted on a 0.5 mmol scale in 0.5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. dr determided by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

The configuration of the major and minor diastereomers was deduced by ${ }^{1} \mathrm{H}$ NMR chemical shift correlation (Figure 3). It was previously established that for this kind of bicycles with the $\mathrm{H}^{\mathrm{a}}$ and $\mathrm{H}^{\mathrm{c}}$ in a trans relationship, $\mathrm{H}^{\mathrm{a}}$ resonates more up-field
than in the corresponding cis isomer. ${ }^{125}$ Accordingly, using the trimethylsilyl protected adducts (5:1 dr), the major isomer was assigned as trans $\mathrm{H}^{\mathrm{a}}-\mathrm{H}^{\mathrm{c}}\left(\mathrm{H}^{\mathrm{a}}\right.$ signal at 4.8 ppm$)$ and the minor as cis $\left(\mathrm{H}^{\mathrm{a}}\right.$ signal at 5.2 ppm$)$. Finally, it was observed that $\mathrm{H}^{\mathrm{b}}$ also follows the same trend ( 5.1 ppm for the major isomer and 5.6 for the minor).

trans $\mathrm{H}^{\mathrm{a}}-\mathrm{H}^{\mathrm{c}}$

cis $\mathrm{H}^{\mathrm{a}}-\mathrm{H}^{\mathrm{c}}$

Figure 4.

Finally, the unprotected aldehyde $\mathbf{8}$ was obtained from the cycloadduct 7a upon exposure to Mori's conditions $\left(\mathrm{FeCl}_{3} / \mathrm{SiO}_{2}\right)^{126}$ in methylene chloride (Scheme 12). Although hydrolysis was not complete, the unreacted dimethyl acetals could be easily recovered by column chromatography and recycled, obtaining good yields after two reaction cycles. Other attempted methods for the hydrolysis were the use of Amberlyst15 in acetone, which led to no reaction, and the use of HCl in acetone / water, which led to very low yields due to undesired side-reactions.

## Scheme 12.

[^35]
### 2.2.4. Reaction stereochemistry

The stereochemical results obtained in the aldol reaction can be explained through the two competing open models $\mathbf{A}$ and $\mathbf{B}$ presented in Scheme 13. In B overlapping of the bulky substituents of amine $\mathbf{C 1}$ and the propargylic group of the ynone 1 would lead to an unfavourable approaching, thus leading towards the preferential formation of the anti-adduct.

A (favoured)

B (unfavoured)

Scheme 13.

The observed reaction stereochemistry in the Pauson-Khand reaction can be explained through the chair-like models $\mathbf{C}$ and $\mathbf{D}$ presented in Figure 5. A destabilizing pseudo-1,3-diaxial interaction between the hydrogen at $\mathrm{C}_{\alpha}$ and the coordinated metal in model $\mathbf{D}$ could determine the positioning of the metal complex, and thus the final configuration of the adduct (7).

Figure 5.

### 2.3.Enamine-mediated cross aldol reaction of aldehydes with propargylic $\alpha$-ketoesters

### 2.3.1. Initial experiments and reaction optimization

The purpose was to explore the possibility of extending the above method to ynones as acceptors. Initially, the reaction between hydrocinnamaldehyde (3A) and ynone 2a was studied using the conditions developed in the previous section (Table 6, entry 1), and low conversions were obtained after 20 h . This result might be ascribed to either the lower solubility or the lower inherent reactivity of these ynones as compared with the parent ynals. Then the reaction temperature was raised to $-40^{\circ} \mathrm{C}$, which allowed the reaction conversion to be essentially complete after 48 h (Table 6 , entry 2), affording, after subsequent acetalization, the desired adduct 9Aa in good yield and high diastereo- and enantioselectivity. Further increase in temperature led to a lower ee (Table 6, entry 6). Furthermore, no significant improvement of reactivity or stereoselectivity was observed when using CuI or $\mathrm{Cu}(\mathrm{OAc})$ as additive (Table 6, entries

4 and 5 vs. 2). On the other hand, lowering the loading of the amine catalys and the benzoic acid to $10 \mathrm{~mol} \%$ yielded low conversions after 48 h (Table 6 , entry 3 ).

Next, the performance of the parent $\alpha, \alpha$-diaryl catalysts $\mathbf{C 5}$ and $\mathbf{C 6}$ was studied. Once again, both were equally efficient in terms of reactivity and enantioselectivity, but led to a diminished $d r$ (from 5:1 in entry 2 to nearly equimolecular in entry 7 and 8 ).

The yields when employing ynone $\mathbf{2 a}$ as the acceptor happened to be higher as compared with the parent ynals (see Table 3 for a comparison). This could be attributed to a large extent to the higher conversion rates obtained in the reactions involving propargylic ketoester $\mathbf{2 a}$.

Table 6. Catalyst screening for the reaction between 3A and 2a

Figure 6.

The syn/anti ratio was determined by chiral HPLC analysis (Chiralpack IA, hex: $: \operatorname{Pr} 95: 5,0.5 \mathrm{~mL} / \mathrm{min}, \lambda=240 \mathrm{~nm}$ ) of the reaction crude (Figure 7) comparing the peak areas of the syn- (major, 20.9 and 29.3 min ) and anti-adduct (minor, 24.7 min and 32.8 min ).

syn-9Aa

Figure 7.

The absolute configuration of compound 9Aa was established by a single crystal X-ray analysis and for the remaining adducts was assumed based on a uniform reaction mechanism. The configuration of the molecule happened to be $(2 S, 3 S)$, as it is shown in the ORTEP diagram of the molecule in Figure 8.

Figure 8.

### 2.3.2. Reaction scope

The generality of the method was explored using a selection of propargylic ketoesters (2) with a range of enolizable aldehydes (3), under the optimized conditions, namely: the acceptor ynone was dissolved in THF $(1 \mathrm{M})$ at $-40^{\circ} \mathrm{C}$ and 1.5 equivalents of the donor aldehyde and $20 \mathrm{~mol} \%$ of each catalyst $\mathbf{C 1}$ and benzoic acid were added. The reaction mixture was stirred at the same temperature, and after verifying by ${ }^{1} \mathrm{H}$ NMR analysis of an untreated reaction sample that the reaction finished ( 48 h ), the mixture was treated with $\mathrm{HC}\left(\mathrm{OCH}_{3}\right)_{3}$ (3 equivalents) in the presence of $p$ TSA at $0{ }^{\circ} \mathrm{C}$ for 2 h . The corresponding dimethyl acetal products were isolated by flash column chromatography on silica gel eluting with hexane/THF mixtures.

As data in Table 7 show, the reactions proceeded smoothly with various donor aldehydes $\mathbf{3}$, affording the corresponding tertiary propargylic alcohols in good yield, diastereoselectivity of 1:5 or higher, and enantioselectivities above $93 \%$ ee in most cases. These examples include ynones bearing substituents at the ortho or metha positions of the phenyl ring (Table 7, entries 2 and 3). However, meta-tolyl susbsituted ynone $2 \mathbf{d}$ (Table 7, entry 4) was an exception and led to the corresponding adduct 9Ad with decreased enantioselectivity.

Table 7. Cross-aldol reaction scope between enolizable aldehydes and propargylic $\alpha$-ketoesters ${ }^{\left[{ }^{[a]}\right.}$

[a] Reactions conducted on a 0.5 mmol scale in 0.5 mL of $\mathrm{THF}\left(\mathbf{3} / \mathbf{2} / \mathbf{C 1} / \mathrm{PhCO}_{2} \mathrm{H}\right.$ molar ratio $=$ 1.5:1:0.2:0.2). [b] Combined yield of syn/anti adducts after chromatography. [c] $d r$ values determided by HPLC analysis of the crude product. [d] ee of major (syn) isomer, determined by chiral HPLC.

### 2.3.3. Elaboration of adducts

Once a method for the stereoselective cross-aldol reaction between enolizable aldehydes and propargylic $\alpha$-ketoesters was developed, some possibilities for the transformation of the adducts were briefly explored.

### 2.3.3.1. Reduction of adducts 9Aa and 9Ca

As stated in the Introduction, the alkyne moiety could in principle be transformed into the corresponding alkyl and alkenyl units via total or partial reduction, respectively. To corroborate this assertion, adduct 9Ca was submitted to hydrogenation over Pd on charcoal (Scheme 14) to afford the reduction product 10 in $76 \%$ yield. The same process applied to adduct 9Ba also produced an identical adduct, which proved the stereochemical uniformity of the adducts. It is worth noting that $\mathbf{1 0}$ is the adduct formally derived from the cross-aldol reaction between two enolizable carbonyl compounds, a reaction that cannot be carried out efficiently in a direct manner so far.

formal disconnection (yet unrealized direct coupling)

## Scheme 14.

### 2.3.3.2. Pauson-Khand reaction

Following the successful intramolecular Pauson-Khand cyclization reaction developed using secondary propargylic carbinols, the corresponding transformation using tertiary alcohol 9Aa was attempted.

The first problem was the protection of the tertiary alcohol, which turned out to be a challenging task. Indeed, we were unable to get the corresponding TIPS derivative, even at room temperature. Thus protection of the tertiary alcohol with the TMS group was performed instead, using TMSCl, DMAP and TEA (Scheme 15), which led to the protected alcohol $\mathbf{1 1}$ quantitatively.

Scheme 15.

The Pauson-Khand reaction was then performed under the previously described conditions, thus treatment of $\mathbf{1 1}$ with dicobalt octacarbonyl and TMANO in dichloromethane at room temperature afforded a diastereomeric mixture of bicyclic products $\mathbf{1 2}$ and $\mathbf{1 2}^{\prime}$ in $32 \%$ and $21 \%$ isolated yields, respectively.

Scheme 16.

Thus, this study gives a convenient entry to fused cyclopentene rings, structural frameworks present in natural sesquiterpene products (Figure 9). ${ }^{120}$

Silphiperfolane

Capnellene

Cedrene

Figure 9.

### 2.3.4. Reaction stereochemistry

Based on previous stereochemical models for related enamine mediated aldol reactions, ${ }^{127}$ we propose an open model similar to that proposed before for ynals (Scheme 13, page 67) that explains the observed stereoselectivity (Scheme 17). Assuming that the enamine adopts preferentially the most stable E-anti conformation two possible approaching orientations $\mathbf{A}$ and $\mathbf{B}$ should be considered. From these models A appears to be sterically less congested owing to the presumed higher interaction of the ester group with the bulky substituents of the enamine as compared to the alkyne group, with linear geometry. This model is in good agreement with the observed preferential formation of the syn-aldol.

[^36]

Scheme 17.

### 2.4.Conclusions

In this Chapter we have demonstrated that the direct cross-aldol reaction of enolizable aldehydes with propargylic aldehydes can be performed efficiently and with very good diastereo- and enantioselectivity via enamine activation. Key for this development is the concurrent use of $\alpha, \alpha$-dialkylprolinol ether / Brønsted acid catalytic system. The method is quite general with respect to the propargylic aldehyde substrate, and has been extended to the unprecedented reaction of aldehydes with propargylic ketoesters, affording the corresponding tertiary propargylic alcohols in good yield and selectivity.

In addition, the observed stereochemical outcome of the aldol reaction can be explained by involving open models similar to previously reported for related aldol reactions.

Furthermore, the use of $\omega$-unsaturated aldehydes as nucleophiles afforded the corresponding $1, \omega$-enyne adducts, which bear an additional alkene group compared to adducts obtained from simple aliphatic aldehydes, thus making feasible the application of these adducts in a wider variety of transformations.

In this sense, transformation of the resulting 1,6-enyne structures to the corresponding polisubstituted bicyclic enones through an intramolecular Pauson-Khand reaction has been realized. This reaction proceeds with essentially perfect diastereoselectivity in the case of ynal-derived adducts when using the $O$-TIPS protected propargylic alcohols and less selectively with an $O$-TMS protected tertiary enyne alcohol studied.

Finally, the hydrogenation of the triple (and double) bonds in adducts have been performed successfully, demonstrating the validity of the method for obtaining adducts that are formally derived from a cross-aldol reaction that cannot yet be performed directly in an efficient manner.

## Brønsted base-catalyzed $\alpha$-functionalization of carbonyl compounds

### 3.1.Development of $\boldsymbol{\alpha}^{\prime}$-oxy enones as acrylate equivalents

### 3.1.1. Precedents and objectives

As stated in the introduction, asymmetric catalyzed conjugate additions to simple $\alpha, \beta$-unsaturated esters and amides remain challenging, mainly due to their attenuated reactivity. In order to overcome this limitation, one of the working approaches is the development of $\alpha, \beta$-unsaturated ester and amide surrogates possessing certain qualities: i) enhanced activation of the substrate towards nucleophilic attack, ii) improved coordination to the catalyst, and iii) easy removal of the activating group.

The underlying idea is that coordination of one lone pair of the oxygen in the template to the catalyst (a Lewis acid or H -bond donor) would trigger the reaction. In this sense, monodentate acyl templates may lead to two possible substrate-catalyst geometries, complicating stereocontrol. On the contrary, bidentate templates would not only coordinate more efficiently, but also skip such degeneracy forming one preferential cyclic geometry, thus facilitating good reaction stereocontrol (Figure 1).

Monodentate templates

Bidentate templates

Figure 1.

Following this idea, several two-point binding $\alpha, \beta$-unsaturated acyl templates have been developed during the last years, ${ }^{128}$ which may be divided in two categories: heteroatom-linked templates (Figure 2a) and carbon-linked templates (Figure 2b). However, at the outset of this project only scarce examples of conjugate addition of enolizable carbonyl compounds to these enoate surrogates leading to the formation of a stereogenic center at $\mathrm{C}_{\alpha}$ were reported.

[^37]
## a) Heteroatom-linked templates

b) Carbon-linked templates

Figure 2.

Whilst efforts to control stereoselectivity from $\alpha, \beta$-unsaturated carbonyl compounds have been mainly focused on carboxylic acid derivatives, essentially no reports concerning the use of ketones have been described in the literature. One exception is the strategy developed by Enders, ${ }^{135}$ where hydrazones are used as ketone surrogates. In this context, some years ago, our group reported chiral $\alpha$ '-oxy ketones and enones as acyl equivalents useful for several diastereoselective reactions. ${ }^{136}$ The

diastereoselective Michael addition of $\beta$-ketoesters to chiral $\alpha$ '-hydroxy enones resulting on the formation of challenging quaternary stereocenters is shown in Scheme 1 as a representative example. ${ }^{136 \mathrm{~g}}$

Scheme 1.

On the other hand, achiral $\alpha^{\prime}$-hydroxy enones have also been developed in our group as acrylate equivalents in chiral Lewis acid-catalyzed enantioselective reactions. For instance, an enantioselective version of the conjugate addition of $\beta$-ketoesters above mentioned was reported ${ }^{136 \mathrm{~g}}$ employing a $\mathrm{C}_{2}$-symmetric diamine-copper complex as the catalyst (Scheme 2).

Scheme 2.

This and additional research from this laboratory has revealed that achiral $\alpha^{\prime}$ hydroxy enones are excellent bidentate Michael acceptors for metal-catalyzed

asymmetric transformations, ${ }^{137}$ specially for the 1,4 -addition of N - and C -centered nucleophiles. ${ }^{138}$

Interesting features of the $\alpha^{\prime}$-hydroxyketone template are: i) The salient behaviour in asymmetric catalysis due to the ability of the $\alpha$-hydroxy carbonyl (or ketol) moiety for efficient 1,4-metal binding; ii) the gem-dialkylcarbinol framework of the template can be easily modified for optimal performance (Scheme 3a), and ii) the Michael adducts can be further elaborated under smooth oxidative conditions (Scheme 3b) affording carboxylic acids, aldehydes and ketones from a single common intermediate.
a)

Scheme 3.

Despite these features, however, construction of quaternary centers ${ }^{139}$ through Michael reactions was still problematic with these enones, especially under Lewis acid catalysis as noted above. In general, this reaction is limited to highly active donor substrates, that is, substrates capable of easily generating the enol form, such as $\beta$ ketoesters. Generation of the more nucleophilic enolate species through deprotonation by a tertiary amine base is usually unfruitful because of self-quenching of the Lewis acid-Lewis base pair. With very few exceptions, this combined use of a base and acid for concomitant substrate activation is a general problem that still remains not well

[^38]resolved. ${ }^{140}$ A practical solution to this problem is suppressing the Lewis acid and carrying out the reaction in the presence of a bifunctional Brønsted base/H-bond donor catalyst. In this instance, the electrophile would be activated by hydrogen bonding whilst the donor substrate would be activated by the Brønsted base through a model that resembles that of the Lewis acid, as shown in Figure 3.

### 3.1.1.1. Preparation of the $\alpha$ '-oxy enones used in the study

An interesting practical aspect of these enones is that they may be readily prepared from commercially available compounds, in the majority of the cases in few steps, and purified by simple flash column chromatography to be obtained as colourless oils, which can be stored for several months at $-30^{\circ} \mathrm{C}$. For example, $\alpha$ '-hydroxy enone 13a was synthesised starting from methoxypropadiene through addition of its lithium salt to acetone and subsequent acid treatment in good yield (Scheme 4, method A). ${ }^{141}$ Alternatively, it could also be prepared in high yield from commercially available 3-hydroxy-3-methyl-2-butanone via aldol condensation with formaldehyde, formed in situ from paraformaldehyde ${ }^{142}$ (Scheme 4, method B). Enone 13a was silylated by mixing it with 3-(trimethylsilyl)-2-oxazolidinone (TMSO) ${ }^{143}$ and a few drops of trifluoroacetic acid and stirring at room temperature without any solvent, affording $\alpha$ '-silyloxy enone 13b in excellent yield.

[^39]

Scheme 4.

The $O$-triethylsilyl substituted enone 13c was prepared starting from methyl 2hydroxyisobutyrate. ${ }^{144}$ In a first step, the alcohol was protected as the corresponding triethyl silyl ether, and the resulting product was converted into the dimethyl phosphoester intermediate. The Wittig-Horner reaction with formaldehyde afforded the desired enone 13c in good overall yield (Scheme 5).

## Scheme 5.

$\beta$-Aryl $\alpha$ '-hydroxyenones $\mathbf{1 4 a}$-14d were obtained by aldol condensation of the commercially available 3-hydroxy-3-methyl-2-butanone with the corresponding aryl aldehyde (Scheme 6). ${ }^{144}$ The reaction was carried out under reflux using lithium hydroxide as the base and a mixture of $\mathrm{MeOH} /$ water as the solvent, affording exclusively the corresponding $E$-enones in high yield.

Scheme 6.

[^40]$\beta$-Alkyl $\alpha$ '-hydroxyenone $\mathbf{1 4 e}$ was obtained in an overall moderate yield following the procedure described above for enone 13c, employing trimethylsilyl chloride in the first step and performing the Wittig-Horner reaction with propanal, followed by desilylation with hydrofluoric acid in methanol (Scheme 7). ${ }^{144}$

14e, $56 \%$

Scheme 7.

For the synthesis of $\alpha$-methyl $\alpha$ '-hydroxy enone 15 , the commercially available 2-methoxy-2-propanoate was transformed into the Weinreb amide, which was then reacted with isopropenyl magnesium bromide, yielding the desired enone in moderate yield after two steps (Scheme 8). Posterior silylation under the conditions previously employed for the formation of unsubstituted enone $\mathbf{1 3 b}$ afforded enone $\mathbf{1 5}^{\prime}$ in good yield.

## Scheme 8.

Dienone 16 was prepared in good yield starting from 3-hydroxy-3-methyl-2butanone through aldol reaction with acrolein and in situ mesylation and elimination. The posterior silylation of $\mathbf{1 6}$ with TMSO afforded $\mathbf{1 6}^{\prime}$ ' in excellent yield.

Scheme 9.

### 3.1.2. Conjugate additions: Previous results from this laboratory

With these templates in hand, their behaviour in organocatalytic reactions with several nucleophiles was studied in parallel. Dr. Badiola and Dr. Olaizola from this laboratory studied their reactions with $\alpha$-cyanoacetates, azlactones and 5H-thiazol-4ones respectively (Scheme 10). ${ }^{145}$

Scheme 10.

### 3.1.3. 1,4-Addition of oxazolones to $\alpha$ '-oxy enones

To complete these studies and with the aim to show the potential scope of these enones in asymmetric conjugate additions, we planned to evaluate the reaction with 5 H -oxazol-4-ones (oxazolones), which would generate $\alpha$-hydroxy carboxylic acid derivatives with a tetrasubstituted stereogenic center. These compounds are important

[^41]building blocks in pharmaceutical products and biologically active compounds. ${ }^{146} 5 \mathrm{H}-$ oxazol-4-ones were first introduced in asymmetric catalysis by Trost and subsequently used by several other groups.

In 2004 Trost and coworkers ${ }^{147}$ reported the Mo-catalyzed asymmetric allylic alkylation of oxazolones (Scheme 11), which yielded 5,5-dialkyl oxazol-4-ones in high yield, good regio- and diastereoselectivity and high enantioselectivity. Posterior basic hydrolysis of the adducts afforded the corresponding chiral $\alpha$-hydroxyamides.

Scheme 11.

Examples of catalytic asymmetric aldol ${ }^{148}$ and Mannich-type ${ }^{149}$ reactions of oxazolones have also been seldom reported. However, the conjugate addition has been studied more exhaustively as shown in the examples that follow.

Misaki and Sugimura ${ }^{150}$ performed the 1,4 -addition of 5 H -oxazol-4-ones to alkynyl carbonyl compounds catalyzed by chiral guanidines (Scheme 12Table 3),

[^42]obtaining the corresponding conjugate addition adducts in moderate yield, variable $E / Z$ selectivity and high enantioselectivity.

## Scheme 12.

In another relevant example, Ye et al. ${ }^{151}$ reported the bifunctional Brønsted basecatalyzed Michael addition of oxazolones to $\alpha, \beta$-unsaturated ketones (Scheme 13). The thiourea-sulfonamide catalyst rendered the Michael reaction adducts in excellent yield, diastereo- and enantioselectivity.

Scheme 13.

In 2013 and using a similar thiourea catalyst lacking the sulfonamide group the group of Jiang ${ }^{152}$ reported the conjugate addition of oxazolones to aromatic nitroalkenes that proceeds in excellent yield, diastereo- and enantioselectivity (Scheme 14).

Scheme 14.

However, to the best of our knowledge, at the outset of this project no examples had been reported on the catalytic asymmetric conjugate addition of oxazolones to unsaturated esters or equivalents. Only two examples were described in the literature during the progress of this Thesis.

In the first one, Misaki and Sugimura ${ }^{150 b}$ described the 1,4 -addition reaction of oxazolones to an allenic phenyl ester catalyzed by a chiral guanidine/alcohol in excellent yield and enantioselectivity (Scheme 15).

## Scheme 15.

The second work appeared just after our initial results were published. ${ }^{145}$ Wang et al. ${ }^{153}$ reported the conjugate addition of oxazolones to $\alpha, \beta$-unsaturated acyl imidazoles catalyzed by a dinuclear zinc complex, obtaining the corresponding adducts in high yield, diastereo- and enantioselectivity (Scheme 16a). They also performed the transformation of an adduct to the corresponding carboxylic methyl ester, affording the product in low yield (Scheme 16b).

[^43]

Scheme 16.

### 3.1.3.1. Unsubstituted $\alpha$ '-oxy enones as electrophiles

Initially the reaction of oxazolone $\mathbf{1 7 A}$ with a variety of unsubstituted $\alpha^{\prime}$-oxy enones ( $\mathbf{1 3 a - 1 3 c}$ ) catalyzed by a squaramide catalyst was investigated. For this purpose C7, ${ }^{154}$ the optimal catalyst for $\alpha$-cyanoacetates, ${ }^{145}$ was taken as a model in order to find the optimum structure of the Michael acceptor (Table 1). Reaction with the free hydroxyl enone 13a at $-40^{\circ} \mathrm{C}$ yielded an almost racemic addition product (Table 1, entry 1). In its turn, reaction with the $O$-TMS substituted enone 13b afforded, after subsequent desilylation, the desired adduct $\mathbf{1 8 A}$ in good yield and moderate $e e$ (Table 1, entry 2). An increase of the temperature from -40 to $-20^{\circ} \mathrm{C}$ was found to be beneficial both for the yield and enantioselectivity of the reaction (entries 3 and 4), perhaps due to the better solubilisation of the catalyst. Enone 13c, bearing a bulkier $O$-protecting group, was also examined but the product was obtained in low enantiomeric excess (entry 5). Thus reaction with $\alpha$ 'silyloxy enone 13b at RT was selected for further optimization.

[^44]Table 1. Screening of template structure for the $\mathbf{C 7}$-catalyzed reaction with oxazolone $\mathbf{1 7 A}\left(R^{1}={ }^{i} B u\right)^{[a]}$

[a] Reactions conducted on a 0.3 mmol scale in 0.9 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $\mathbf{1 7 A} / \mathbf{1 3} / \mathbf{C 7}$ molar ratio $=1: 1.5: 0.2$ ). [b] Isolated yield after chromatography. [c] Determined by chiral HPLC.

Next, a variety of Brønsted base-catalysts for the reaction of oxazolone 17A with $\alpha$ '-silyloxy enone 13b were tested at RT (Table 2). Using thiourea catalyst C9, ${ }^{155}$ compound 18A was obtained in good yield but in very low $e e$. Then, other chiral scaffolds were tested: Using C10, ${ }^{156}$ derived from a chiral diamine with $\mathrm{C}_{2}$-symmetry, the desired product was obtained in good yield and moderate ee. To our delight catalyst C8, ${ }^{157}$ derived from L-tert-leucine, afforded the Michael reaction adduct 18A in good yield and excellent $e e$. When using (DHQD) $)_{2} \mathrm{PYR}$ (C11) as the catalyst a very low conversion was observed, suggesting that the H-bond donor functionality of the catalyst is necessary for the activation of the reaction substrates.

[^45]Table 2. Catalyst screening for the reaction of 17A with $\alpha^{\prime}$-oxy enone $\mathbf{1 3 b}^{[a]}$

[a] Reactions conducted on a 0.3 mmol scale in 0.9 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{1 7} \mathbf{A} / \mathbf{1 3 b} / \mathrm{cat}$. molar ratio $=1: 1.5$ :
0.2 ). Isolated yield after chromatography. ee determined by chiral HPLC.

After performing the optimization of conditions for the model reaction, the reaction of oxazolones $\mathbf{1 7 A} \mathbf{- 1 7 E}$ with $\alpha^{\prime}$-oxy enone $\mathbf{1 3 b}$ was carried out following the next standard procedure: the oxazolone was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.33 \mathrm{M})$ and 1.5 equivalents of the enone and $20 \mathrm{~mol} \%$ of the catalyst $\mathbf{C 8}$ were added. The reaction mixture was stirred at room temperature, and after verifying total conversion (TLC monitoring, 24-48 h), the mixture was treated with HF $48 \%$ (aq.) at the same temperature for 45 min . The corresponding Michael reaction adducts were isolated by flash column chromatography on silica gel eluting with hexane/acetate mixtures.

As the results in Table 3 show, the reaction proceeded in good yield with different alkyl-substituted oxazolones, including those with $n$-alkyl (18B-18D) and benzyl substituents (18E), and the lowest enantioselectivity was $92 \% e e$.

Table 3. Michael reaction scope between oxazolones and $\alpha^{\prime}$-oxy enone $\mathbf{1 3 b}^{[a]}$

[a] Reactions conducted on a 0.3 mmol scale in 0.9 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{1 7} / \mathbf{1 3 b} / \mathbf{C 8}$ molar ratio $=1: 1.5: 0.2)$. Isolated yield after chromatography. ee determined by chiral HPLC.

### 3.1.3.2. $\quad \beta$-Substituted $\alpha$ '-oxy enones as electrophiles

Following the study on the Michael addition of oxazolones to unsubstituted $\alpha^{\prime}$ oxy enones, we decided to study the addition to $\beta$-substitutted $\alpha^{\prime}$-oxy enones. Now a relatively diminished reactivity of the enone was expected as compared with the unsubstituted analogue, and on the other hand, the problem of the relative configuration of the newly generated tetra- and trisubstituted contiguous stereocenters arises. This time the reaction between oxazolone 17E and $\beta$-aryl $\alpha$ '-hydroxy enone 14a was taken as a model to test a variety of catalysts (Table 4). 1,2-Dichloroethane was used as the solvent so the reaction could be performed at temperatures higher than $40^{\circ} \mathrm{C}$ in order to compensate for the expected lower reactivity of $\beta$-substitutted $\alpha$ '-oxy enones. When using squaramide $\mathbf{C} 7$ as the catalyst at room temperature a very low conversion was observed after 48 h (Table 4, entry 1). When increasing the temperature from RT to 50 ${ }^{\circ} \mathrm{C}$ only moderate conversion was observed after 48 h , but good diastereoselectivity and enantioselectivity were obtained (Table 4, entry 2). Very low conversions were obtained with the analogous thiourea C9 (entry 4) and also with the L-tert-leucine derived squaramide C8 (entry 3). The reaction with catalyst $\mathbf{C 1 2}{ }^{154 b}$ afforded the Michael addition product 19Ea in similar selectivity to catalyst C7, but a slightly lower
reactivity was observed (entry 5). On the other hand, increasing the reaction temperature to $70^{\circ} \mathrm{C}$ when using catalyst $\mathbf{C} 7$ allowed the reaction to proceed to complete conversion within 48 h affording the desired Michael addition adduct 19Ea in high yield and excellent diastereo- and enantioselectivity.

Table 4. Condition optimization for the reaction of $\mathbf{1 7 E}$ with $\alpha^{\prime}$-oxy enone $\mathbf{1 4 a}{ }^{[a]}$
(2)
[a] Reactions conducted on a 0.3 mmol scale in 0.9 mL of 1,2-DCE (17E/14a/cat molar ratio $=$ 1:3:0.1). [b] Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy on reaction aliquots before workup. [c] Combined yield of both isomers after chromatography. [d] Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy. [e] ee of major isomer, determined by chiral HPLC.

The conversion was determined by ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) analysis of untreated samples of the reaction (Table 4, entry 4; Figure 4). Comparing the peak areas of the
$\mathrm{C}_{\alpha}$-proton of oxazolone $\mathbf{1 7 E}(4.77 \mathrm{ppm}, 1 \mathrm{H})$, and the protons of the methyl substituent at the aromatic ring of adduct $19 \mathrm{Ea}(2.24 \mathrm{ppm}, 3 \mathrm{H})$.

17E

Figure 4.

The diastereomeric ratio was determined by ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) analysis of the reaction crude (Figure 5) comparing the peak areas of the protons of the methyl substituent at the aromatic ring of the adduct ( 2.24 ppm for major and 2.21 ppm for minor).

Figure 5.

epi-19Ea

Once the optimized conditions were found, the reaction of oxazolones $\mathbf{1 7 A}$ and 17E with $\alpha$ '-hydroxy enones $\mathbf{1 4 a - 1 4 d}$ was carried out following the next standard procedure: the oxazolone was dissolved in 1,2-dichloroethane ( 0.33 M ) and 3
equivalents of the enone and $10 \mathrm{~mol} \%$ of the catalyst $\mathbf{C} 7$ were added. The reaction mixture was stirred at $70^{\circ} \mathrm{C}$, and after verifying reaction completion (TLC monitoring, 48 h ), the corresponding Michael adduct was isolated as a mixture of diastereomers by flash column chromatography on silica gel eluting with hexane/acetate mixtures.

The data in Table 5 show that the reaction also proceeded in good yield for the 5-iso-butyl substituted oxazolone (adduct 19Aa), although a slightly lower yield was obtained as a consequence of an incomplete conversion. Higher steric impediment of the alkyl chain of $\mathbf{1 7 A}$ as compared to the alkyl chain of $\mathbf{1 7 E}$ could be a possible cause. On the other hand, $\beta$-aryl $\alpha^{\prime}$-hydroxy enones with electron-donor (19Ec) and withdrawing (19Eb) groups were well tolerated. Furthermore, the $d r$ was higher than 12:1 in all cases, and the lowest enantiomeric excess for the major diastereomer was $96 \%$. Unexpectedly, $\beta$-alkyl substituted $\alpha^{\prime}$-hydroxy enones seemed to be unreactive under these reaction conditions (19Ee). This is especially curious taking into account that the trend for the reaction with $\alpha$-cyanoacetates is just the opposite, with $\beta$-alkyl substituted $\alpha^{\prime}$-hydroxy enones being the most reactive (Scheme 17). ${ }^{158}$

[^46]Table 5. Michael reaction scope between oxazolones and $\beta$-substituted $\alpha$ '-hydroxy enones ${ }^{[a]}$

19Aa, 67\% yield $d r=13: 1,99 \% e e$

19Ec, 81\% yield $d r=12: 1,96 \%$ ee

19Ea, $80 \%$ yield $d r=13: 1,96 \%$ ee

19Eb, 78\% yield $d r=12: 1,96 \%$ ee
[a] Reactions conducted on a 0.15 mmol scale in 0.45 mL of 1,2-DCE (17/14/C7 molar ratio $=$ 1:3:0.1). Combined yield of both isomers after chromatography. $d r$ determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy. ee of major isomer determined by chiral HPLC.

Scheme 17.

### 3.1.3.3. $\alpha$-Substituted $\alpha$ '-oxy enones as electrophiles

The method was also extended to the reaction with $\alpha$-substituted $\alpha^{\prime}$-oxy enones. This reaction would lead to the formation of two nonadjacent stereogenic centers which, unlike in the case of $\alpha$ '-oxy enones examined above, are created in two different steps. The stereogenic center at $\mathrm{C}_{\alpha}$-atom of oxazolone is formed during the addition step ( $\mathrm{C}-\mathrm{C}$ bond forming step), and the second stereocenter is subsequently formed upon protonation of the resulting enolate. This is a complication since here asymmetric induction from the diol substrate and the catalyst may or may not be convergent. In the protonation step, the asymmetric induction of both the catalyst and the stereogenic center of the substrate are expected to play an important role (Scheme 18).

Scheme 18. Protonation step

Initially the reaction between oxazolone $\mathbf{1 7 E}$ and $\alpha$-methyl $\alpha^{\prime}$-oxy enones ( $\mathbf{1 5}$, $\mathbf{1 5}^{\prime}$ ) in the presence of catalyst $\mathbf{C 7}$ was taken as a model to optimize the Michael reaction conditions (Table 6). The reaction at room temperature led to low conversions, even after 72 h (Table 6, entry 1). By increasing the temperature to $50{ }^{\circ} \mathrm{C}$ better conversions were obtained, and the desired adduct $\mathbf{2 2 E}$ was obtained in moderate yield, low diastereoselectivity, and moderate enantioselectivity (Table 6, entry 2). Further increase of the temperature afforded similar results, but with a slightly lower diastereoselectivity (Table 6, entry 3). When the reaction was attempted with the $O$ trimethylsilyl derivative $\mathbf{1 5}^{\prime}$, no reaction was observed (Table 6, entry 4).

Next, we tested a selection of catalysts, starting with the squaramide catalyst C8, which afforded the desired adduct 22 E in similar selectivity to $\mathbf{C} 7$, but in conversions lower than $50 \%$ (Table 6, entry 5). Thiourea catalyst C9 exhibited an inferior catalytic capacity (Table 6, entry 6). It was gratifying to observe that using catalyst C13, which bears an additional amide group for further H -bonding, a good conversion was observed and the corresponding product was obtained in very good enantioselectivity ( $92 \%$ ) (Table 6, entry 7). Unfortunately, none of the tested catalysts afforded diastereomeric ratios higher than 2:1.

Table 6. Condition optimization for the reaction of $\mathbf{1 7 E}$ with $\alpha$-methyl $\alpha^{\prime}$-oxy enones ${ }^{[a]}$

Entry

[^47]The diastereomeric ratio was determined by ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) analysis of the reaction crude (Figure 6) comparing the peak area of the proton at the $\alpha$-position of the diastereomer adducts ( 3.27 ppm for minor and 3.13 ppm for major).

Figure 6.

Catalyst C13 was prepared in good yield in four routinely steps according to the method described in Scheme 19. ${ }^{159}$

Scheme 19.

As illustrated in Scheme 20, an alternative approach was also developed in our group ${ }^{160}$ for the synthesis of C13. This approach takes the advantage that different

[^48]catalysts of this type may be prepared via a single common squaramide carboxylic acid precursor.

Scheme 20.

Once the optimized conditions were found, the reaction of oxazolones 17B-E with $\alpha^{\prime}$-hydroxy enone $\mathbf{1 5}$ was carried out following the next standard procedure: the enone was dissolved in 1,2-dichloroethane ( 0.33 M ) and 2 equivalents of the oxazolone and $10 \mathrm{~mol} \%$ of the catalyst $\mathbf{C 1 3}$ were added. The reaction mixture was stirred at $50^{\circ} \mathrm{C}$, and after verifying that the reaction stopped ( ${ }^{1} \mathrm{H}$ NMR monitoring, 72 h ), the crude material was purified by flash column chromatography on silica leading to a mixture of diastereomers.

The results in Table 7 show that the reaction proceeded in good yield for the four different oxazolones tested. However, enantioselectivity seems to be very substratedependent, as oxazolones with a longer alkyl chain (Bn, $90 \%$ ee; hex, $92 \%$ ee) provided the highest enantioselectivity, while oxazolones with a small side chain afforded lower selectivity ( $\mathrm{Pr}, 80 \% e e ; \mathrm{Me}, 70 \% e e$ ). Furthermore, the $d r$ was lower or equal to 2:1 in all cases.

Table 7. Michael reaction scope between oxazolones and $\alpha$-methyl $\alpha$ '-hydroxy enone $\mathbf{1 5}^{[a]}$

[a] Reactions conducted on a 0.15 mmol scale in 0.45 mL of 1,2-DCE ( $\mathbf{1 7 / 1 5} / \mathbf{C 1 3}$ molar ratio $=2: 1: 0.1$ ). Combined yield of both isomers after chromatography. $d r$ determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy. ee of major isomer determined by chiral HPLC.

While this work was ongoing, Misaki and Sugimura ${ }^{161}$ reported the asymmetric conjugate addition of oxazolones to $\alpha$-chloroacrylonitrile, obtaining the corresponding $\alpha$-chloronitriles in excellent yield and diastereoselectivity and high enantioselectivity (Scheme 21).

[^49]

## Scheme 21.

### 3.1.3.4. Elaboration of adducts

In order to validate the $\alpha$ '-hydroxy ketone functionality as a carboxylic acid surrogate, the oxidation of the ketol moiety by using cerium ammonium nitrate (CAN) was carried out. The corresponding carboxylic acids 23-26 were obtained in high yield and without loss of optical purity (Scheme 22).

## Scheme 22.

Carboxylic acid 23 was further derivatized to afford known $\gamma$-lactone $\mathbf{2 8},{ }^{162}$ which served to determine the configuration of adduct $\mathbf{2 3}$ and its precursor 18C as $R$ (Scheme 23). Configuration of the remaining adducts $\mathbf{1 8}$ was assigned by assuming a uniform reaction mechanism.

[^50]

## Scheme 23.

A crystalline sample of adduct 19Eb was obtained by crystallisation from a mixture of hexane/ethyl acetate and then its absolute configuration was established by a single crystal X-ray analysis thus confirming initial assignment (Figure 7).

Figure 7.

On the other hand, chemical correlation between adduct $18 \mathbf{E}$ and $22 \mathbf{E}$ as indicated in Scheme 24 demonstrated again that the newly generated stereocenter at the oxazolone C5 position is the same in both reactions.

Scheme 24.

### 3.2. 1,6-Additions to $\alpha^{\prime}$-oxy dienones

After developing a robust method for the asymmetric 1,4-addition reactions, the investigation of the nucleophilic addition at more remote positions of polyunsaturated $\alpha^{\prime}$-oxy ketones was the next logical step.

### 3.2.1. Precedents and objectives

At the outset of this project there were only two precedents in the literature involving catalyst-controlled direct stereoselective 1,6 -addition reactions of enolizable nucleophiles leading to the formation of a stereogenic center at $\mathrm{C}_{\alpha}$ : On the one hand, Jørgensen and coworkers ${ }^{163}$ reported the regio- and stereoselective addition of cyclic $\beta$ ketoesters and iminoesters to diverse unsubstituted diunsaturated electrophiles under phase-transfer conditions with excellent results (Scheme 25a). On the other hand, Ooi et al. ${ }^{164}$ performed the 1,6 - and 1,8 -addition of azlactones to polyunsaturated $\gamma$ - and $\zeta$-alkyl N -acylpyrroles respectively catalyzed by a triaminophosphorane catalyst with high levels of regio- and stereocontrol, and later extended the substrate scope to diunsaturated $\gamma$-aryl $N$-acylpyrroles (Scheme 25b). ${ }^{165}$

b)

## Scheme 25.

[^51]Moreover, while the project was ongoing Feng and coworkers reported the scandium-catalyzed asymmetric 1,6-addition of 3-substituted oxindoles to dienyl ketones in excellen selectivity (Scheme 26).

Scheme 26.

Taking into account the scarcity of methods, the viability of the asymmetric 1,6conjugate addition of enolizable carbonyl compounds to $\alpha$ '-oxy dienones was attempted (Scheme 27).

## Scheme 27.

The realization of this objective possessed several challenges to overcome: i) the control of the face selectivity at sites remote from the coordination point, ii) the diminished reactivity of $\alpha^{\prime}$-oxy dienones as compared to the parent unsubstituted $\alpha^{\prime}$-oxy enones and iii) the control of the 1,4 vs 1,6 addition.

The goal was to identify the factors that govern the different reactivity and selectivity aspects of this transformation.

### 3.2.2. Oxazolones as nucleophiles

The suitability of a catalytic 1,6 -addition process involving our dienones was first evaluated by using oxazolone $\mathbf{1 7 E}$ and $\alpha^{\prime}$-oxy dienones $\mathbf{1 6}$ and $\mathbf{1 6}^{\prime}$ in the presence of several Brønsted base catalysts (Table 8). In a first run the reaction was carried out under the conditions developed for the Michael reaction of oxazolones with $\beta$-aryl $\alpha$ 'hydroxy enones. Under these conditions ( $\mathbf{C} 710 \mathrm{~mol} \%, 70^{\circ} \mathrm{C}$ ) a $2: 1$ mixture of the $1,6-$ and 1,4 -addition products was obtained in low stereoselectivity (Table 8 , entry 1 ). In
light of this result, we decided to change the tertiary amine by a stronger basic functionality. The idea was that a stronger base would increase the amount of enolate present in the reaction media, thus accelerating the reaction and making feasible its performance under kinetic control, hopefully favouring the addition at the least sterically-hindered position ( $\delta$ ).

For that goal, a set of novel guanidine catalysts ( $\mathbf{C 1 4 - C 1 8 )}$ and phosphanimine C19 were synthesised. The reactions at $0{ }^{\circ} \mathrm{C}$ with guanidine catalysts C14-C18, afforded the 1,6 -addition adduct exclusively. However, enantioselectivity remained suboptimal in all the cases. For example guanidine C14, similar to the ones developed by Ishikawa, ${ }^{166}$ afforded the desired product in an almost racemic manner (Table 8, entry 2). Moreover, the use of catalysts $\mathbf{C 1 5 - C 1 7}$, including variations in the relative disposition of the stereogenic centers did not lead to substantial improvement of the enantioselection (entries 3, 5 and 7, respectively). The silylated dienone 16' was also tested in the reaction with catalysts $\mathbf{C 1 5 - C 1 7}$ (entries 4, 6 and 8, respectively), but reaction times became longer and similar $e e$ values to the ones obtained with dienone 16 were observed. When chiral guanidine $\mathbf{C 1 8}$, similar to the one described by Wang and $\mathrm{Qu},{ }^{167}$ was tested in the reaction (Table 8, entry 9), similar results were obtained. Finally, phosphanimine catalyst C19 was also employed in the reaction (Table 8, entry 10), but low conversion rates were observed.

[^52]Table 8. Catalyst screening for the reaction of oxazolone $\mathbf{1 7 E}$ with $\alpha^{\prime}$-oxy dienones ${ }^{[a]}$
(
[a] Reactions conducted on a 0.15 mmol scale in 0.45 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $\mathbf{1 7 E}$ /dienone/cat molar ratio $=1: 2: 0.1$ ). [b] Yield of combined isomers after chromatography. [c] Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy. [d] ee of compound 29, determined by chiral HPLC. [e] Reaction carried out at $70^{\circ} \mathrm{C}$ using 1,2-DCE as the solvent.

While this study was ongoing, Misaki and Sugimura ${ }^{168}$ reported a similar work where they performed the conjugate 1,6 -addition of oxazolones to simple dienones. The corresponding adducts were obtained in variable yield and excellent enantioselectivity as a mixture of $E / Z$ isomers (Scheme 28).

Scheme 28.

### 3.2.3. $\alpha$-Cyanoacetates as nucleophiles

At this point, we decided to switch from oxazolones to $\alpha$-cyanoacetates as nucleophiles, and the reaction of cyanoacetate $\mathbf{3 0}$ with $\alpha$ 'oxy dienone $\mathbf{1 6}$ was taken as a model to perform the catalyst screening (Table 9). Also some new catalysts C20-C25 were synthesised. To begin with, guanidine catalysts bearing the squaramide (C16), thiourea (C20) and ureidopeptide (C21) motifs were employed in the reaction, and although the 1,6 -addition adduct was formed exclusively, enantioselectivity near zero was obtained. When catalyst C18 was used for the reaction, some stereoselectivity was observed and therefore different catalysts bearing the same chiral guanidine structure were synthesised and tested. First, catalyst C22, with a different relative configuration, rendered the adduct in lower $e e$. On the other hand, catalyst $\mathbf{C 2 3}$, not bearing additional H-bonding groups, turned out to be an inefficient catalyst for the reaction. Finally, catalysts C24 and C25, with additional basic functionalities, rendered the desired product in good yield, but very low enantioselectivity.

[^53]Table 9. Catalyst screening for the reaction of cyanoacetate $\mathbf{3 0}$ with $\alpha^{\prime}$-hydroxy dienone $\mathbf{1 6}^{[a]}$

[a] Reactions conducted on a 0.15 mmol scale in 0.45 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{3 0} / \mathbf{1 6} /$ cat molar ratio $=$ 1:2:0.1). Isolated yield after chromatography. ee determined by chiral HPLC.

At this point, seeing the difficulties we were encountering in our quest for a catalyst that could effectively control the enantioselectivity of the 1,6-addition reaction, we decided to provisionally put the project aside to focus on other goals.

### 3.3.Regio-, diastereo- and enantioselective functionalization of unactivated cyclic ketones

### 3.3.1. Precedents and objectives

Despite the great synthetic interest of chiral ketones, the direct asymmetric $\alpha$ functionalization of enolizable ketones remains challenging. This situation aggravates in the case of non-symmetrical unactivated ketones with two sites for deprotonation, in which the procedures for the catalytic asymmetric $\alpha$-carbofunctionalization are mostly limited to the use of either chiral auxiliaries or preformed enolates and equivalents. For instance, to the best of our knowledge, the direct catalytic stereoselective $\alpha$-arylation ${ }^{169}$ of these ketones is yet to be achieved, and only scarce examples of allylation ${ }^{170}$ and alkylation ${ }^{171}$ reactions have been reported so far.

Successful strategies for the $\alpha$-alkylation involving the use of primary amine catalysts have been independently reported by the groups of Carter ${ }^{172}$ and Kotsuki, ${ }^{173}$ but they require a high catalyst loading and harsh reaction conditions (Scheme 29). Furthermore, the substituent at $\mathrm{C}_{\alpha}$ is limited to the methyl, ethyl, $n$-propyl and benzyl groups, affording the adducts of the latter two in low yield ( $<35 \%$ ).

[^54]

b) Kotsuki

Scheme 29.

On the other hand, Toste ${ }^{174}$ and List ${ }^{175}$ have independently demonstrated the utility of chiral phosphoric acids as Brønsted acid catalysts for the regioselective asymmetric $\alpha$-carbofunctionalization of cyclic ketones with allenamides, allylic alcohols and $\alpha^{\prime}$-branched $\alpha, \beta$-unsaturated ketones (Scheme 30).

Scheme 30.

At the outset of this project, the only direct Brønsted base-catalyzed example in the literature for the regio- and stereoselective functionalization of ketones with two

[^55]distinct sites for deprotonation was the one reported by Wang, ${ }^{176}$ where the Michael reaction of $\alpha$-aryl substituted cyclopentanones with nitroalkenes was catalyzed by a chiral thiourea-sulfonamide catalyst (Scheme 31). The corresponding $\alpha$-alkylation adducts were obtained exclusively and in excellent yield, diastereo- and enantioselectivity. However, $\alpha$-phenyl cyclohexanone behaved sluggishly.

Scheme 31.

We decided to explore alternative strategies to provide a methodology for the $\alpha-$ functionalization of either cyclic or acyclic $\alpha$-substituted ketones. The major handicaps in developing direct regio- and enantioselective C - C bond forming reactions at $\mathrm{C}_{\alpha}$ position of $\alpha$-branched ketones under proton transfer conditions stem from: i) the relatively high $\mathrm{pK}_{\mathrm{a}}$ value of the ketone substrate and ii) the steric constraints imposed by the carbonyl $\alpha$-substituent, which difficult proton abstraction and decreases nucleophilicity. We envisioned that an alkenyl group installed at the $\alpha$-position of the carbonyl function, that is an $\alpha$-alkenyl cycloalkanone, would not only provide synthetic versatility to the resulting adducts, but, most importantly, also charge delocalization during enolization. As a result, a weak base catalyst might suffice to trigger the reaction while securing regioselective $\alpha$ - vs $\alpha^{\prime}$-enolization (Scheme 32).

Scheme 32.

[^56]However, in that design the Brønsted base should also be effective in controlling both the $\alpha$ - vs $\gamma$-reactivity of the transiently formed vinylogous enolate and the reaction stereoselectivity during generation of the quaternary stereogenic center.

Recently, I. Iriarte, O. Olaizola and Dr. Vera from this laboratory ${ }^{177}$ have addressed this latter problem in acyclic systems and found that conjugate additions of $\beta, \gamma$-unsaturated ketones to nitroalkenes catalyzed by bifunctional Brønsted bases provided only the $\alpha$-addition adducts (Scheme 33).

Scheme 33.

### 3.3.2. $\alpha$-Functionalization of $\alpha$-alkenyl cycloalkanones

On this basis, our study was initiated with the reaction of $\alpha$-alkenyl cycloalkanones with vinyl sulphones under similar conditions, addressing the double $\alpha / \alpha^{\prime} / \gamma$ regioselectivity problem. We elected to use vinyl sulphones as acceptors because, upon double bond hydrogenation and desulfonylation, products from a formal $\alpha$ alkylation of $\alpha$-alkyl cycloalkanones would result in a concise, simple way (Scheme 34). Such products are otherwise difficult to achieve. ${ }^{178}$

[^57]

Scheme 34.

### 3.3.2.1. Catalyst screening

Initially the reaction between 2-styrylcyclohexanone (34A) and 1,1bis(phenylsulfonyl)ethylene (35) was taken as a model to find the optimal catalyst for the $\alpha$-alkylation reaction of cyclic $\alpha$-alkenylketones (Table 10). In a first run, the reaction catalyzed by thiourea $\mathbf{C 9}$ afforded exclusively the desired $\alpha$-addition product 35A in good yield, but in an almost racemic manner. Urea catalysts C26 ${ }^{179}$ and C27 ${ }^{180}$ afforded the adduct in better, but still low enantioselectivity. On the other hand, (DHQD) ${ }_{2} \mathrm{PYR}(\mathbf{C 1 1})$ and squaramide catalysts $\mathbf{C} 7^{154 \mathrm{a}}$ and $\mathbf{C 1 2}{ }^{154 \mathrm{~b}}$ rendered the addition product in high yield and moderate ee values (60-73\% ee). When using the less basic amine $\mathbf{C 1 0}{ }^{156}$ as the catalyst low conversions were observed, even at room temperature. Moreover, the new squaramide catalysts bearing an amide group as an additional H bond donor functionality ( $\mathbf{C 1 3}$ and $\mathbf{C 2 8}{ }^{181}$ ) led to no improvement as compared to $\mathbf{C 7}$. However, using a more sterically demanding catalyst such as $\mathbf{C 2 9}{ }^{182}$ the desired adduct was obtained in excellent yield and enantioselectivity ( $96 \% e e$ ). Furthermore, catalyst C30, synthesised from hydrogenated quinine, afforded adduct 35A in even higher enantioselectivity ( $98 \% e e$ ). Remarkably, no formation of $\alpha^{\prime}$ - or $\gamma$-addition adducts was observed with any of the catalyst.

### 3.3.2.2. Reaction scope

Once the optimal catalyst for the reaction model was found, the reaction of cyclic $\alpha$-alkenyl ketones $\mathbf{3 4}$ with bisulfone $\mathbf{3 3}$ was conducted following the next standard procedure: the donor ketone was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ and 1.5 equivalents of 1,1-bis(phenylsulfonyl)ethylene (35) and $5 \mathrm{~mol} \%$ of the catalyst C30 were added. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$, and after verifying that the reaction finished (TLC monitoring, 14 h ), the reaction mixture was submitted to flash column chromatography on silica gel eluting with hexane/EtOAc mixtures.

As data in Table 11 show, the reaction tolerated well the different ring-sized cycloalkanones (34B-34D), affording the corresponding alkylation products 35B-35D in high yield and excellent enantioselectivity except for the cyclopentanone derivative $\mathbf{3 5 B}$, which was obtained in lower selectivity. It is noteworthy that in the case of adducts 35B and 35D switching the solvent to toluene resulted in an increase of stereoselectivity. Moreover, compound 35E, bearing substituents at the cyclohexanone ring and with a more electron-rich alkenylic group was also obtained with equally good results. However, product $\mathbf{3 5 F}$, not having a styril group, was obtained in lower ee values. Curiously, when $\alpha$-phenyl cyclohexanone (35G) was tested in the reaction for a comparison, no reaction was observed, probably due to the bigger steric hindrance present at the $\alpha$-position as compared to the other substrates. In addition, the scalability of the reaction was demonstrated by performing the reaction at 3 mmol scale, obtaining adduct 35A with similar results. Importantly, in every case exclusively the $\alpha$-addition product was formed.

In parallel to our work, O . Mugica from this laboratory found that vinyl sulphones are suitable acceptors for the conjugate addition reaction with $\alpha$-alkenyl $\alpha$ tetralones, and was able to obtain the addition products in high yield and almost perfect enantioselectivity by using "bulky" Brønsted base catalyst C30 (Scheme 35).

## Scheme 35.

### 3.3.2.3. Elaboration of adducts

Once an efficient and highly selective procedure for the $\alpha$-alkylation was obtained, some possibilities for the transformation of the adducts were briefly explored.

First, the desulfonylation of adducts $\mathbf{3 5 A}$ and $\mathbf{3 5 E}$ was performed with magnesium in methanol after ketalization of the carbonyl to avoid its nonstereoselective reduction (Scheme 36). The desired desulfonylated products 38 and 39 were obtained in moderate yield.

Scheme 36.

Moreover, alkylation of product 36 was performed with methyl iodide and sodium hydride obtaining the methylated product 40 in high yield, and upon subsequent desulfonylation and deprotection $\alpha, \alpha$-disubstituted ketone $\mathbf{4 1}$ was obtained in moderate yield (Scheme 37). Unfortunately, preliminary attempts on benzylation and allylation of 36 under the same reaction conditions were unsuccessful.

Scheme 37.

In another transformation, compound 38 was derivatized to afford known $\beta$ ketoester 43, ${ }^{183}$ which served to determine the configuration of adduct $\mathbf{3 8}$ and its precursor 35A as $R$ (Scheme 38). Configuration of remaining adducts was assumed based on a uniform reaction mechanism.

[^59]

## Scheme 38.

On the other hand, the branched cycloalkanone $\mathbf{4 5}$ was synthesised in high yield from 38 via hydrolysis of the ketal and reduction of the double bond with $\mathrm{H}_{2} / \mathrm{Pd}$ (Scheme 39). The former is the adduct formally derived from the asymmetric alkylation of an $\alpha$-alkyl cycloalkanone, which is difficult to achieve regio- and stereoselectivily.

Scheme 39.

Intermediate 44 was also used for the preparation of the $\beta, \gamma$-dihydroxy ketone derivative 42 (Scheme 40). In a first step ketone 44 was oxidized with osmium tetroxide and N -methylmorpholine N -oxide affording the hemiketal 46, and after conversion to the ketal the desired diol $\mathbf{4 2}$ was obtained in good yield and as a single isomer.

Scheme 40.

Additionally, a crystalline sample of adduct 46 was obtained by crystallization from a mixture of hexane/dichloromethane and thus the absolute configuration of compound 46 was established by a single crystal X-ray analysis. The configuration of
the molecule happened to be ( $1 S, 6 S, 7 S, 8 S$ ), with both hydroxyl groups on the same side of the tetrahydrofurane ring (Figure 8).

Figure 8.

Finally, compound 39 was reduced with $\mathrm{H}_{2} / \mathrm{Pd}$ leading to the $\alpha, \alpha$-dialkyl ketal intermediate 47, which after subsequent oxidative scission and deprotection of the ketone afforded product 48 (Scheme 41). It is worth noting that $\mathbf{4 8}$ is the adduct formally derived from the asymmetric Michael reaction between an $\alpha$-alkyl cycloalkanone and an enoate, a reaction for which no direct Brønsted base-catalyzed procedures have yet been reported.

Formal disconnection

## Scheme 41.

### 3.3.3. $\alpha$-Alkylation of $\boldsymbol{\beta}$-tetralone derivatives

Given these results, we next explored the behaviour of $\beta$-tetralones in this type of reations. We hypothesised that the fused aromatic ring in $\beta$-tetralones might induce preferential enolization at $\mathrm{C}_{\alpha}$ rather than $\mathrm{C}_{\alpha^{\prime}}$ (Scheme 42), and that in the presence of a Brønsted base relatively high concentrations of the enolic form would be expected, thus eventually driving the catalytic process forward. Moreover, not only alkenyl, but also alkyl groups at this position might be equally tolerated.

Scheme 42.

The only previous asymmetric procedures for the $\alpha$ '- and $\alpha$-functionalization of $\beta$-tetralone derivatives described by Seebach ${ }^{184}$ and d'Angelo ${ }^{185}$ respectively rely on the use of chiral amine auxiliaries, affording the corresponding adducts in good yield but variable diastereo- and enantioselectivity (Scheme 43). Most importantly, in these examples the regioselectivity of the reaction is strongly substrate-dependent.

Scheme 43.

In this context, the use of a chiral Brønsted base would not only enable the use of catalytic amounts of the chiral compound for the selective $\alpha$-functionalization of $\beta$ tetralones, but, compared to the previous procedures employing chiral amine auxiliaries,

[^60]would also avoid the need for additional steps for the formation of the nucleophilic species and the recovery of the final carbonyl compound.

Indeed, whilst O . Mugica from this laboratory demonstrated that $\beta$-tetralones can be selectively substituted at $\mathrm{C}_{\alpha}$ in the presence of a Brønsted base catalyst employing vinyl sulphones as electrophiles, ${ }^{186}$ we have found that nitroolefins and azodicarboxylates are also suitable substrate acceptors for this reaction leading to attractive building-blocks of products of relatively greater complexity, as it has been shown in previous works (Scheme 44). ${ }^{187}$

Stradiol

Cholestane

Scheme 44.

### 3.3.3.1. Initial experiments and reaction scope

Initially the reaction between $\beta$-tetralone 49B and nitrostyrene (32a) at $0^{\circ} \mathrm{C}$ was taken as a model in order to find the optimal Brønsted base catalyst to render the corresponding $\alpha, \alpha$-disubstituted $\beta$-tetralones. As the most representative experiments summarised in Table 12 show, all catalysts afforded the $\alpha$-addition adduct exclusively in a completely diastereoselective manner. However, stereoselectivity happened to be

[^61]highly catalyst-dependent. Catalysts bearing the squaramide H-bonding structure (C7, C12, C13, C28, C31-C33) exhibited a superior enantiocontrol when compared to catalysts with other functionalities such as urea $\left(\mathbf{C 2 6}{ }^{179}\right)$, thiourea $\left(\mathbf{C 9}{ }^{155}\right)$ and ureidopeptide ( $\mathbf{C 3 5}{ }^{188}$ ), or catalysts not bearing this kind of H -bond donor moieties (C11 and C34), which all rendered adduct 51Ba in low $e e(<50 \%)$. C7 ${ }^{154 \mathrm{a}}$ and C12 ${ }^{154 \mathrm{~b}}$ afforded the adduct in similar enantioselectivity, while catalysts C13 and C31 ${ }^{189}$ provided slightly higher ee. Catalysts bearing a benzylic group instead of an arylic group at the amide functionality ( $\mathbf{C 2 8}{ }^{181}$ and $\mathbf{C 3 2}$ ) rendered the product in improved enantioselectivity, although longer reaction times ( 16 h ) were required. Furthermore, the use of N -methylated catalyst (C33) leaded to a significant loss of enantioselectivity, thus suggesting that the amide group is involved in some H -bond interaction during the reaction.

Next, to ensure that stereoselectivity was not substrate-dependent catalysts with the squaramide motif ( $\mathbf{C 1 3}, \mathbf{C 2 8}, \mathbf{C} 32$ and $\mathbf{C 3 3}$ ) were tested in the reaction between $\beta$ tetralone 49B and the more electron-rich nitroalkene 32b (Table 13). The results were similar to the ones above obtained.

In light of the preliminary results, catalysts C13, C28 and C32 were chosen for the study of the effect of temperature in the reaction between $\beta$-tetralone 49B and nitrostyrene (32a) (Table 14). Lowering the temperature from 15 to $0{ }^{\circ} \mathrm{C}$ improved the enantioselectivity obtained with catalyst $\mathbf{C 1 3}$, although reaction times became longer (entry 1 vs. 2). Further decrease in temperature to $-20^{\circ} \mathrm{C}$ allowed to obtain adduct 51Ba in $90 \%$ ee (Table 14, entry 3). Conducting the reaction with catalyst $\mathbf{C 2 8}$ at $-10^{\circ} \mathrm{C}$ instead of $15{ }^{\circ} \mathrm{C}$ also improved the stereoselectivity (entry 4 vs. 5), and afforded comparable results to the ones obtained with catalysts $\mathbf{C 1 3}$ at $-20^{\circ} \mathrm{C}$ (entry 3 vs. 5). An improvement in enantioselectivity was also observed with catalyst $\mathbf{C 3 2}$ when using it at $0^{\circ} \mathrm{C}$ as compared to the same reaction at $15{ }^{\circ} \mathrm{C}$ (entry 6 vs. 7 ). However, the low solubility of catalyst C32 made it behave sluggishly when decreasing the temperature bellow $0^{\circ} \mathrm{C}$, affording the product in similar yield and enantioselectivity, but after longer reaction times ( 72 h ) (Table 14, entry 8). Thus, $\mathbf{C 2 8}$ was chosen as the optimal catalyst for the reaction of $\alpha$-substituted $\beta$-tetralones with nitroalkenes (32).

Table 14. Study of the effect of temperature in the reaction between 49B and 32a ${ }^{[a]}$

[a] Reactions conducted on a 0.30 mmol scale in 0.6 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(49 \mathrm{~B} / 32 \mathrm{a} /$ cat molar ratio $=$ 1:1.2:0.1). $d r=>20: 1$ in all cases. [b] Yield after chromatography. [c] ee of major isomer, determined by chiral HPLC. [d] Low solubility of the catalyst.

With the optimized conditions in hand, the reaction of $\beta$-tetralone derivatives 49B-49D with a set of nitroalkenes (32) was carried out following the next standard procedure: the donor was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ and 1.2 equivalents of the acceptor nitroalkene and $10 \mathrm{~mol} \%$ of the catalyst $\mathbf{C 2 8}$ were added. The reaction mixture was stirred at $-10^{\circ} \mathrm{C}$, and after verifying that the reaction finished (TLC monitoring, $16-64 \mathrm{~h}$ ) the reaction mixture was submitted to flash column chromatography on silica gel eluting with hexane/EtOAc mixtures.

As the results in Table 15 show, the reaction proceeds smoothly for the differently substituted aromatic nitroalkenes (32a-32d) affording the corresponding adducts (51Ba-51Bd) in high selectivity ( $90-92 \%$ ee). Furthermore, heteroaromatic ( $\mathbf{3 2 h}$ ) and aliphatic ( $\mathbf{3 2 i}$ ) nitroalkenes afforded the corresponding adducts ( $\mathbf{5 1 B h}$ and 51Bi) with similarly good yield and enantioselectivity. $\alpha$-Subsituted tetralones bearing additional functionality (49C and 49D) were also successfully employed in the reaction with equally good yields and $e e$ values (products 51Ce and 51Df). The reaction also tolerates $\beta$-tetralones bearing electron donating or withdrawing groups at the aromatic ring, which were equally efficient (adducts $\mathbf{5 1 F g}, \mathbf{5 1 G a}$ and $\mathbf{5 1 H j}$ ). Importantly, in every case no traces of products from the reaction at the $\alpha^{\prime}$-carbon atom were found, and the adducts were obtained essentially as a sole diastereomer. It must be noted that for the formation of some adducts ( $\mathbf{5 1} \mathrm{Ce}, 51 \mathrm{Fg}$ and $\mathbf{5 1 G a}$ ) in high yield the use of the more active catalyst C13 was necessary.

Table 15. Michael reaction scope between $\alpha$-substituted $\beta$-tetralones and nitroalkenes ${ }^{[a]}$

51Ce, $80 \%$ yield, $99 \% e e^{[c]}$

51Df 78\% yield, 91\% ee

[a] Reactions conducted on a 0.30 mmol scale in 0.6 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{4 9} / \mathbf{3 2} / \mathbf{C 2 8}$ molar ratio $=$ 1:1.2:0.1). Yield of isolated product after chromatography. $d r=>20: 1$ in all cases. ee determined by chiral HPLC. [b] Reaction conducted at $-20^{\circ} \mathrm{C}$. [c] Reaction conducted at $-20^{\circ} \mathrm{C}$ with catalyst C13. [d] Reaction conducted at RT with catalyst C13.

In light of the good results obtained with $\alpha$-substituted $\beta$-tetralones, the behaviour of the parent $\alpha$-unsusbstituted $\beta$-tetralone 49A was investigated under similar reaction conditions. A selection of bifunctional Brønsted base catalysts bearing the squaramide functional unit (C7, C13 and C28) were tested in the reaction of 49A with nitrostyrene (32a) (Table 16). In all the cases the desired adduct 51Aa with a tertiary stereocenter at $\mathrm{C}_{\alpha}$ was obtained in high yield, good diastereoselectivity and almost
perfect enantioselectivity. Importantly, no $\alpha, \alpha$-double addition or $\alpha$ '-addition adducts were observed in any of the cases.

Table 16. Catalyst screening for the reaction between $\mathbf{3 5 A}$ and $\mathbf{3 4} \mathbf{a}^{[a]}$

[a] Reactions conducted on a 0.30 mmol scale in 0.6 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{4 9} \mathbf{A} / \mathbf{3 2 a} / \mathrm{cat}$ molar ratio $=$ 1:1.2: 0.1 ). Yield of isolated product after chromatography. $d r$ determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy. ee determined by chiral HPLC.

Next, the effect of temperature and the $\mathbf{C} 7$ loading in the reaction of 49A with nitrostyrene (32a) were examined (Table 17). Almost perfect enantioselectivity was obtained at $0,-20$ and $-40^{\circ} \mathrm{C}$ (Table 17, entries 1,2 and 4, respectively), but higher temperatures (Table 17, entry 1) and prolonged reaction times (Table 17, entries 3 and 4) were detrimental for the diastereomeric ratio, likely due to the tendency of the adduct to further deprotonate in the presence of the catalyst, resulting in epimerization. Furthermore, reactions with 5, 2 and $1 \mathrm{~mol} \%$ C7 loadings afforded adduct 51Aa in equally good results (entries 5, 6 and 7, respectively).

Table 17. Study of the effect of temperature in the reaction between 49A and 32a catalyzed by $\mathbf{C 7}^{[a]}$

| Entry | $\mathbf{C} 7(\mathrm{~mol} \%)$ | $\mathrm{T}\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{t}(\mathrm{h})$ | ${\text { Yield }(\%)^{[\mathrm{b}]}}^{c}$ | $d r(\%)^{[\mathrm{c}]}$ | $e e(\%)^{[\mathrm{d}]}$ |

[a] Reactions conducted on a 0.30 mmol scale in 0.6 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(49 \mathrm{~A} / 32 \mathrm{a}$ molar ratio $=1: 1.2)$. $[\mathrm{b}]$ Combined yield of isomers after chromatography. [c] Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy of an untreated reaction sample and confirmed by HPLC. [d] ee determined by chiral HPLC, same for both isomers.

The diastereomeric ratio was determined by ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz})$ analysis of the reaction crude (Figure 9) comparing the peak areas of the protons at $\mathrm{C}_{\alpha}$ of adduct 51Aa ( 3.76 ppm for minor and 3.65 ppm for major).

Figure 9.

Once the optimized conditions were found, the reaction of $\beta$-tetralone 49A with nitroalkenes (32) was carried out following the next standard procedure: the donor was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ and 1.2 equivalents of the acceptor nitroalkene and $2 \mathrm{~mol} \%$ of the catalyst $\mathbf{C} 7$ were added. The reaction mixture was stirred at $-20^{\circ} \mathrm{C}$ for the aromatic nitroalkenes, and at room temperature for the aliphatic ones. After verifying that the reaction finished (TLC monitoring, 8-24 h) the reaction mixture was submitted to flash column chromatography, isolating the corresponding adduct $\mathbf{5 1 A}$ as a mixture of diastereomers.

As results in Table 18 show, the reaction was again found to be completely regioselective for all the nitroalkenes tested. Furthermore, the corresponding Michael addition products $\mathbf{5 1 A}$ were obtained from both aryl- (51Aa-51Ae) and alky-substituted ( $\mathbf{5 1} \mathbf{A i}-\mathbf{5 1 A j}$ ) nitroalkenes in high yield and in excellent enantioselectivity. Furthermore, diastereoselectivity was good (4:1 or higher) with the only exception of the 2 -furyl substituted nitroalkene 32h, which afforded a 1:1 diastereomeric mixture (entry 6). The reaction was also scaled up to a 2 mmol scale for adduct 51Aa obtaining equally good results (entry 10 ).

Control experiments were carried out to study the tendency of adducts 51A towards epimerization. Thus, when compound 51Aa ( $d r=4: 1$ ) was exposed to $5 \mathrm{~mol} \%$ of C7 at room temperature in dichloromethane for 3 h an equimolar mixture of diastereomers was obtained, as could be monitored by HPLC (Scheme 45). However, in the absence of $\mathbf{C} 7$, no epimerization was observed, even after 24 h at $80^{\circ} \mathrm{C}$.

Scheme 45.

Later, the suitability of this method for the site- and stereoselective $\alpha$ functionalization of related ketone substrates was investigated. Indeed, the aromatic ring-fused cycloalkanone $\mathbf{5 3}$ with an oxygen heteroatom in the cycle was equally competent undergoing the regioselective Michael addition under described catalytic conditions (Scheme 46). The desired adduct $\mathbf{5 4}$ was obtained in high yield and excellent enantioselectivity as a $1: 1$ diastereomeric mixture. The diastereoselective formation of the product 54 was observed when lowering the reaction temperature to $-60^{\circ} \mathrm{C}$, but upon flash column chromatography on silica gel the 1:1 mixture was again obtained.

Scheme 46.

Cycloalkanone 55, with a 7-membered ring, was also found suitable for the reaction although it needed to be conducted at room temperature and with a $10 \mathrm{~mol} \%$ catalyst loading (Scheme 47). The corresponding adducts were obtained in good yield, good diastereoselectivity (4:1 or higher) and excellent enantioselectivity. Again, no double addition nor $\alpha^{\prime}$-addition products were observed.

## Scheme 47.

### 3.3.3.2. Elaboration of adducts

Once an efficient and highly regio- and stereoselective procedure for the Michael addition of $\beta$-tetralones to nitroalkenes was obtained, some possibilities for the transformation of the adducts into more complex polycyclic structures were explored.

First, adducts 51Aa and 51Ae were reacted with nitroalkenes 32a and 32i, respectively, in the presence of $10 \mathrm{~mol} \% \mathbf{C 7}$, as shown in Scheme 48. As a result, the tricyclic systems 57/57, and 58/58' were obtained in moderate combined yield. Remarkably, with this procedure only two out of the possible 64 stereoisomers are obtained. Furthermore, no cyclization product derived from the minor isomer of 51A was observed in neither of the cases, and the isomeric composition of the isolated product was found to be independent of the initial mixture of 51A. These results suggest that formation of the tricycles through a Michael/Henry cascade reaction involves some kinetic resolution process.

Scheme 48.

When 51Ae was treated with acrolein in the presence of $\mathbf{C 7}$ at room temperature, the Michael addition product 59 was isolated. Then, the aldol-reactionmediated cyclization to $\mathbf{6 0}$ was achieved employing $10 \mathrm{~mol} \%$ pyrrolidine. Otherwise, direct transformation of $\mathbf{5 1 A e}$ to the spirocyclic aldol $\mathbf{6 0}$ could also be achieved by treatment with acrolein in the presence of $10 \mathrm{~mol} \%$ pyrrolidine. Both ways $\mathbf{6 0}$ was produced as essentially a single diastereomer. It should be noted that the course of the reaction is quite unexpected, taking into account that cycloalkanones under similar reaction conditions have been reported to afford substituted decalins instead. ${ }^{190}$

## Scheme 49.

[^63]Moreover, the reduction of adducts $\mathbf{5 1}$ afforded in very good yield hexahydrobenzo $e$ ] indoles, heterocyclic cores present in many biologically active compounds (Scheme 50). ${ }^{191}$ For instance, reduction of the adduct $\mathbf{5 1 A e}$ with $\mathrm{H}_{2} / \mathrm{Pd}$ provided amine 61 in a highly selective manner. On the other hand, adduct 51Ba was also reduced with either $\mathrm{Zn} / \mathrm{H}^{+}$or $\mathrm{H}_{2} / \mathrm{Pd}$, providing imine 62 and imine $N$-oxide 63 , respectively.

## Scheme 50.

### 3.3.3.3. Determination of the absolute configuration

The absolute configuration of compounds 57, 60 and $\mathbf{6 3}$ was established by a single crystal X-ray analysis and for the remaining compounds derived from $\beta$ tetralones and related cyclic ketones was assumed based on a uniform reaction mechanism. The ORTEP diagrams of the molecules are shown in Figure 10.

[^64]

$57(1 R, 2 S, 3 R, 4 R, 5 S, 6 S)$

60 (10S, 11R, 12R, 15R)

Figure 10.

Knowing the configuration of the $\mathrm{C}_{\beta}$, the absolute configuration of $\mathbf{6 1}$ was established by a NOESY analysis of its amide derivative 64 (Scheme 51). Irradiation at
$3.80 \mathrm{ppm}\left(\mathrm{H}^{2}\right)$ (Figure 11) revealed the proximity of $\mathrm{H}^{1}$ (NOESY $>2 \%$ ), indicating that both protons are on the same side of the pyrrolidine ring. On the other hand, only a small signal from $\mathrm{H}^{3}$ was detected ( $<0.5 \%$ ), thus indicating that $\mathrm{H}^{2}$ and $\mathrm{H}^{3}$ are on opposite sides of the pyrrolidine ring. Therefore, the configuration of the molecule was assigned as $(1 R, 2 S, 3 S)$.

## Scheme 51.

Figure 11.

On the other hand, the configuration of 57 , was established by a NOESY analysis, and for product 58' was assumed based on a uniform reaction mechanism. Irradiation at $3.82 \mathrm{ppm}\left(\mathrm{H}^{5}\right)$ (Figure 12) revealed the proximity of $\mathrm{H}^{3}$ and $\mathrm{H}^{4}$ (NOESY $>1.5 \%$ ), indicating that both protons are on the same side of the ring. On the other hand, $\mathrm{H}^{1}, \mathrm{H}^{2}$ and $\mathrm{H}^{6}$, gave almost no signal ( $<0.30 \%$ ), thus suggesting that these protons are
on the other side. Therefore, the configuration of the molecule was deduced to be ( $1 S$, $2 S, 3 R, 4 R, 5 S, 6 S)$.

Figure 12.

### 3.3.4. $\alpha$-Amination of $\boldsymbol{\beta}$-tetralone derivatives

Given these results, we decided to further extend the regioselective functionalizaiton of $\beta$-tetralones. Thus, we explored the behaviour of $\beta$-tetralones in the amination reaction using azodicarboxylates as acceptors under similar reaction conditions.

### 3.3.4.1. Catalyst screening

Initially the reaction between $\beta$-tetralone 49B and di-tert-butyl azodicarboxylate (50) was taken as a model to find the optimum Brønsted base catalyst for the reaction to afford $\alpha$-amino $\beta$-tetralones in a stereoselective manner (Table 19). We began by comparing catalysts C7, C9 and C26 in order to determine the most suited $H$-bond donor group for the reaction. In a first run, reaction with squaramide catalyst $\mathbf{C} 7^{154 a}$ afforded the desired adduct 52B in complete regioselectivity and good yield, but low stereoselectivity. Unexpectedly, using the parent thiourea $\mathbf{C} \mathbf{9}^{155}$ no addition product was
observed even after 24 h . The use of urea $\mathbf{C 2 6}{ }^{179}$ in the reaction allowed to shorten the reaction times, but low enantioselectivity was obtained. On the other hand, when ureidopeptide $\mathbf{C 2 7}{ }^{180}$ was employed the reaction finished in only 10 h and in excellent stereoselectivity. Finally, no reaction was observed when quinine (C34) was used as the catalyst.

Table 19. Catalyst screening for the reaction between 49B and 50 ${ }^{[a]}$

[a] Reactions conducted on a 0.30 mmol scale in 0.6 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathbf{4 9 B} / \mathbf{5 0} / \mathrm{cat}$ molar ratio $=1: 2: 0.05)$. Yield of isolated product after chromatography. ee determined by chiral HPLC.

### 3.3.4.2. Reaction scope

The study of the generality of the method was addressed by carrying out the reaction of $\beta$-tetralones 49B-49E and related ketone substrates 65 and 66 with 50. As standard reaction conditions, the ketone was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ and 2.0 equivalents of $\mathbf{5 0}$ and $5 \mathrm{~mol} \%$ of the catalyst $\mathbf{C 2 7}$ were added. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$, and after verifying that the reaction finished (TLC monitoring, 10 h ), the
mixture was submitted to flash column chromatography on silica gel eluting with hexane/EtOAc mixtures.

As the results in Table 20 show, the reaction proceeded in good yield and excellent enantioselectivity with a variety of $\alpha$-substituted $\beta$-tetralones (adducts 52B52E). Furthermore, the aromatic ring-fused cycloalkanone 67 with an oxygen heteroatom in the cycle was equally competent undergoing the amination reaction, although lower temperatures were needed in order to obtain good stereocontrol due to the higher reactivity of the nucleophile as compared to $\beta$-tetralones. On the other hand, reaction with the 7 -membered ring cycloalkanone $\mathbf{6 6}$ did not happen, even after 24 h at room temperature. Importantly, no addition at the $\alpha$ '-carbon was observed in any of the cases.

Table 20. $\alpha$-Amination reaction of $\beta$-tetralones and related ketone substrates ${ }^{[a]}$

[a] Reactions conducted on a 0.15 mmol scale in 0.3 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (donor $/ \mathbf{5 0}$ / $\mathbf{C} 27$ molar ratio $=1: 2: 0.05$ ). Yield of isolated product after chromatography. ee determined by chiral HPLC. [b] Reaction conducted at $-60^{\circ} \mathrm{C}$.

### 3.4.Conclusions

In summary, the highly stereoselective generation of tetrasubstituted carbon stereocenters at $\mathrm{C}_{\alpha}$ of several enolizable carbonyl compounds has been realized via bifunctional Brønsted base-catalyzed Michael reaction.

On the one hand the addition of oxazolones with differently substituted $\alpha$ '-oxy enones as key enoate surrogates has been preformed and it was demonstrated that the resulting $\alpha$ '-oxy ketone adducts can be smoothly converted into the corresponding carboxylic acid through simple oxidative cleavage of the ketol unit.

In addition, a set of novel catalysts were developed for the 1,6 -addition reaction of oxazolones and cyanoacetates to $\alpha$ '-oxy dienones, obtaining the desired adducts in good yield and virtually perfect regioselectivity using chiral guanidines as catalysts. Unfortunately, low enantioselectivity was obtained in all cases.

On the other hand, the asymmetric Brønsted base-catalyzed regio-, diastereoand enantioselective functionalization of cyclic unactivated ketones (not bearing a strongly EWG at $\alpha$-carbon) has been studied. In this context, the $\alpha$-functionalization of cyclic $\alpha$-alkenyl ketones was achieved in a highly diastereo- and enantioselective manner and with complete regioselectivity, leading to the formation of quaternary carbon stereocenters at $\mathrm{C}_{\alpha}$. Furthermore, some possibilities for the transformation of these adducts were explored.

Moreover, the method was successfully extended to the $\alpha$-functionalization of $\beta$ tetralone derivatives. Once again the reaction proceeded with complete regioselectivity, obtaining exclusively the $\alpha$-substitution adducts in high diastereo- and enantioselectivity, and leading to the formation of either a tri- or tetrasubstituted stereogenic carbon atom. In addition, the synthetic utility of the method was demonstrated by easy transformation of adducts into diverse polycyclic compounds featuring up to six contiguous stereogenic centers.

## Synthesis of arogenate by dearomatising cyclisation of a Ltyrosine derivative

### 4.1.Arogenate: Origin, structure and interest

Arogenate $\left[\mathrm{L}-(8 S)-\beta\right.$-(carboxy-4-hydroxy-2,5-cyclohexadien-1-yl)alanine] ${ }^{2-}$ is a precursor in the biosynthesis of aromatic amino acids (AAA) in some microorganisms ${ }^{192}$ and plants. ${ }^{193}$ Although it is an immediate precursor of Lphenylalanine and L-tyrosine in the shikimate pathway, organisms can alternatively obtain these amino acids through the phenylpyruvate route, as shown in Scheme 1. ${ }^{194}$

Unlike in plants, pathways for the synthesis of AAA are inexistent in animals, and therefore enzymes involved in their biosynthesis are usual targets for the development of safe herbicides. Indeed, depending on the exact plant species, either one or both arogenate and phenylpyruvate routes are used to produce AAA, and thus this metabolic diversity might provide a source for discriminative herbicides through the selective inhibition of one of the pathways. In this context, herbicides structurally related to arogenate could inhibit either arogenate dehydrogenase (ADH) or arogenate dehydratase (ADT) (Scheme 1).

[^65]

## Scheme 1.

Arogenate presents a chirality axis located in the future aromatic ring in addition to the stereocenter at $\mathrm{C}_{\alpha}$ of natural $\alpha$-amino acids, making it a small but rather complex molecule. Furthermore, the free acid (arogenic acid; see Scheme 1) is highly unstable and it is quantitatively transformed into L-phenylalanine, ${ }^{195}$ and arogenate salts are stable at pH 7.5 in the solid state, but decompose when exposed to heat or to a strong base. ${ }^{196}$
${ }^{195}$ L. O. Zamir, R. A. Jensen, B. H. Arison, A. W. Douglas, G. Albers-Schönberg, J. R. Bowen, J. Am. Chem. Soc. 1980, 102, 4499-4504.
${ }^{196}$ M. J. Crossley, R. C. Reid, J. Chem. Soc., Chem. Commun. 1994, 2237-2238.

### 4.2.Previous approaches towards the synthesis of arogenate

In light of the precarious stability of arogenate along with its difficult isolation from natural sources, ${ }^{195}$ a total synthesis seems to be a more appropriate alternative for the obtainment of arogenate and its structural analogues. Surprisingly, however, arogenate has received little synthetic attention, with only two published syntheses.

In 1981 Danishefsky and coworkers ${ }^{197}$ described the first total synthesis of arogenate starting from a glutamic acid derivative in 8 steps, via a key Diels-Alder reaction (Scheme 2). However, the yield of the final step was not reported.

Scheme 2.

On the other hand, Crossley and Reid ${ }^{196}$ performed its synthesis in 7 steps in an overall $2.8 \%$ yield from methyl 2,5-diene-1-carboxylate through a key Michael addition and resolution (Scheme 3).

[^66]

Scheme 3.

In both approaches, the diastereoselective reduction of a cyclohexadienone spyrolactam intermediate is the key step for the formation of the chirality axis of the cyclohexadiene ring present in arogenate, and in both cases a mixture of diastereomers is formed.

Surprisingly, neither of these syntheses employ the obvious starting material to arogenate: tyrosine itself.

### 4.3.Group precedents and objectives

Previous work in the Clayden group in the context of another project involving a development of Seebach's self-regeneration of stereocenters ${ }^{198}$ explored the coupling of tyrosine-derived carbamoyl chloride $\mathbf{7 1}$ with $N$-methylaniline to form the corresponding urea. However, the alternative spirocyclic imidazolidinone 72 was obtained in high yield instead (Scheme 4). The intramolecular nucleophilic dearomatizing spirocyclisation reaction seemingly proceeds through the formation of a carbamoyl iodide intermediate, as low yield was obtained in the absence of the iodine salt. The spirocyclisation of the diastereomeric isomer of $\mathbf{7 1}$ was also attempted but no reaction was observed, most probably because the steric hindrance of the tert-butyl group avoided the approach of the phenol ring to the carbamoyl group.

Scheme 4.

Compound 72 is structurally closely related to the spirocyclic lactam intermediates described in the previously reported synthetic methods (see Scheme 2 and Scheme 3), and therefore it was thought that the dearomatising spirocyclisation reaction may open a pathway for the synthesis of arogenate and related compounds from the natural amino acid L-tyrosine, inverting the biological path for AAA metabolism (Scheme 5).

[^67]

## Scheme 5.

The Luche reduction of compound $\mathbf{7 2}$ was performed before this stay, affording a 3:1 diastereomeric mixture of alcohol 73 in moderate yield (Scheme 6). Unfortunately, attempts to hydrolyse the three $\mathrm{C}-\mathrm{N}$ bonds in the product under acid conditions without compromising the integrity of the fragile cyclohexadienone to afford arogenate were unsuccessful.

Scheme 6.

In light of this result, alternative synthetic pathways were proposed involving alternative heterocyclic structures, namely oxazolidinone and hydantoin, that may make feasible the use of milder hydrolysis conditions leading to arogenate (Figure 1).

oxazolidinone

Figure 1.

A preparatory work on the formation of the oxazolidinone structure from Ltyrosine was carried out in the Clayden group by L. Eagling (Scheme 7). O-tert-Butyl-L-tyrosine was condensed with benzaldehyde forming the imine, which upon reaction with benzoyl chloride afforded the $N$-benzoyl substituted oxazolidinone in low yield.

Scheme 7.

On the other hand, in a preliminary work with the hydantoin structure, L. Eagling achieved the synthesis of hydantoin 75, which possessed the carbamoyl chloride moiety, from L-tyrosine methyl ester (Scheme 8). $O$-TBS L-tyrosine methyl ester was reacted with tert-butyl isocyanate to form the corresponding urea, and it was then treated with potassium tert-butoxyde to form hydantoin 74 in moderate yield. Finally, reaction with triphosgene afforded the $N$-substituted hydantoin 75 in low yield.

## Scheme 8.

At the outset of this doctoral stay, the development of a reproducible method for the synthesis of modifiable spirocyclic compounds that could subsequently be reduced and hydrolysed leading to arogenate was a priority, as it was essential for the posterior preparation of arogenate-based potential herbicides (Figure 2).

Figure 2.

With this aim, the series of possible synthetic routes described below were proposed.

### 4.4.Synthetic plan

The synthesis of arogenate through oxazolidinone intermediates was taken as the first alternative, following the preliminary work carried out in the Clayden group (see Scheme 7). However, at the outset two main challenges of this synthetic route were patent: i) the formation and isolation of an $N$-carbamoyl oxazolidinone (Scheme 9, step 1); and ii) the yet unrealised dearomatising spirocyclisation of this oxazolidinone intermediate (Scheme 9, step 2).

Scheme 9.

On the other hand, further exploration on the hydrolysis of spirocyclic imidazolidinone $\mathbf{7 3}$ was taken as a second option, this time under basic conditions given the low stability of arogenate at low pH (Scheme 10).

Scheme 10.

In addition, the importance of the cyclic imidazolidinone structure for the stabilization of the carbamoyl moiety and the spirocyclisation reaction was also investigated by comparison with the parent acyclic ester and amide (Figure 3).

Figure 3.

Finally, the suitability of the hydantoin structure for the spirocyclisation reaction was addressed. The main challenge here was finding a suitable protecting group for the phenol functionality that would ideally be automatically cleaved during the spirocyclisation step, or alternatively in a previous step without affecting the integrity of the carbamoyl chloride moiety (Scheme 11).

Scheme 11.

### 4.5.Results and discussion

### 4.5.1. Oxazolidinone route

In a first try, $O$-unprotected L-tyrosine was tested following the preliminary experiments on the oxazolidinone route in an attempt to avoid an additional deprotection step prior to the spirocyclisation. With that aim, l-tyrosine was condensed with benzaldehyde affording imine 76 in excellent yield. Unfortunately, when imine 76 was submitted to the reaction conditions previously used for the preparation of oxazolidinones, a complex mixture of unknown compounds was obtained (Scheme 12). In a first instance it was assumed to be due to the participation of the unprotected phenol group in the reaction.

Scheme 12.

Next, imine 77 was prepared in good yield from the commercially available $O$ methyl L-tyrosine for its reaction with a number of active carbonyl compounds to afford the corresponding $N$-carbonyl oxazolidinones (Scheme 13). In a first run, the imine was reacted with phosgene, but instead of the expected $N$-carbamoyl chloride substituted oxazolidinone, NCA ( $N$-carboxyanhydride) $\mathbf{7 8}$ was isolated as the major product in low yield. In a second run, 4-nitrophenyl chloroformate was used instead of phosgene, but a complex product mixture was obtained, and no formation of the desired oxazolidinone product was observed. At this point, the reaction was repeated with benzoyl chloride in order to ensure the reproducibility of the reaction performed in the preliminary work (see Scheme 7), affording the oxazolidinone 79 in good yield. On the other hand, when 1,1'-carbonyldiimidazole (DCI) was used instead of a an acyl chloride, no reaction was observed, even after 24 h at room temperature. Finally, in the reaction with $N, N^{\prime}$ disuccinimidyl carbonate (DSC), the unstable compound $\mathbf{8 0}$ was isolated as the major product in low yield. This result suggested that the reaction was not proceeding as expected because in most cases the addition to the electrophile occurred through the oxygen atom at the carboxylic salt instead of the nitrogen of the imine, therefore rendering impossible the formation of the oxazolidinone.

Scheme 13.

In light of these results, the oxazolidinone route was discarded as a viable option for the synthesis of arogenate.

### 4.5.2. Imidazolidinone route

As stated in the group precedents of section 4.3, the spirocyclisation reaction using imidazolidinone $\mathbf{7 1}$ had previously been performed in the Clayden group and only the final hydrolysis step was lacking. Therefore, polycyclic compound $\mathbf{7 3}$ was synthesised following the previously established procedure from a small amount of $O$ benzyl imidazolidinone $\mathbf{8 1}$ provided by L. Eagling (Scheme 14). Deprotection of $\mathbf{8 1}$ with $\mathrm{H}_{2} / \mathrm{Pd}$ in THF afforded the desired unprotected alcohol 71 without observing reduction of the acyl choride, and it was subsequently cyclised to afford dienone $\mathbf{7 2}$ in high yield. The posterior Luche reduction afforded the corresponding alcohol as a 3:1 mixture of diastereomers 73:73' in good overall yield.

## Scheme 14.

The major isomer 73 was then submitted to hydrolysis. In order to avoid acid reaction conditions, which would compromise the integrity of arogenate, a set of basic hydrolysis conditions were tested for the cleavage of the $\mathrm{C}-\mathrm{N}$ bonds (Scheme 15). In a first attempt, hydrolysis with sodium hydroxide and sodium carbonate in ethanol at 70 ${ }^{\circ} \mathrm{C}$ afforded a complex product mixture, in which no traces of arogenate were found by ${ }^{1} \mathrm{H}$ NMR. In a second run, reaction with triton B (benzyltrimethylammonium hydroxide) and sodium hydroxide in a water and THF mixture afforded similar results. Triethylamine was also tested as a base for hydrolysis, but no reaction occurred. Similarly, no change was observed in the reaction mixture when $\mathbf{7 3}$ was treated with lithium hydroxide or sodium hydroxide at room temperature. The treatment with sodium methoxide in methanol did not lead to any transformation either. On the other hand, when oxazolidinone $\mathbf{7 3}$ was treated with barium hydroxide in a dioxane / water mixture at $90^{\circ} \mathrm{C}$, peaks matching the ones expected for arogenate were observed by ${ }^{1} \mathrm{H}$ NMR.

## Scheme 15.

An initial attempt for the purification of arogenate was performed employing Sephadex A-25 ion exchange resin (chlorine form), but no separation of the reaction products was achieved. In a second trial arogenate (70) was purified by reverse phase column chromatography eluting with TFA / MeCN mixtures, obtaining traces of the desired compound. The chemical shifts observed in the ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) spectra (Figure 4) were consistent with the data found in the literature, ${ }^{199}$ thus confirming the formation of arogenate (70) and the configuration of intermediate 73.

[^68]

Figure 4.

Interestingly, a posterior thorough study by L. Eagling in the Clayden group revealed that spiro-arogenate ( $\mathbf{6 9}$ ), ${ }^{200}$ which is the product from the penultimate step in Danishefsky's synthesis of arogenate (see Scheme 2 in page 151), was the main product of this reaction, therefore further supporting the validity of this route for the synthesis of arogenate (Scheme 16).

Scheme 16. Last setp of Danishefsky's synthesis of arogenate

The study of the imidazoline route is still ongoing in the Clayden group.

[^69]
### 4.5.3. Acyclic route

As no investigation on the use of acyclic molecules for the spirocyclisation reaction had been performed, we set out to synthesise the ester and amide analogues of imidazolidinone 71 to determine whether the cyclic structure offered any real advantages for the synthesis of arogenate (Figure 5).

Figure 5.

We started by attempting to prepare the ester (Scheme 17), and in a first step the commercially available $O$-benzyl-L-tyrosine methyl ester was submitted to reductive amination with trimethylacetaldehyde, affording amine $\mathbf{8 2}$ in moderate yield. However, when the insertion of the N -carbamoyl chloride functionality was attempted employing the reaction conditions previously used for imidazolidinone 71, NCA 83 was obtained instead of the desired acyclic ester.

## Scheme 17.

Next, the preparation of the amide was addressed. The readily available Boc-O-benzyl-L-tyrosine hydroxysuccinimide ester was reacted with dimethylamine affording amide 84, and subsequently decarboxylated affording the unprotected amine $\mathbf{8 5}$ quantitatively. The reductive amination with trimethylacetaldehyde afforded compound

86 in moderate yield, which was submitted to the same $N$-funtionalization conditions used for imidazolidinone 71. Unfortunately, although untreated ${ }^{1} \mathrm{H}$ NMR aliquots of the reaction looked promising, only NCA $\mathbf{8 3}$ was isolated upon purification by silica gel column chromatography.

## Scheme 18.

In light of these results, we could conclude that the rigidity of the cyclic structure of imidazolidinone provides the essential stability that mantains the carbamoyl chloride functionality intact under isolation or mild reaction conditions.

### 4.5.4. Hydantoin route

As stated in the group precedents of Section 0, hydantoin $\mathbf{7 5}$ had previously been synthesised in the Clayden group. Therefore, it was prepared following the previously established procedure from a small amount of $O$-TBS hydantoin 74 provided by L . Eagling in moderate yield. The dearomatising cyclisation reaction was then attempted with the $O$-TBS protected compound 75, but no reaction occurred, as shown in Scheme 19.

## Scheme 19.

In consequence, the desilylation of $\mathbf{7 5}$ was addressed, as it was expected that the free alcohol would be able to undergo the intramolecular spirocyclisation reaction. Unfortunately, the carbamoyl moiety exhibited a higher reactivity than the TBS group, and therefore the selective deprotection of the alcohol could not be performed (Scheme 20). Indeed, when $\mathbf{7 5}$ was treated with TBAF (tetrabutylammonium fluoride), the $N$ unsubstituted hydantoin 87 was obtained in moderate yield. In a second run, HCl in $\mathrm{Et}_{2} \mathrm{O}$ was employed, but no reaction was observed. On the other hand, when HCl in MeOH was used, the product resulting from the nucleophilic addition of methanol to the carbamoyl group (88) was obtained. Despite having a worse leaving group than its precursor, as the phenol group was now unprotected, the spirocyclisation of compound $\mathbf{8 8}$ was attempted in toluene at $100^{\circ} \mathrm{C}$, but no reaction was observed even after 24 h .

Scheme 20.

In order to allow the deprotection of the phenol group without compromising the integrity of the carbamoyl moiety, the use of an $O$-benzyl substituted intermediate was besought based on the previous work with imidazolidinones (see Scheme 14). Thus, compound 91 was synthesised in three steps starting from the commercially available
$O$-benzyl-L-tyrosine methyl ester (Scheme 21). First, urea 89 was formed reacting the starting amine hydrochloride with tert-butyl isocyanate, and it was then reacted with potassium tert-butoxyde to form hydantoin 90 in moderate yield. Reaction with triphosgene afforded the $N$-substituted hydantoin 91 in low yield. As expected, the deportection of the alcohol with $\mathrm{H}_{2} / \mathrm{Pd}$ in THF proceeded smoothly affording hydantoin 92 as the major product in moderate yield.

Scheme 21.

The dearomatising cyclisation of $\mathbf{9 2}$ was not attempted within the stay in the Clayden group.

### 4.6.Conclusions

In summary, oxazolidinones, imidazolidinones and hydantoins have been studied as intermediates for the synthesis of arogenate via an intramolecular dearomatising cyclisation reaction starting from the natural amino acid l-tyrosine. During the investigation, it was shown that the oxazolidinone route was not suitable for the formation of the necessary $N$-carbonyl substituted intermediates, and important advances were made in the hydantoin route. Furthermore, the importance of the cyclic structure of intermediates for the stabilization of the carbamoyl chloride functionality was demonstrated, and the total synthesis of arogenate was achieved for the first time employing imidazolidinone intermediates.

## Experimental section

### 5.1. Material and techniques

### 5.1.1. Reagents and solvents

Reagents were purchased from different commercial suppliers (Aldrich, Acros, Alfa Aesar, Fluka, TCI, Merck, Fluorochem, etc.), stored as specified by the manufacturer and used without previous purification unless otherwise stated.

Triethylamine, DBU, DIPA and DIPEA were purified by distillation. Liquid aldehydes were purified by distillation before usage and stored in the fridge at $-30^{\circ} \mathrm{C}$ under nitrogen.

When anhydrous solvents were required, they were dried following established procedures. ${ }^{201}$ Dichloromethane was dried over $\mathrm{CaH}_{2}$, and diethyl ether and tetrahydrofuran were dried by filtration through activated alumina (powder $\approx 150 \mathrm{mesh}$, pore size $58 \AA$, basic, Sigma aldrich) columns.

### 5.1.2. General experimental

All non-aqueous reactions were performed under inhert atmosphere using ovendried glassware and were magnetically stirred. Yields refer to chromatographically purified and spectroscopically pure compounds, unless otherwise stated.

Heat requiring reactions were performed using a hotplate with a sand bath and a condenser. Reactions requiring low temperatures were performed using cooling bath circulators Huber T100E and acetone or isopropanol baths.

Organic layers washed with aqueous phases were dried over $\mathrm{MgSO}_{4}$ or $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered through cotton.

Organic solvents were evaporated under reduced pressure using rotavapors Büchi R-110, R-200 and R-210, the latter equipped with a Büchi V-700 vacuum pump and a Büchi V-850 vacuum controller, appropriate for the evaporation of solvents when products were volatile compounds. For the complete removal of solvents vacuum pump Telstar Top-3 ( $\sim 0.5 \mathrm{mmHg}$ ) was employed.

[^70]
### 5.1.3. Chromatography

Reactions and flash chromatographic columns were monitored by thin layer chromatography (TLC) using Merck silica gel 60 F254 plates and visualized by fluorescence quenching under UV light, Fisher Bioblock lamp VL-4LC, $\lambda=254$ and 365 nm . In addition, TLC plates were stained with a dipping solution of potassium permanganate ( 1 g ) in 100 ml of water (limited lifetime), followed by heating.

Chromatographic purification was performed on Merck ROCC 60 silica gel 40$63 \mu \mathrm{~m}$ as stationary phase and a suitable mixture of solvents (typically hexane/ethyl acetate, pentane/diethyl ether or dichloromethane/methanol) as eluent.

### 5.1.4. Optical rotation

Optical rotations were recorded using a Jasco P-2000 polarimeter; specific rotation (SR) $\left([\alpha]_{\mathrm{D}}\right)$ are reported in $10^{-1} \mathrm{deg} \cdot \mathrm{cm}^{2} \cdot \mathrm{~g}^{-1}$; concentrations (c) are quoted in $\mathrm{g} / 100 \mathrm{~mL}$; D refers to the D-line of sodium ( 589 nm ); temperatures ( T ) are given in degree Celsius ( ${ }^{\circ} \mathrm{C}$ ).

### 5.1.5. Melting points

Melting points were determined in open capillaries in a Stuart SHP3 melting point apparatus and microscope and were uncorrected.

### 5.1.6. NMR spectra

NMR spectra were recorded using a Bruker Avance $300\left(300 \mathrm{MHz}\right.$ for ${ }^{1} \mathrm{H}, 75$ MHz for ${ }^{13} \mathrm{C}$ ) spectrometer, Bruker 400 spectrometer ( 400 MHz for ${ }^{1} \mathrm{H}, 100 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ), Varian $400 \mathrm{MR}\left(400 \mathrm{MHz}\right.$ for ${ }^{1} \mathrm{H}, 100 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ) or Bruker AV-500 spectrometer ( 500 MHz for ${ }^{1} \mathrm{H}, 125 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ). Chemical shifts ( $\delta$ ) are quoted in parts per million referenced to the residual solvent peak, usually $\mathrm{CDCl}_{3},{ }^{1} \mathrm{H}(\delta=7.26)$ and ${ }^{13} \mathrm{C}(\delta=77.0)$. The multiplicity of each signal is designated using the following abbreviations: s , singlet; d, doublet; t , triplet; q, quartet; m, multiplet; brs, broad singlet. Coupling constants $(J)$ are reported in Hertz (Hz).

MestrReNova Mnova 8.1 program was used to process and edit the registered spectra.

### 5.1.7. Mass spectra

MS spectra were recorded on an ESI-ion trap Mass spectrometer (Agilent 1100 series LC/MSD, SL model) on a UPLC-DAD-QTOF, Ultra High Performance Liquid Chromatography-Mass spectrometer, Waters UPLC ACQUITY, Waters PDA detector, Waters Sunapt G2 or on an Agilent Thermoquest LCT spectrometer. Mass spectrometry analyses were performed in the General Research Service (SGIker) of the University of the Basque Country (UPV/EHU) or in the Chemistry School in the University of Bristol.

### 5.1.8. Infrared spectra

Infrared spectra were recorded on a Bruker Alpha FT-IR spectrometer as a thin film.

### 5.1.9. Determination of enantiomeric excesses

Enantiomeric excesses were determined using analytical high performance liquid chromatography (HPLC) performed on either a Waters 600 (equipped with Photodiode Array Detector Waters 2996). The used columns were Chiralpack AD-H, AY-H, IA, IB and IC; and flow/solvent conditions are given for each compound.

### 5.1.10. X-Ray diffraction analysis

The X-ray diffraction analysis experiments were conducted in the General Research Service (SGIker) of the University of the Basque Country (UPV/EHU) using difractometers for monocrystals.

### 5.2. Preparation of catalysts

Catalysts C11 [(DHQD) $)_{2}$ PYR] and C34 (quinine) are commercially available and were purchased from commercial suppliers. The remaining catalysts were prepared as follows.

### 5.2.1. Preparation of proline-based aminocatalysts C1-C6

Known catalysts $\mathbf{C 1},{ }^{202} \mathbf{C 5}{ }^{203}$ and $\mathbf{C 6}^{204}$ and the newly prepared catalysts C2-C4 were prepared according to the following synthetic sequence:

## Preparation of (S)-1-(1-benzylpyrrolidin-2-yl)ethan-1-one

[^71]$1^{\text {st }}$ step: ${ }^{205}$ Thionyl chloride ( $4.0 \mathrm{~mL}, 55 \mathrm{mmol}, 1.1$ equiv.) was added dropwise over 5 min to a suspension of L-proline ( $5.76 \mathrm{~g}, 50 \mathrm{mmol}, 1$ equiv.) in methanol at $0^{\circ} \mathrm{C}$, and the resulting solution was stirred at reflux for 1 h . Then, the solvent and excess thionly chloride were eliminated under reduced pressure, affording the crude product as a yellow oil, which was used in the next step without further purification.
$2^{\text {nd }}$ step: ${ }^{206}$ Benzyl bromide ( $6.5 \mathrm{~mL}, 55 \mathrm{mmol}, 1.1$ equiv.) was added dropwise to a solution of the crude product previously obtained ( $8.28 \mathrm{~g}, 50 \mathrm{mmol}, 1$ equiv.) and DIPEA ( $26.1 \mathrm{~mL}, 150 \mathrm{mmol}, 3$ equiv.) in toluene ( 50 mL ) at $0^{\circ} \mathrm{C}$, and the resulting solution was stirred at reflux for 6 h . Then, the reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and a saturated solution of $\mathrm{NaHCO}_{3}(40 \mathrm{~mL})$ was added. The layers were separated and the aqueous phase was extracted with EtOAc $(2 \times 40 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure to afford the crude (S)-1-(1-benzylpyrrolidin-2-yl)ethan-1-one as a brown oil, which was used in the next step without further purification. Yield: $95 \%$ ( $10.3 \mathrm{~g}, 47.5 \mathrm{mmol}$ ). All data were consistent with those previously reported. ${ }^{207}{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.34$, $(\mathrm{m}, 5 \mathrm{H}), 5.15(\mathrm{~m}, 2 \mathrm{H}), 4.35(\mathrm{~m}, 1 \mathrm{H}), 3.86-3.40(\mathrm{~m}, 5 \mathrm{H}), 2.30-1.80(\mathrm{~m}, 4 \mathrm{H})$.

## General procedure for the preparation of catalysts C1-C6

$\mathbf{1}^{\text {st }}$ step: ${ }^{208}$ A solution of the corresponding alkyl or aryl bromide magnesium bromide (3 equiv.) was added dropwise to a stirred solution of the crude ester ( $4.38 \mathrm{~g}, 20 \mathrm{mmol}$, 1 equiv.) in dry THF ( 40 mL ) at $0^{\circ} \mathrm{C}$. The reaction mixture was let to stir at room temperature for 16 h before being cooled to $0^{\circ} \mathrm{C}$ to quench the reaction by adding a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$. The resulting salts were filtered over a path of celite and rinsed with dichloromethane $(3 \times 20 \mathrm{~mL})$. The combined organic phases were

[^72]washed with brine and dried over $\mathrm{MgSO}_{4}$, and the solvent was eliminated under reduced pressure. The desired alcohol was purified by flash column chromatography on silica gel eluting with a 95:5 mixture of hexane/EtOAc.
$\mathbf{2}^{\text {nd }} \mathbf{s t e p}:{ }^{202}$ The product resulting from the previous step and palladium on activated charcoal ( $10 \% \mathrm{wt}$.) ( $20 \% \mathrm{wt}$.) were stirred in EtOH ( $1 \mathrm{~mL} / \mathrm{mmol}$ ) under an hydrogen atmosphere. The resulting suspension was filtered over a pad of celite and the solvent was eliminated under reduced pressure affording the crude unprotected amine, which was used in the next step without further purification.
$\mathbf{3}^{\text {rd }}$ step: ${ }^{202}$ The crude product obtained in the previous step ( $10 \mathrm{mmol}, 1$ equiv.) was dissolved in dichloromethane ( 20 mL ), and DMAP ( $2.43 \mathrm{~g}, 20 \mathrm{mmol}, 2$ equiv.) and the corresponding silyl chloride ( $17.5 \mathrm{mmol}, 1.75$ equiv.) were added at $0^{\circ} \mathrm{C}$. The resulting solution was refluxed for 16 h , and after cooling to room temperature water ( 25 mL ) was added. The layers were separated, the aqueous phase was extracted with dichloromethane ( $3 \times 25 \mathrm{~mL}$ ), and the combined organic phases were washed with a saturated solution of $\mathrm{NaHCO}_{3}(40 \mathrm{~mL})$. The organic phase was then dried over $\mathrm{MgSO}_{4}$, and the solvent was eliminated under reduced pressure. Catalysts C1-C6 were purified by silica gel flash column chromatography eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ mixtures. The pure product was then dissolved in dichloromethane $(20 \mathrm{~mL})$, washed with a saturated solution of $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$ and the organic phase was dried over $\mathrm{MgSO}_{4}$. The solvent was eliminated under reduced pressure to afford the corresponding pure and basified catalyst.

## (S)-2-(2,6-Dimethyl-4-((triphenylsilyl)oxy)heptan-4-yl)pyrrolidine (C1) ${ }^{202}$

C1 was prepared starting from L-proline according to the general procedure described above using ${ }^{i} \mathrm{BuMgBr}\left(2 \mathrm{M}\right.$ solution in $\mathrm{Et}_{2} \mathrm{O}, 30$ $\mathrm{mL}, 60 \mathrm{mmol})$ in the Grignard reaction and $\mathrm{Ph}_{3} \mathrm{SiCl}(5.18 \mathrm{~g}, 17.5$ mmol ) in the silylation step. White solid. m. p.: $112-115{ }^{\circ} \mathrm{C}$. Yield after 5 steps: $61 \%$. All data were consistent with those previously reported. $[\alpha]_{\mathrm{D}}{ }^{25}=$ $+20.3^{\circ}\left(c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.74-7.67(\mathrm{~m}, 6 \mathrm{H}), 7.45-7.33$ $(\mathrm{m}, 9 \mathrm{H}), 3.24(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.74\left(\mathrm{dt}, J_{l}=6.4 \mathrm{~Hz}, J_{2}=12.7 \mathrm{~Hz}, 1 \mathrm{H}\right), 2.69-2.60(\mathrm{~m}$, $1 \mathrm{H}), 1.97-1.79(\mathrm{~m}, 2 \mathrm{H}), 1.74\left(\mathrm{dd}, J_{l}=5.6 \mathrm{~Hz}, J_{2}=14.4 \mathrm{~Hz}, 2 \mathrm{H}\right), 1.59\left(\mathrm{dd}, J_{l}=3.4 \mathrm{~Hz}\right.$, $\left.J_{2}=10.9 \mathrm{~Hz}, 2 \mathrm{H}\right), 1.55-1.48(\mathrm{~m}, 2 \mathrm{H}), 1.50(\mathrm{bs}, 1 \mathrm{H}), 1.33\left(\mathrm{dd}, J_{l}=5.7 \mathrm{~Hz}, J_{2}=14.2\right.$, $2 \mathrm{H}), 0.97(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.90(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 3 \mathrm{H}), 0.70(\mathrm{~d}$, $J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.4,135.8,129.3,127.5,84.2,65.7$, 47.0, 44.8, 27.2, 26.3, 25.3, 25.1, 24.9, 23.8, 23.4. ### 5.2.2. Preparation of squaramide-based Brønsted base catalysts

Squaramide-based catalysts were prepared according to the following synthetic sequence:

### 5.2.2.1. Preparation of catalysts $\boldsymbol{C} 7$ and $\boldsymbol{C 1 2}$

Known catalysts $\mathbf{C} 7^{209}$ and $\mathbf{C 1 2}{ }^{210}$ were synthesised as follows:

## Preparation of squaric ester monoamides

To a solution of 3,4-dimethoxy-3-cyclobutane-1,2-dione ( $280 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) in $\mathrm{MeOH}(20 \mathrm{~mL})$ was added the corresponding amine ( 2.0 mmol ) and the reaction mixture was stirred at room temperature for 48 h . The formed precipitate was filtered and dried in vacuo to give the squaric ester monoamide.

## 3-((3,5-bis(Trifluoromethyl)phenyl)amino)-4-methoxycyclobut-3-ene-1,2-dione ${ }^{211}$

The title compound was prepared according to the general procedure described above using 3,5bis(trifluoromethyl)aniline ( $310 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) as the amine. Yield: $68 \%$ ( $463,1.36 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in literature. ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}\right.$, DMSO- $\left.d_{6}\right) \delta 11.18(\mathrm{~s}, 1 \mathrm{H})$, $8.04(\mathrm{~s}, 2 \mathrm{H}), 7.78(\mathrm{~s}, 1 \mathrm{H}), 4.41(\mathrm{~s}, 3 \mathrm{H})$.

## 3-((3,5-bis(Trifluoromethyl)benzyl)amino)-4-methoxycyclobut-3-ene-1,2-dione ${ }^{212}$

The title compound was prepared according to the general procedure described above using 3,5bis(trifluoromethyl)benzylamine ( $486 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) as the amine. Yield: $62 \%$ ( $438,1.24 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in literature. ${ }^{\mathbf{1}} \mathbf{H}$-NMR (300

[^73]MHz, DMSO- $d_{6}$ ) $\delta 8.94$ (br s, 1H), 7.09 (s, 2H), 7.94 (s, 1H), 4.78 (br s, 2H), 4.26 (s, $3 \mathrm{H})$.

## Preparation of 9-amino-(9-deoxy)epiquinine ${ }^{213}$

$1^{\text {st }}$ step: ${ }^{214}$ A mixture of quinine ( $16.2 \mathrm{~g}, 50 \mathrm{mmol}, 1$ equiv.) and triethylamine ( 25.1 $\mathrm{mL}, 180 \mathrm{mmol}, 3.6$ equiv.) in dry THF ( 250 mL ) was cooled to $0^{\circ} \mathrm{C}$ and then methanesulfonyl chloride ( $7.0 \mathrm{~mL}, 90 \mathrm{mmol}, 1.8$ equiv.) was added dropwise. The mixture was stirred overnight at room temperature. The reaction was quenched with water ( 40 mL ) and then THF was removed under vacuum. The residue was dissolved in dichloromethane ( 40 mL ) and washed with water ( 30 mL ) and a saturated solution of $\mathrm{NaHCO}_{3}(30 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentred under vacuum to afford the crude product in $96 \%$ yield, which was used in the next step without further purification.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{215}$ The crude product ( $19.3 \mathrm{~g}, 48 \mathrm{mmol}, 1$ equiv.) was dissolved in DMF ( 150 mL ). The solution was cooled to $0^{\circ} \mathrm{C}$ and $\mathrm{NaN}_{3}(6.2 \mathrm{~g}, 96 \mathrm{mmol}, 2$ equiv.) was added in portions. The mixture was stirred at $70^{\circ} \mathrm{C}$ for 16 h and after this time the reaction was quenched with water ( 80 mL ) and then ethyl acetate $(150 \mathrm{~mL})$ was added. The organic layer was separated and washed with brine $(10 \times 60 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered and evaporated under reduced pressure to obtain the crude product in quantitative yield, which was used in the next step without further purification.

[^74]$3^{\text {rd }}$ step: ${ }^{215}$ The crude product was dissolved in THF ( 250 mL ) and $\mathrm{PPh}_{3}(12.6 \mathrm{~g}, 48$ mmol, 1 equiv.) was added. The reaction mixture was heated to $40^{\circ} \mathrm{C}$ and stirred until the gas evolution ceased $(\sim 5 \mathrm{~h})$. Then $\mathrm{H}_{2} \mathrm{O}(8 \mathrm{~mL})$ was added and the mixture was stirred overnight at $40^{\circ} \mathrm{C}$. The solvent was removed under vacuum and the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{~mL}) . \mathrm{HCl} 6 \mathrm{M}(250 \mathrm{~mL})$ was added and the aqueous phase was separated and washed with dichloromethane $(2 \times 100 \mathrm{~mL})$. Then the aqueous layer was cooled to $0^{\circ} \mathrm{C}$ and basified until $\mathrm{pH}>10$ with $\mathrm{NaOH} 40 \%$. The aqueous phase was then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 150 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure to afford 9-amino-(9-deoxy)epiquinine as a yellow viscous oil. Yield: $56 \%(8.7 \mathrm{~g}, 26.9 \mathrm{mmol})$. All data were consistent with those previously reported. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta 8.75(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.36-8.05(\mathrm{~m}, 4 \mathrm{H}), 5.79(\mathrm{~m}, 1 \mathrm{H})$, 4.97 (m, 2H), 4.57 (d, $J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.97(\mathrm{~s}, 3 \mathrm{H}), 3.02-3.34(\mathrm{~m}, 3 \mathrm{H}), 2.77(\mathrm{~m}, 2 \mathrm{H})$, $2.27(\mathrm{~m}, 1 \mathrm{H}), 2.08(\mathrm{~s}, 2 \mathrm{H}), 1.26-1.63(\mathrm{~m}, 4 \mathrm{H}), 0.80(\mathrm{~m}, 1 \mathrm{H})$.

## Coupling with squaric ester monoamide

To a suspension of the corresponding squaric ester monoamide prepared above ( 1.0 mmol , 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ) was added 9-amino-(9-deoxy) epiquinine ( 323 $\mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) and the reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluting hexane/EtOAc 50:50 $\rightarrow 0: 100$ ).

## 3-((3,5-bis(Trifluoromethyl)phenyl)amino)-4-(((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)amino)cyclobut-3-ene-1,2-dione (C7) ${ }^{209}$

The title compound was prepared according to the general procedure described above from 3-((3,5-bis(trifluoromethyl)phenyl)amino)-4-methoxycyclobut-3-ene-1,2-dione ( $339 \mathrm{mg}, 1.0 \mathrm{mmol}$ ). Yellow solid. m. p. $223-225{ }^{\circ} \mathrm{C}$. Yield: $70 \%$ ( $441 \mathrm{mg}, 0.70 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in literature. ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 9.88(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 8.80(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H})$, 8.36 (br s, 1H), $8.04-7.86(\mathrm{~m}, 3 \mathrm{H}), 7.76(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.67(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H})$, $7.58(\mathrm{~s}, 1 \mathrm{H}), 7.47(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.19-5.73(\mathrm{~m}, 2 \mathrm{H}), 5.13-4.92(\mathrm{~m}, 2 \mathrm{H}), 3.95(\mathrm{~s}$,

3H), 3.52-3.42 (m, 1H), 3.30-3.25 (m, 1H) $2.77-2.58(\mathrm{~m}, 2 \mathrm{H}), 2.35-2.20(\mathrm{~m}, 1 \mathrm{H})$, $1.60-1.47(\mathrm{~m}, 4 \mathrm{H}), 0.66(\mathrm{~m}, 1 \mathrm{H})$..

## 3-((3,5-bis(Trifluoromethyl)benzyl)amino)-4-(((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)amino)cyclobut-3-ene-1,2-dione (C12) ${ }^{210}$

The title compound was prepared according to the general procedure described above from 3-((3,5-bis(Trifluoromethyl)benzyl)amino)-4-methoxycyclobut-3-ene-1,2-dione ( $353 \mathrm{mg}, 1.0 \mathrm{mmol}$, 1 equiv.). Yield: $64 \%$ ( $413,0.64 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in literature. ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 8.90(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.39(\mathrm{~d}, J=8.3$ $\mathrm{Hz}, 1 \mathrm{H}), 7.93-8.07(\mathrm{~m}, 5 \mathrm{H}), 7.77(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.74(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.66(\mathrm{t}, J=7.7$ $\mathrm{Hz}, 1 \mathrm{H}), 7.62(\mathrm{~d}, J=4.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.06(\mathrm{brs}, 1 \mathrm{H}), 5.79(\mathrm{ddd}, J=17.1,10.5,6.5 \mathrm{~Hz}$, $1 \mathrm{H}), 5.12(\mathrm{~d}, J=17.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.03(\mathrm{~d}, J=10.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.82(\mathrm{~m}, 2 \mathrm{H}), 3.27(\mathrm{q}, J=$ $9.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{dd}, J=13.9,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.89(\mathrm{t}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.81(\mathrm{~m}, 1 \mathrm{H})$, $2.74(\mathrm{dd}, J=14.4,10.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.17(\mathrm{q}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.40-1.55(\mathrm{~m}, 3 \mathrm{H}), 0.83-$ 0.99 (m, 2H).

### 5.2.2.2. Preparation of catalyst $\boldsymbol{C} 8$

Known catalyst $\mathbf{C 8} \mathbf{8}^{216}$ was prepared according to the following synthetic sequence:

$1^{\text {st }}$ step: $:^{217} \mathrm{Na}_{2} \mathrm{CO}_{3}\left(2.12 \mathrm{~g}, 20 \mathrm{mmol}, 2\right.$ equiv.) and $\mathrm{Boc}_{2} \mathrm{O}$ ( $3.3 \mathrm{~g}, 15 \mathrm{mmol}, 1.5$ equiv.) were added to a solution of L-tert-leucine ( $1.31 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in water ( 20 mL )

[^75]and THF ( 5 mL ) at $0^{\circ} \mathrm{C}$. After stirring for 12 h at room temperature $\mathrm{HCl}(10 \%)$ was added until pH 2 and the mixture was extracted with $\mathrm{EtOAc}(3 \times 30 \mathrm{~mL})$. The aqueous phases were combined, washed with brine ( 50 mL ) and dried over $\mathrm{MgSO}_{4}$. After removing the solvent under reduced pressure, the resulting residue was redissolved in dry DMF ( 20 mL ) and DIPEA ( $2.58 \mathrm{~g}, 20 \mathrm{mmol}, 2$ equiv.) and HBTU ( $5.7 \mathrm{~g}, 15 \mathrm{mmol}$, 1.5 equiv.) were added. After stirring for 1 h piperidine ( $0.94 \mathrm{~g}, 11 \mathrm{mmol}, 1.1$ equiv.) was added and the mixture was stirred for further 16 h . The reaction was quenched adding $\mathrm{HCl} 1 \mathrm{M}(20 \mathrm{~mL})$ and the mixture was extracted with EtOAc ( $2 \times 20 \mathrm{~mL}$ ). The organic phases were combined and washed with HCl 1 M and brine ( 20 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was then removed under reduced pressure and the resulting residue was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 8:/15) to afford tert-butyl (S)-(3,3-dimethyl-1-oxo-1-(piperidin-1-yl)butan-2-yl)carbamate as a white solid. Yield: $82 \%$ ( $2.5 \mathrm{~g}, 8.3 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 0.98(\mathrm{~s}, 9 \mathrm{H}), 1.43(\mathrm{~s}, 9 \mathrm{H}), 1.52-1.62(\mathrm{~m}, 6 \mathrm{H}), 3.46-3.69(\mathrm{~m}, 4 \mathrm{H}), 4.54(\mathrm{~d}, J$ $=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.38(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H})$.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p}:{ }^{217}$ The previously obtained amide ( $2.5 \mathrm{~g}, 8 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ and trifluoroacetic acid ( 2 mL ) and stirred at $40^{\circ} \mathrm{C}$ until no more starting material was observed by TLC (eluting with hexane/EtOAc 70:30). The solvent was then removed under reduced pressure and the residue was redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$. The solution was washed with $\mathrm{NaOH}(40 \%)$, dried over $\mathrm{MgSO}_{4}$ and the solvent was removed under reduced pressure to afford the aminoamide as a yellow oil. The aminoamide was then dissolved in dry diethyl ether ( 10 mL ) and was added dropwise over a suspension of lithium aluminiumhydride ( $879 \mathrm{mg}, 24 \mathrm{mmol}, 3$ equiv.) in diethyl ether $(40 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ under nitrogen atmosphere. The mixture was stirred at the same temperature for some minutes and afterwards it was stirred at room temperature for 16 h . The reaction was quenched by the addition of water ( 5 mL ) and $\mathrm{NaOH} 15 \%(1.2 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The resulting mixture was filtered and the filtrate was extracted with diethyl ether ( 2 x 10 mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure. The residue was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 1:1) to afford (S)-3,3-dimethyl-1-(piperidin-1-yl)butan-2-amine as yellow oil. Yield: $92 \%$ $(1.16 \mathrm{~g}, 6.8 \mathrm{mmol})$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.66(\mathrm{dd}, J=11.0,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.52(\mathrm{~d}, J=$ $12.3 \mathrm{~Hz}, 4 \mathrm{H}), 2.28(\mathrm{dd}, J=12.3,2.8 \mathrm{~Hz}, 3 \mathrm{H}), 2.13(\mathrm{dd}, J=12.1,11.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.61-$ $1.53(\mathrm{~m}, 4 \mathrm{H}), 1.44-1.42(\mathrm{~m}, 2 \mathrm{H}), 0.90(\mathrm{~s}, 9 \mathrm{H})$.
${ }^{217}$ Y. Gao, Q. Ren, L. Wang, J. Wang, Chem. Eur. J. 2010, 16, 13068-13071.
$3^{\text {rd }}$ step: ${ }^{216}$ To a solution of the diamine ( $780 \mathrm{mg}, 4.6 \mathrm{mmol}, 1$ equiv.) in methanol ( 30 mL ) the squaric ester monoamide obtained above ( $1.56 \mathrm{~g}, 4.6 \mathrm{mmol}, 1$ equiv.) was added and the mixture was stirred until complete disappearance of the starting amide as monitored by TLC ( 16 h ). The formed white precipitate was filtered and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford essentially pure $\mathbf{C 8}$ as a white solid. m. p. $246-248{ }^{\circ} \mathrm{C}$. Yield: $59 \%$ $(1.29 \mathrm{~g}, 2.6 \mathrm{mmol})$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 10.09(\mathrm{~s}, 1 \mathrm{H}), 8.08(\mathrm{~s}, 2 \mathrm{H}), 7.64(\mathrm{~s}, 1 \mathrm{H}), 4.07-$ $3.93(\mathrm{~m}, 1 \mathrm{H}), 2.49-2.04(\mathrm{~m}, 5 \mathrm{H}), 1.51-1.22(\mathrm{~m}, 6 \mathrm{H}), 0.93(\mathrm{~s}, 9 \mathrm{H})$.

### 5.2.2.3. Preparation of catalyst C10

Known catalyst $\mathbf{C 1 0}^{218}$ was prepared according to the following synthetic sequence:

$1^{\text {st }}$ step: ${ }^{219}$ Glutaraldehyde ( $50 \mathrm{wt} \%$ in $\mathrm{H}_{2} \mathrm{O}, 1.90 \mathrm{~mL}, 10.4 \mathrm{mmol}, 1.04$ equiv.) was added dropwise into a mixture of diamine ( $1.140 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) and $\mathrm{NaBH}(\mathrm{OAc})_{3}(8.500 \mathrm{~g}, 40 \mathrm{mmol}, 4$ equiv.) in 1,2-dichloroethane $(60 \mathrm{~mL})$ at room temperature. The resulting mixture was stirred at room temperature for 3 h , and quenched with $\mathrm{NaOH} 6 \mathrm{M}(30 \mathrm{~mL})$. The organic layer was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic layers were concentrated. The residue was then redissolved in $50 \mathrm{~mL} \mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed with brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated to give the product as a yellow liquid. Yield: $89 \%(1.622 \mathrm{~g}, 8.9 \mathrm{mmol})$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.87-2.68(\mathrm{~m}, 1 \mathrm{H}), 2.67-$ $2.49(\mathrm{~m}, 3 \mathrm{H}), 2.41-2.19(\mathrm{~m}, 2 \mathrm{H}), 2.16-1.92(\mathrm{~m}, 2 \mathrm{H}), 1.88-1.34(\mathrm{~m}, 8 \mathrm{H}), 1.31-0.97$ (m, 4H).

[^76]$\mathbf{2}^{\text {nd }}$ step: ${ }^{218}$ To a suspension of the squaric ester monoamide described above in section 5.2.2.1 ( $339 \mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) in 5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added 2-(piperidin-1yl)cyclohexanamine ( $379 \mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) and the reaction mixture was stirred for 48 h at room temperature. After solvent evaporation the desired product was obtained by silica gel column chromatography (eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}, ~ 98: 2$ ). White solid. m. p. $134-136^{\circ} \mathrm{C}$. Yield: $71 \%$ ( $347 \mathrm{mg}, 0.71 \mathrm{mmol}$ ). All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.88(\mathrm{~s}, 2 \mathrm{H}), 7.43(\mathrm{~s}, 1 \mathrm{H}), 4.00-3.80(\mathrm{~m}, 1 \mathrm{H}), 2.66-2.49(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.14(\mathrm{~m}$, $3 \mathrm{H}), 1.93-1.59(\mathrm{~m}, 4 \mathrm{H}), 1.48-0.98(\mathrm{~m}, 10 \mathrm{H})$.

### 5.2.2.4. Preparation of catalysts C13, C28 and C31-C33

Amide group-bearing squaramide-based catalysts C13, C28 and C31-C33 were prepared according to the following synthetic sequence. Catalyst $\mathbf{C 3 1}{ }^{220}$ was previously described in in our group and the rest were synthesised for the first time:

[^77]1st step: Method A: ${ }^{221} 1$-Methylimidazole ( $1.0 \mathrm{~mL}, 1.25 \mathrm{mmol}, 2.5$ equiv.) was added to a slurry of the corresponding 3-nitrobenzoic acid ( 5 mmol , 1 equiv.) in $\mathrm{CH}_{2} \mathrm{CL}_{2}$ ( 25 mL ) at $0{ }^{\circ} \mathrm{C}$, and the mixture was stirred for $10 \mathrm{~min} . \mathrm{MsCl}(0.58 \mathrm{~mL}, 7.5 \mathrm{mmol}, 1.5$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added to the mixture under $-5^{\circ} \mathrm{C}$. After the resulting mixture was stirred under that temperature for 20 min and then 3,5bis(trifluoromethyl)aniline ( $0.78 \mathrm{~mL}, 5 \mathrm{mmol}, 1$ equiv.) was added. The mixture was stirred at room temperature for $2 \mathrm{~h} . \mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ was then added and a solid precipitated, which was solved in EtOAc ( 50 mL ). The organic layer was washed with brine ( $3 \times 25 \mathrm{~mL}$ ) and dried over anhydrous $\mathrm{MgSO}_{4}$. The solvent was evaporated under reduced pressure and the crude was crushed with diethyl ether to afford the desired amide as a white solid in quantitative yield.

Method B: Oxalyl chloride ( $0.47 \mathrm{~mL}, 5.5 \mathrm{mmol}, 1.1$ equiv.) was added to a suspension of the corresponding 3-nitrobenzoic acid ( $5 \mathrm{mmol}, 1$ equiv.) in dichloromethane ( 5 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen atmosphere. DMF ( 1 drop) was then added and the mixture was allowed to stir at room temperature for 2 h , observing the complete dissolution of the solid. The resulting crude was concentrated under reduced pressure and slowly added to a solution of the corresponding benzylamine ( $5 \mathrm{mmol}, 1$ equiv.) and triethylamine ( 2.1 $\mathrm{mL}, 15 \mathrm{mmol}, 3$ equiv.) in dichloromethane ( 15 mL ) at $0{ }^{\circ} \mathrm{C}$ under nitrogen atmosphere. The reaction mixture was stirred at room temperature overnight and EtOAc ( 30 mL ) was added. The organic phase was washed with aqueous $\mathrm{HCl}(1 \mathrm{M})(2 \times 30 \mathrm{~mL})$ and brine ( 30 mL ), dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure affording the desired amide as a white solid in quantitative yield.
$2^{\text {nd }}$ step: To a solution of the previous benzamide ( 5 mmol ) in EtOAc ( 15 mL ) under inert atmosphere, $\mathrm{Pd} / \mathrm{C}$ was added ( $230 \mathrm{mg}, \mathrm{Pd} 10 \%$ in activated carbon, $10 \%$ in weight). The reaction mixture was stirred under $\mathrm{H}_{2}$ atmosphere ( 1 atm ) at room temperature for 20 h . After that the mixture was filtered over celite and the filtrate was concentrated under reduced pressure to afford the hydrogenated product quantitatively, which was used for the preparation of the corresponding squaric ester monoamide without further purification.
$3^{\text {rd }}$ step: To a solution of 3,4-dimethoxy-3-cyclobutane-1,2-dione ( $280 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) in $\mathrm{MeOH}(20 \mathrm{~mL})$ was added the corresponding amine $(2.0 \mathrm{mmol})$ and the reaction mixture was stirred at room temperature for 48 h . The formed precipitate was filtered and dried in vacuo to give the squaric ester monoamide.
$4^{\text {th }}$ step: To a suspension of the corresponding squaric ester monoamide prepared above ( 1.0 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ) was added 9-amino-(9-deoxy)epiquinine ( $323 \mathrm{mg}, 1.0$

[^78]mmol ) and the reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluting hexane/EtOAc $50: 50 \rightarrow 0: 100$ ), affording the catalysts corresponding catalyst.

N-(3,5-bis(Trifluoromethyl)phenyl)-3-((2-(((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)amino)-3,4-dioxocyclobut-1-en-1-yl)amino)-5-(trifluoromethyl)benzamide (C13)

The title compound was prepared according to the general procedure described above starting from 3-nitro-5-(trifluoromethyl)benzoic acid $(1.2 \mathrm{~g}, 5 \mathrm{mmol}, 1$ equiv.) and 3,5-bis(trifluoromethyl)aniline ( $1.1 \mathrm{~g}, 5$ mmol, 1 equiv.). Yellow solid. Yield of $4^{\text {th }}$ step: $68 \%$ ( $555 \mathrm{mg}, 0.68 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}$ ( 300 MHz , DMSO- $d_{6}$ ) $\delta 10.13(\mathrm{~s}, 1 \mathrm{H}), 9.24(\mathrm{~s}, 1 \mathrm{H}), 8.13(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 1 \mathrm{H})$, $7.81(\mathrm{~s}, 2 \mathrm{H}), 7.55(\mathrm{~s}, 1 \mathrm{H}), 7.31(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.21$ $-6.67(\mathrm{~m}, 8 \mathrm{H}), 5.48-5.16(\mathrm{~m}, 2 \mathrm{H}), 4.46-4.19(\mathrm{~m}, 2 \mathrm{H}), 3.29(\mathrm{~s}, 3 \mathrm{H}), 2.89-2.58(\mathrm{~m}$, $3 \mathrm{H}), 2.15-1.90(\mathrm{~m}, 2 \mathrm{H}), 1.61(\mathrm{~s}, 1 \mathrm{H}), 1.08-0.65(\mathrm{~m}, 4 \mathrm{H}),-0.02(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$-NMR ( 75 MHz , DMSO- $d_{6}$ ) $\delta 184.6,180.1,168.5,164.4,163.0,157.9,147.8,144.3,143.1$, $142.1,140.7,140.3,136.0,131.5,130.9$, 130.5, 127.5, 125.1, 121.2, 120.0, 118.0, $117.5,116.8,114.3,101.5,58.9,55.7,27.3,26.0$. The title compound was prepared according to the general procedure described above starting from 3-nitrobenzoic acid ( $840 \mathrm{mg}, 5 \mathrm{mmol}, 1$ equiv.) and 3,5bis(trifluoromethyl)benzylmethylamine ${ }^{222}(1.3 \mathrm{~g}, 5 \mathrm{mmol}, 1$ equiv.). Yellow solid. Yield of $4^{\text {th }}$ step: $90 \%(700 \mathrm{mg}, 0.90$ mmol). ${ }^{1} \mathbf{H}$-NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.56(\mathrm{~d}, J=4.1 \mathrm{~Hz}$, $1 \mathrm{H}), 7.94(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.80(\mathrm{~s}, 1 \mathrm{H}), 7.75(\mathrm{~d}, J=16.0$ $\mathrm{Hz}, 2 \mathrm{H}), 7.54-7.28(\mathrm{~m}, 4 \mathrm{H}), 6.98(\mathrm{~s}, 2 \mathrm{H}), 6.89-6.73$ (m, $1 \mathrm{H}), 6.22(\mathrm{~s}, 1 \mathrm{H}), 5.87-5.69(\mathrm{~m}, 1 \mathrm{H}), 5.04-4.87(\mathrm{~m}, 2 \mathrm{H})$, $4.85-4.54(\mathrm{~m}, 2 \mathrm{H}), 3.95(\mathrm{~s}, 3 \mathrm{H}), 3.63-3.34(\mathrm{~m}, 2 \mathrm{H}), 3.17(\mathrm{t}, J=11.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.87(\mathrm{~s}$, 3 H ), 2.81-2.63 (m, 2H), 2.35-2.19 (m, 1H), 1.75-1.42 (m, 4H), 0.78-0.64 (m, 1H). ${ }^{13} \mathbf{C}-$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 183.7,181.3,171.5,168.7,163.3,158.7,147.2,144.5$, $143.4,141.0,139.3,138.5,136.0,132.2,131.8,131.3,129.4,127.9,127.0,124.8$, 122.6, 121.7, 121.2, 120.4, 118.7, 117.4, 114.7, 101.1, 77.2, 59.7, 55.9, 50.4, 40.7, 39.3, 37.4, 27.4, 26.1. MS: calculated for $\mathrm{C}_{40} \mathrm{H}_{36} \mathrm{~N}_{5} \mathrm{O}_{4} \mathrm{~F}_{6}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 764.2671; found: 764.2676.

### 5.2.2.5. Preparation of catalysts C14-C17

New catalysts C14-C17 were synthesised as follows:

## Preparation of the imidazolium chlorides

Known imidazolium salt intermediates were prepared according to a previously reported synthetic sequence: ${ }^{223}$

[^79]$\mathbf{1}^{\text {st }}$ step: Triphosgene ( $2.93 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) was slowly added to a solution of the corresponding 1,2-iphenylethylenediamine ( $6.36 \mathrm{~g}, 30 \mathrm{mmol}, 1$ equiv.) and triethylamine ( $12.3 \mathrm{~mL}, 90 \mathrm{mmol}, 3$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(75 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The reaction was then stirred for 5 h at room temperature and quenched adding $\mathrm{H}_{2} \mathrm{O}(60 \mathrm{~mL})$. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 100 \mathrm{~mL})$, and the combined organic phases were washed with brine, dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure to afford the desired intermediate as a yellow solid quantitatively, which was subsequently used without further purification. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.36(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 5 \mathrm{H}), 7.31-7.25(\mathrm{~m}, 5 \mathrm{H}), 5.03(\mathrm{~s}, 2 \mathrm{H}), 4.59(\mathrm{~s}, 2 \mathrm{H})$.
$\mathbf{2}^{\text {nd }}$ step: The solid obtained in the previous step was dissolved in dry THF ( 45 mL ) and it was slowly added to a suspension of $\mathrm{NaH}(2.2 \mathrm{~g}, 90 \mathrm{mmol}, 3$ equiv.) in THF ( 60 mL ). The reaction mixture was stirred at room temperature for 30 min and iodomethane ( 6.9 $\mathrm{mL}, 111 \mathrm{mmol}, 3.7$ equiv.) was added. After completion of the reaction (TLC monitoring) the resulting mixture was filtered through celite and the reaction crude was concentrated under reduced pressure and purified by flash column chromatography (hexane/EtOAc 60:40), affording the dimethylated intermediate as a white solid. Yield: $66 \%(5.2 \mathrm{~g}, 20 \mathrm{mmol})$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.38(\mathrm{dd}, J=5.0,2.0 \mathrm{~Hz}, 6 \mathrm{H}), 7.18(\mathrm{dt}, J=$ $6.1,2.4 \mathrm{~Hz}, 4 \mathrm{H}), 4.12(\mathrm{~s}, 2 \mathrm{H}), 2.74(\mathrm{~s}, 6 \mathrm{H})$.
$3^{\text {rd }}$ step: To a solution of the previously obtained solid ( $5.2 \mathrm{~g}, 20 \mathrm{mmol}, 1$ equiv.) in toluene ( 130 mL ) oxalyl chloride ( $16.8 \mathrm{~mL}, 200 \mathrm{mmol}, 10$ equiv.) was added and the reaction mixture was refluxed for 16 h . The solvent was eliminated under reduced pressure with big care to avoid contact of the compound with air and the resulting white solid was stored under Ar in a desiccator until it was submitted to the next step. ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.61-7.54(\mathrm{~m}, 4 \mathrm{H}), 7.47-7.41(\mathrm{~m}, 6 \mathrm{H}), 5.30(\mathrm{~s}, 2 \mathrm{H}), 3.21$ (s, 6H).

## Preparation of Boc-protected diamines

Previously known Boc-protected diamine intermediates were prepared according to the following synthetic sequence:

$1^{\text {st }}$ step: ${ }^{224}$ The corresponding amino acid ( $50 \mathrm{mmol}, 1$ equiv.) was added to a suspension of $\mathrm{NaBH}_{4}$ ( $4.78 \mathrm{~g}, 125 \mathrm{mmol}, 2.5$ equiv.) in THF ( 120 mL ), and the resulting mixture was cooled to $0^{\circ} \mathrm{C}$ before $\mathrm{I}_{2}(12.7 \mathrm{~g}, 50 \mathrm{mmol}, 1$ equiv.) in THF ( 30 mL ) was added over a 30 min period. Then, the reaction mixture was allowed to warm to room temperature, and after the evolution of gas ceased it was refluxed for 16 h . The reaction was quenched by slow addition of MeOH at $0^{\circ} \mathrm{C}$, and the solvent was removed under reduced pressure. The solid residue was dissolved in $\mathrm{KOH}(20 \% ; 100 \mathrm{~mL}$ ), stirring at room temperature for 4 h and the resulting solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $5 \times 50 \mathrm{~mL}$ ), the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure to afford the corresponding aminoalcohol as a colourless oil, which was used in the next step without further purification. Yield: Cuantitative.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{225}$ To a solution of the previously obtained aminoalcohol ( $30 \mathrm{mmol}, 1$ equiv.) and triethylamine ( $4.2 \mathrm{~mL}, 30 \mathrm{mmol}, 1$ equiv.) in THF ( 90 mL ) $\mathrm{Boc}_{2} \mathrm{O}(6.54 \mathrm{~g}, 30$ mmol, 1 equiv.) was added at $0^{\circ} \mathrm{C}$, and the resulting mixture was allowed to stir at room temperature for 2 h . The solvent was removed under vacuum and the solid residue was redissolved in EtOAc ( 75 mL ), washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 75 \mathrm{~mL})$ and brine ( 75 mL ). The organic phase was then dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure to afford the corresponding $N$-boc aminoalcohol, which was subsequently used without further purification. Yield: Cuantitative.
$3^{\text {rd }}$ step: ${ }^{226}$ A solution of phthalic anhydride ( $3.35 \mathrm{~g}, 22.8 \mathrm{mmol}, 1.5$ equiv.), triphenylphosphine ( $11.9 \mathrm{~g}, 45 \mathrm{mmol}, 3$ equiv.) and the alcohol above obtained ( 15 mmol, 1 equiv.) in dry THF ( 150 mL ) was cooled to $0^{\circ} \mathrm{C}$ and diethylazodicarboxylate (DEAD; $5.95 \mathrm{~mL}, 37.5 \mathrm{mmol}, 2.5$ equiv.) was slowly added. The resulting mixture was

[^80]let to warm to room temperature and it was stirred at the same temperature for 3 h . The solvent was removed under reduced pressure and the product was purified by flash column chromatography (eluting with hexane/EtOAc 80:20), affording the corresponding phthalimide as a white solid. Yield: 80-90\%.
$4^{\text {th }}$ step: ${ }^{226}$ Hydrazine monohydrate ( $2.43 \mathrm{~mL}, 50 \mathrm{mmol}, 5$ equiv.) was added to a solution of the previously obtained solid ( $10 \mathrm{mmol}, 1$ equiv.) in $\mathrm{EtOH}(85 \mathrm{~mL})$ and the mixture was refluxed for 45 min , observing the formation of a white solid. After cooling to room temperature, the mixture was filtered through a pad of celite and the filtrate was washed with $\mathrm{Et}_{2} \mathrm{O}(150 \mathrm{~mL})$. The liquid phase was then washed with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure affording the Boc-protected diamine as a white solid, which was used in the next step without further purification. Yield: 80-85\%.

## tert-Butyl (S)-(1-amino-3,3-dimethylbutan-2-yl)carbamate ${ }^{227}$

 9H), 1.06 (bs, 2H), 0.90 ( $\mathrm{s}, 9 \mathrm{H}$ ).
tert-Butyl ( $\boldsymbol{R}$ )-(1-amino-3-methylbutan-2-yl)carbamate ${ }^{226}$

tert-Butyl (S)-(1-amino-3-phenylpropan-2-yl)carbamate ${ }^{228}$
$\mathrm{Ph}_{\mathrm{NHBoc}}^{\mathrm{NH}_{2}}$ Prepared starting from L-phenylalanine $(2.1 \mathrm{~g}, 8.4 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.34-7.09(\mathrm{~m}, 5 \mathrm{H}), 4.66(\mathrm{bs}, 1 \mathrm{H}), 3.86-3.72(\mathrm{~m}$, $1 \mathrm{H}), 2.83-2.56(\mathrm{~m}, 4 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H}), 1.17$ (bs, 2H).

[^81]
## Preparation of catalysts C14-C17

$\mathbf{1}^{\text {st }}$ step: A solution of the above prepared amine ( $1 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ was added to a solution of the previously obtained imidazolium salt ( $1.5 \mathrm{mmol}, 1.5$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and TEA ( $1.25 \mathrm{~mL}, 9 \mathrm{mmol}, 9$ equiv.) was added to the resulting solution. The reaction mixture was stirred at room temperature for 5 h making sure that the reaction media remained basic, and then the reaction was quenched by adding HCL 3 M . The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$ and the combined organic layer was dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure to afford the crude product, which was subsequently purified by flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 90: 10\right)$ affording the pure product as a viscous oil. Yield: 60-70\%.
$\mathbf{2}^{\text {nd }}$ step: The guanidine above obtained ( 0.6 mmol ) was dissolved in TFA and the resulting solution was stirred at room temperature for 2 h . The solvent was then removed under reduced pressure and the residue was redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ). The solution was washed with $\mathrm{NaOH} 2 \mathrm{M}(5 \mathrm{~mL})$ and dried over $\mathrm{MgSO}_{4}$, and the solvent was evaporated under reduced pressure to afford the crude product, which was used in the next step without further purification. Yield: Cuantitative.
$3^{\text {rd }}$ step: To a suspension of the squaric ester monoamide prepared above (Section $5.2 .2 .1,170 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added the previously obtained amine ( $0.5 \mathrm{mmol}, 1$ equiv.) and the reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluting $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 95: 5$ ).

## 3-((3,5-bis(Trifluoromethyl)phenyl)amino)-4-(((S)-1-(((4S,5S)-1,3-dimethyl-4,5-diphenylimidazolidin-2-ylidene)amino)-3,3-dimethylbutan-2-yl)amino)cyclobut-3ene 1,2-dione (C14)

The title compound was prepared from tertbutyl (S)-(1-amino-3,3-dimethylbutan-2yl)carbamate ( $182 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) and the $S, S-$ imidazolium salt. Yellow solid. m. p. $=137-141$ ${ }^{\circ} \mathrm{C}$. ### 5.2.2.6. Preparation of catalysts $\boldsymbol{C 1 8}$ and $\mathbf{C 2 2}$

New catalysts C18 and C22 were synthesised as follows:

## Preparation of the thiourea intermediate

The known thiourea intermediate was prepared following a previously described synthetic sequence: ${ }^{229}$

[^82]

$\mathbf{1}^{\text {st }}$ step: A solution of diethyl $(2 R, 3 R)$-2,3- $O$-isopropildentartrate $(14.8 \mathrm{~g}, 60 \mathrm{mmol}, 1$ equiv.) in THF ( 15 mL ) was slowly added to phenylmagnesium bromide ( 3 M in THF; $100 \mathrm{~mL}, 300 \mathrm{mmol}, 5$ equiv.) at $0^{\circ} \mathrm{C}$, and the reaction mixture was refluxed for 1.5 h . After cooling, a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(400 \mathrm{~mL})$ was added, and the organic phase was separated. The aqueous phase was then extracted with EtOAc ( $1 \times 150 \mathrm{~mL}$ ) and the combined organic layers were washed with brine and dried over $\mathrm{MgSO}_{4}$, and the solvent was evaporated under reduced pressure to afford the crude product, which was purified by recrystallization from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /hexane, affording the diol as a white solid. All spectroscopic data were identical to those reported in the literature. Yield: $95 \%(27 \mathrm{~g}$, $57 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.55(\mathrm{~m}, 4 \mathrm{H}), 7.35(\mathrm{~m}, 16 \mathrm{H}), 4.61(\mathrm{~s}, 2 \mathrm{H})$, 3.95 ( $\mathrm{s}, 2 \mathrm{H}$ ), 1.05 ( $\mathrm{s}, 6 \mathrm{H}$ ).
$2^{\text {nd }}$ step: To a solution of the diol ( $4.7 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL})$ at room temperature thionyl chloride was added ( $1.8 \mathrm{~g}, 30 \mathrm{mmol}, 3$ equiv.) and the mixture was warmed to reflux and TEA ( $4.2 \mathrm{~g}, 42 \mathrm{mmol}, 4.2$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL}$ ) was added during a 3 h period. The reaction mixture was stirred until complete consumption of the starting material was observed by TLC, and the solvent was eliminated under reduced pressure. The residue was dissolved in DMF ( 50 mL ) and to this solution sodium azide ( $2.6 \mathrm{~g}, 40 \mathrm{mmol}, 4$ equiv.) was added and the reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for 72 h . After cooling to room temperature, $\mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$ was added and the aqueous solution was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 100 \mathrm{~mL})$. The combined organic layer was washed with water ( $3 \times 100 \mathrm{~mL}$ ) dried over $\mathrm{MgSO}_{4}$, and the solvent was evaporated under reduced pressure to afford the crude product, which was purified by flash column chromatography (eluting hexane /acetate 80:20) to afford the diazide as a yellow solid. All spectroscopic data were identical to those reported in the literature. Yield: 84\% (3.9 g, 8.4 mmol$).{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39(\mathrm{~m}, 20 \mathrm{H}), 4.64(\mathrm{~s}, 2 \mathrm{H}), 1.07(\mathrm{~s}, 6 \mathrm{H})$.
$3^{\text {rd }}$ step: To a solution of the above obtained diazide ( $3.6 \mathrm{~g}, 7 \mathrm{mmol}, 1$ equiv.) in dry THF ( 40 mL ) at $0{ }^{\circ} \mathrm{C}$ was added dropwise a suspension of $\mathrm{LiAlH}_{4}(1,6 \mathrm{~g}, 42 \mathrm{mmol}, 6$ equiv.) in dry THF ( 40 mL ) and the reaction mixture was stirred at the same temperature for further 4 h . Then, $\mathrm{NaOH} 1 \mathrm{M}(5 \mathrm{~mL})$ was added dropwise, the mixture
was diluted with $\mathrm{Et}_{2} \mathrm{O}(200 \mathrm{~mL})$ and $\mathrm{Na}_{2} \mathrm{SO}_{4} \cdot 10 \mathrm{H}_{2} \mathrm{O}(20 \mathrm{~g})$ was added. The mixture was stirred for 2 h at room temperature before being filtered, and the filtrate was dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure to afford the crude product. The product was purified by flash column chromatography (eluting $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 80: 20$ ) to afford the diamine as a white solid. All spectroscopic data were identical to those reported in the literature. Yield: $53 \%(1.72 \mathrm{~g}, 3.7 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.56(\mathrm{~m}, 4 \mathrm{H}), 7.35(\mathrm{~m}, 6 \mathrm{H}), 7.19(\mathrm{~m}, 10 \mathrm{H}), 4.28(\mathrm{~s}, 2 \mathrm{H})$, 2.32 (brs, 4H), 1.12 (s, 6H).
$4^{\text {th }}$ step: To a solution of the diamine obtained above ( $1.4 \mathrm{~g}, 3.0 \mathrm{mmol} 1$ equiv.) in pyridine ( 5 mL ) was added carbon disulphide ( $361 \mu \mathrm{~L}, 6.0 \mathrm{mmol}, 2$ equiv.) and the resulting mixture was stirred at $60{ }^{\circ} \mathrm{C}$ for 7 h . Then $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ were added and the pH was adjusted to 2 adding HCl 1 M dropwise. The layers were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{~mL})$ and the combined organic layers were washed with $\mathrm{NaOH} 1 \mathrm{M}(1 \times 50 \mathrm{~mL})$ and brine ( $1 \times 50$ mL ), subsequently. The organich phase was dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure to afford the crude product, which was crushed with a hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}$ mixture and filtered, affording the pure thiourea as a white solid. All spectroscopic data were identical to those reported in the literature. Yield: $81 \%(1.2 \mathrm{~g}$, $2.4 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.62(\mathrm{~m}, 4 \mathrm{H}), 7.42(\mathrm{~m}, 6 \mathrm{H}), 7.28(\mathrm{~m}, 6 \mathrm{H})$, $7.15(\mathrm{~m}, 4 \mathrm{H}), 6.85(\mathrm{~s}, 2 \mathrm{H}), 4.59(\mathrm{~s}, 2 \mathrm{H}), 1.20(\mathrm{~s}, 6 \mathrm{H})$.

## Preparation of catalysts C18 and C22

$1^{\text {st }}$ step: ${ }^{229}$ The thiourea intermediate above prepared ( $250 \mathrm{mg}, 0.50 \mathrm{mmol}, 1$ equiv.) was added to a suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(1.0 \mathrm{~g}, 7.5 \mathrm{mmol}, 15$ equiv. $)$ and $\mathrm{CuCl}(1.0 \mathrm{~g}, 1.05$ mmol, 2.1 equiv.) in dry THF ( 5 mL ) and the resulting mixture was stirred for 10 min at room temperature before adding the corresponding $N$-phthaloyl-1,2-
diphenylethylenediamine ${ }^{230}$ ( $171 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.). The reaction mixture was then stirred at $40^{\circ} \mathrm{C}$ for 72 h and a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$ was added. Then HCl 1 M was added dropwise until pH 5 was reached, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 20 \mathrm{~mL}$ ), and the combined organic phase was washed with brine ( $1 \times 10$ mL ), dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure to afford the crude product, which was purified by flash column chromatography (eluting $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 95: 5$ ) to afford the guanidine intermediate as a yellow solid. Yield: $60-$ $70 \%$.
$\mathbf{2}^{\text {nd }}$ step: Hydrazine monohydrate ( $0.38 \mathrm{~mL}, 3.0 \mathrm{mmol}, 10$ equiv.) was added to a solution of the previously obtained solid ( $245 \mathrm{mg}, 0.3 \mathrm{mmol}, 1$ equiv.) in $\mathrm{EtOH}(1 \mathrm{~mL})$ and the mixture was refluxed for 45 min , observing the formation of a white solid. After cooling to room temperature, the mixture was filtered through a pad of celite and the filtrate was washed with $\mathrm{Et}_{2} \mathrm{O}(15 \mathrm{~mL})$. The liquid phase was then washed with $\mathrm{H}_{2} \mathrm{O}$ (10 mL ), dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure affording the crude amine, which was crushed in MeOH and filtered to afford the pure intermediate. Yield: 75-85\%.
$\mathbf{3}^{\text {rd }}$ step: To a suspension of the squaric ester monoamide prepared above (Section 5.2.2.1, $68 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added the previously obtained amine ( $0.5 \mathrm{mmol}, 1$ equiv.) and the reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluting hexane/EtOAc 50:50).

## 3-((3,5-bis(Trifluoromethyl)phenyl)amino)-4-(((1R,2R)-2-(((3aR,8aR)-2,2-dimethyl-4,4,8,8-tetraphenylhexahydro-6H-[1,3]dioxolo[4,5-e][1,3]diazepin-6-ylidene)amino)-1,2-diphenylethyl)amino)cyclobut-3-ene-1,2-dione (C18)

The title compound was prepared according to the general procedure above described. Yellow solid. m. p. $=178-182{ }^{\circ} \mathrm{C}$. ### 5.2.2.7. Preparation of catalyst $\boldsymbol{C 1 9}$

New catalyst C19 was prepared according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: ${ }^{231}$ To a solution of the $N$-Boc diamine above prepared (Section 5.2.2.5; 324 $\mathrm{mg}, 1.5 \mathrm{mmol}$, 1 equiv.), $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( 351 mg , 2.6 mmol , 1.7 equiv.) and $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(3.9$

[^84]$\mathrm{mg}, 1 \mathrm{~mol} \%)$ in $\mathrm{MeOH}(9 \mathrm{~mL})$ at $0^{\circ} \mathrm{C} 1 H$-Imidazole-1-sulfonyl azide hydrochloride ${ }^{232}$ ( $372 \mathrm{mg}, 1.8 \mathrm{mmol}, 1.2$ equiv.) was added carefully in small portions and the reaction mixture was allowed to stir at room temperature overnight. The resulting mixture was concentrated under reduced pressure without heating and was diluted with $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{~mL})$ and $\mathrm{Et}_{2} \mathrm{O}(25 \mathrm{~mL})$. The aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 20 \mathrm{~mL})$ and the combined organic layer was washed with brine ( 50 mL ), dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude compound was purified by silica gel column chromatography (eluting hexane/EtOAc 90:10). White solid. All spectroscopic data were identical to those reported in the literature. Yield: $82 \%$, ( $300 \mathrm{mg}, 1.23 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 4.53(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.71-3.54(\mathrm{~m}, 1 \mathrm{H}), 3.47(\mathrm{dd}, J$ $=12.6,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.22(\mathrm{dd}, J=12.4,8.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.46(\mathrm{~s}, 9 \mathrm{H}), 0.93(\mathrm{~s}, 9 \mathrm{H})$.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p}:{ }^{232}$ To a solution of the azide above prepared ( $242 \mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(2.5 \mathrm{~mL})$ was added triphenylphosphine ( $262 \mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) and the resulting solution was stirred until the complete disappearance of the azide was observed (TLC monitoring). The solvent was eliminated under reduced pressure affording the desired product as a white foam, which was subsequently used without further purification. Yield: Cuantitative. ${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.75-7.61(\mathrm{~m}$, $6 \mathrm{H}), 7.57-7.39(\mathrm{~m}, 9 \mathrm{H}), 4.82(\mathrm{~s}, 1 \mathrm{H}), 3.44-3.22(\mathrm{~m}, 2 \mathrm{H}), 3.12-2.89(\mathrm{~m}, 1 \mathrm{H}), 1.43$ (s, 9H), 0.82 ( $\mathrm{s}, 9 \mathrm{H}$ ).
$\mathbf{3}^{\text {rd }}$ step: ${ }^{232}$ The compound obtained in the previous step ( $238 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and TFA ( $1: 1,5 \mathrm{~mL}$ ) and the resulting solution was stirred at room temperature for 10 min . Then the solvent was eliminated under reduced pressure, and the residue was redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and washed with $\mathrm{NaOH} 2 \mathrm{M}(5 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure affording the crude product as a yellow solid, which was used in the next step without further purification.
$4^{\text {th }}$ step: To a suspension of the squaric ester monoamide prepared above (Section 5.2.2.1, $200 \mathrm{mg}, 1.5 \mathrm{mmol}, 3$ equiv.) in $\mathrm{MeOH}(5 \mathrm{~mL})$ was added the previously obtained crude amine ( $0.5 \mathrm{mmol}, 1$ equiv.) and the reaction mixture was stirred for 48 h at room temperature, the solvent evaporated, and the product submitted to purification by silica gel column chromatography (eluting $\mathrm{CH}_{2} \mathrm{Cl}_{2} \mathrm{MeOH} 90: 10$ ). White solid. Yield after 2 steps: $32 \%$, $(110 \mathrm{mg}, 0.16 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{24}=-25.0^{\circ}\left(c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 11.04(\mathrm{~s}, 1 \mathrm{H}), 8.78(\mathrm{~s}, 1 \mathrm{H}), 8.15(\mathrm{~s}, 2 \mathrm{H}), 7.83-7.71(\mathrm{~m}, 9 \mathrm{H}), 7.71$ $-7.62(\mathrm{~m}, 6 \mathrm{H}), 7.43(\mathrm{~s}, 1 \mathrm{H}), 3.95-3.79(\mathrm{~m}, 1 \mathrm{H}), 3.57-3.39(\mathrm{~m}, 1 \mathrm{H}), 3.21-3.08(\mathrm{~m}$, $1 \mathrm{H}), 0.84(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 184.6,180.4,170.5,164.1,141.0$,

[^85]135.2, 133.5, 133.4, 132.1, 131.9, 130.2, 130.0, 128.6, 128.4, 65.1, 42.6, 34.4, 26.0. MS: calculated for $\mathrm{C}_{36} \mathrm{H}_{33} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~F}_{6} \mathrm{P}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 684.2215; found, 684.2232.

### 5.2.2.8. Preparation of catalysts C29 and C30

Catalyst C29, ${ }^{233}$ previously described in our group, and new catalyst C30 were synthesised as follows:

## Preparation of the squaric ester monoamide

The squaric ester monoamide required for the preparation of catalysts C29 and C30 was prepared according to the synthetic sequence previously reported by our group: ${ }^{233}$

$\mathbf{1}^{\text {st }}$ step: To a solution 5-aminoisophthalic acid ( $1.81 \mathrm{~g}, 10 \mathrm{mmol}, 1.0$ equiv.) in MeOH ( 20 mL ) was added concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(4.32 \mathrm{~mL}, 80 \mathrm{mmol}, 8$ equiv.). The reaction mixture was stirred for 24 h at $90{ }^{\circ} \mathrm{C}$. After allowing the mixture to reach room temperature, the solvent was removed under reduced pressure. Then, water ( 10 mL ) and NaOH 2 M was added until pH 7 and the mixture was extracted with ethyl acetate ( $3 \times$ 30 mL ). The combined organic phases were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The product was obtained as white solid and used

[^86]without further purification. Yield: $68 \%(1.54 \mathrm{~g}, 6.84 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathbf{N M R}$ ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.05(\mathrm{t}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.92(\mathrm{~s}, 6 \mathrm{H})$.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p : ~ T o ~ a ~ s o l u t i o n ~ o f ~ t h e ~ c r u d e ~ d i m e t h y l ~ 3 - a m i n o p h t a l a t e ~ ( ~} 1.54 \mathrm{~g}, 6.84 \mathrm{mmol}, 1$ equiv.) and $\mathrm{Et}_{3} \mathrm{~N}$ ( $1.0 \mathrm{~mL}, 6.84 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 33 mL ) was added dropwise at $0{ }^{\circ} \mathrm{C}$ acetyl chloride ( $0.54 \mathrm{~mL}, 7.52 \mathrm{mmol}, 1.1$ equiv.). After stirring for 7 h at room temperature, the reaction mixture was filtered and the solid was washed with cool $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 10 \mathrm{~mL})$ to provide the title compound as white solid which was used in the next step without further purification. Yield: $90 \%(1.55 \mathrm{~g}, 6.16 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}(300$ MHz, DMSO- $d_{6}$ ) $\delta 10.39(\mathrm{~s}, 1 \mathrm{H}), 8.46(\mathrm{~d}, J=1.4 \mathrm{~Hz}, 2 \mathrm{H}), 8.21-8.10(\mathrm{~m}, 1 \mathrm{H}), 3.89(\mathrm{~s}$, $6 \mathrm{H}), 2.08$ ( $\mathrm{s}, 3 \mathrm{H}$ ).
$3^{\text {rd }}$ step: A solution of the acetamide ester product obtained above ( $520 \mathrm{mg}, 2.0 \mathrm{mmol}$, 1 equiv.) in THF ( 5 mL ) was added dropwise at $0{ }^{\circ} \mathrm{C}$ to a solution of 3,5bis(trifluoromethyl)phenyl magnesium bromide ( $3.2 \mathrm{~mL}, 0.5 \mathrm{M}$ in THF, 8 equiv.) and the mixture was stirred at $90^{\circ} \mathrm{C} 16 \mathrm{~h}$. The reaction was cooled to room temperature, quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}$ and solvent evaporated under reduced pressure. The resulting residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$, and the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 7:3) to give the title compound as a brown solid. Yield: $79 \%(1.03 \mathrm{~g}, 1.57 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86-7.78(\mathrm{~m}, 4 \mathrm{H}), 7.64(\mathrm{~d}$, $J=1.7 \mathrm{~Hz}, 8 \mathrm{H}), 7.44(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.34(\mathrm{~s}, 1 \mathrm{H}), 2.03(\mathrm{~s}, 3 \mathrm{H})$.
$4^{\text {th }}$ step: To a solution of the amide obtained above ( $522 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) in $\mathrm{MeOH}(4.0 \mathrm{~mL})$ and water $(0.5 \mathrm{~mL})$ was added $\mathrm{NaOH}(400 \mathrm{mg}, 10 \mathrm{mmol}, 20$ equiv.) and the mixture was heated at $85^{\circ} \mathrm{C}$ for 3 d . The reaction mixture was neutralized by slow addition of HCl 1 M until pH 7 , and then it was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10$ mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure to give the primary amine as a brown solid, which was used in the next step without further purification. Yield: $85 \%$ ( $431 \mathrm{mg}, 0.43 \mathrm{mmol}$ ). ${ }^{1} H-N M R(300 ~ M H z, ~ C D C l ~ 3) ~ \delta ~ 7.88-7.78(m, ~ 4 H), ~ 7.68(d, ~ J=1.7 ~ H z, ~ 8 H), ~ 6.52 ~(d, ~ J ~$ $=1.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.08(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H})$.
$\mathbf{5}^{\text {th }}$ step: To a solution of 3,4-dimethoxy-3-cyclobutane-1,2-dione ( $60 \mathrm{mg}, 2.43 \mathrm{mmol}$ ) in $\mathrm{MeOH}(20 \mathrm{~mL})$ was added the above obtained amine ( $430 \mathrm{mg}, 0.43 \mathrm{mmol}$ ) and the reaction mixture was stirred at room temperature for 48 h . The formed precipitate was filtered and dried in vacuo to give the squaric ester monoamide. ${ }^{\mathbf{1}} \mathbf{H}$-NMR $(300 \mathrm{MHz}$, $\left.\mathrm{MeOH}-d_{4}\right) \delta 8.02-7.89(\mathrm{~m}, 4 \mathrm{H}), 7.76(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 8 \mathrm{H}), 7.49(\mathrm{t}, J=2.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.68$ ( $\mathrm{s}, 1 \mathrm{H}$ ), $4.27(\mathrm{~s}, 3 \mathrm{H})$. Yield: $81 \%$ ( $387 \mathrm{mg}, 0.35 \mathrm{mmol}$ ).

## Preparation of 9-amino-10,11-dihydro-(9-deoxy)epiquinine ${ }^{234}$

9-amino-(9-deoxy)epiquinine ( $647 \mathrm{mg}, 2 \mathrm{mmol}$ ) and palladium on activated charcoal ( $10 \% \mathrm{wt}$.) ( $130 \mathrm{mg}, 20 \% \mathrm{wt}$.) were stirred in $\mathrm{EtOH}(1 \mathrm{~mL} / \mathrm{mmol})$ under an hydrogen atmosphere ( 1 atm ). The resulting suspension was filtered over a pad of celite and the solvent was eliminated under reduced pressure affording the crude amine, which was used in the next step without further purification. Yield: Cuantitative. ${ }^{1} \mathbf{H}$-NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.75(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.04(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.75-7.61(\mathrm{~m}, 1 \mathrm{H})$, $7.53-7.45(\mathrm{~m}, 1 \mathrm{H}), 7.39(\mathrm{dd}, J=9.2,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.60(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.97(\mathrm{~s}$, $3 \mathrm{H}), 3.32-3.17(\mathrm{~m}, 2 \mathrm{H}), 3.13-2.97(\mathrm{~m}, 1 \mathrm{H}), 2.79$ (ddd, $J=14.7,10.2,5.4 \mathrm{~Hz}, 1 \mathrm{H})$, 2.53 (ddd, $J=13.7,4.6,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.62-1.48(\mathrm{~m}, 2 \mathrm{H}), 1.38-1.27(\mathrm{~m}, 2 \mathrm{H}), 1.27-$ $1.23(\mathrm{~m}, 2 \mathrm{H}), 0.83(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H})$.

## Preparation of catalysts C29 and C30

Catalysts C29 and C30 were prepared from the squaric ester monoamide intermediate above synthesised according to the synthetic sequence previously described in our group: ${ }^{233}$

[^87]$\mathbf{1}^{\text {st }}$ step: To a solution of the squaric ester monoamide prepared above ( $218 \mathrm{mg}, 0.20$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added the corresponding amine $(0.20 \mathrm{mmol})$ and the reaction mixture was stirred for 48 h at room temperature. The solvent was evaporated, and the crude product was subsequently used without further purification.
$2^{\text {nd }}$ step: To a suspension of the previously prepared diol-squaramide $(0.20 \mathrm{mmol}, 1$ equiv.) and DMAP ( $80 \mathrm{mg}, 0.60 \mathrm{mmol}, 3$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.8 \mathrm{~mL})$ was added dropwise chlorotrimethylsilane ( $80 \mu \mathrm{~L}, 0.60 \mathrm{mmol}, 3$ equiv.) and the reaction mixture was stirred for 14 h at room temperature. Then, additional $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \mathrm{~mL})$ was added and the mixture was washed with water $(2 \times 4 \mathrm{~mL})$ and $\mathrm{HCl} 1 \mathrm{M}(2 \times 4 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated. The resulting residue was subjected to purification by flash column chromatography on silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 98: 2\right)$ affording the pure catalyst.

## 3-((3,5-bis(bis(3,5-bis(Trifluoromethyl)phenyl)((trimethylsilyl)oxy)methyl)phenyl) amino)-4-(((1S)-(6-methoxyquinolin-4-yl)(5-vinylquinuclidin-2-yl)methyl)amino)cyclobut-3-ene-1,2-dione (C29) ${ }^{233}$

The title compound was prepared according to the general procedure described above using 9-amino-(9deoxy)epiquinine ( $65 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.). Yellow solid. m. p. $=160-168^{\circ} \mathrm{C}$. Yield of after 2 steps: $47 \%$ ( $145 \mathrm{mg}, 0.094 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 8.47 (d, $J=4.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.82(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 13 \mathrm{H})$, $7.71(\mathrm{~s}, 1 \mathrm{H}), 7.65-7.37(\mathrm{~m}, 2 \mathrm{H}), 7.40-7.24(\mathrm{~m}, 1 \mathrm{H})$, $7.24-7.12(\mathrm{~m}, 1 \mathrm{H}), 7.12-7.03(\mathrm{~m}, 1 \mathrm{H}), 6.14(\mathrm{~s}, 1 \mathrm{H})$, $5.85-5.61(\mathrm{~m}, 1 \mathrm{H}), 5.11-4.92(\mathrm{~m}, 2 \mathrm{H}), 3.95(\mathrm{~s}, 3 \mathrm{H}), 3.43-3.03(\mathrm{~m}, 3 \mathrm{H}), 2.43-2.27$ (m, 1H), $1.79-1.58(\mathrm{~m}, 3 \mathrm{H}), 1.49(\mathrm{t}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.37-1.21(\mathrm{~m}, 1 \mathrm{H}), 0.78$ (td, $J$ $=17.3,13.8,6.5 \mathrm{~Hz}, 1 \mathrm{H}),-0.28(\mathrm{~s}, 18 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 185.1,180.5$, $168.1,164.9,159.7,148.2,147.4,147.0$, 145.1, 140.8, 140.6, 132.7, 129.4, 129.0, 128.7, 125.4, 124.0, 122.7, 121.8, 118.2, 118.1, 115.9, 101.6, 84.0, 60.7, 59.4, 56.7, $56.3,41.3,39.2,31.6,30.4,27.6,26.5,1.7$. ### 5.2.3. Preparation of thiourea- and urea-based Brønsted base catalysts C9, C20 and C26

Known thiourea/urea-based catalysts C9 ${ }^{235}$ and C26 ${ }^{236}$ and new thiourea-based catalyst $\mathbf{C 2 6}$ were prepared according to the following synthetic procedure: ${ }^{237}$

To a solution of the corresponding amine ( $5 \mathrm{mmol}, 1$ equiv.) in THF ( 7.5 mL ) at $0^{\circ} \mathrm{C}$, a solution of bis(trifluomethyl)phenyl isothiocyanate ( $1.5 \mathrm{~g}, 5.5 \mathrm{mmol}, 1.1$ equiv.) or bis(trifluomethyl)phenyl isocyanate ( $0.6 \mathrm{~mL}, 5.5 \mathrm{mmol}, 1.1$ equiv.) in THF ( 2.5 mL ) was added dropwise. The reaction mixture was stirred overnight at room temperature and then concentrated under reduced pressure. The residue was purified by flash column

[^88]chromatography on silica gel (eluting with hexane/ ethyl acetate $80: 20 \rightarrow 0: 100$ ) to afford compounds C9, C20 and C26.

1-(3,5-bis(trifluoromethyl)phenyl)-3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)thiourea (C9) ${ }^{235}$

C9 was prepared from bis(trifluomethyl)phenyl isothiocyanate ( $1.5 \mathrm{~g} \mathrm{~mL}, 5.5 \mathrm{mmol}$ ) using 9-amino-(9deoxy)epiquinine ( $1.6 \mathrm{~g}, 5 \mathrm{mmol}, 1$ equiv.) as the amine, according to the general procedure described above. White solid. m. p.: $123-125^{\circ} \mathrm{C}$. Yield: $88 \% ~(2.6 \mathrm{~g}, 4.4 \mathrm{mmol})$. All data were consistent with those previously reported. ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{MeOH}-d_{4}\right) \delta 8.68(\mathrm{~d}, J=4.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.11$ (brs, 2 H ), 8.07 (d, $J=$ $2.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.95(\mathrm{~d}, J=9.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.59$ (br s, 1H), 7.55 (d, $J=4.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.44$ (dd, $J=9.3,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.32(\mathrm{~d}, J=11.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.84(\mathrm{ddd}, J=17.2,10.5,6.2 \mathrm{~Hz}, 1 \mathrm{H})$, $5.02(\mathrm{dt}, J=10.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}),, 4.98(\mathrm{dt}, J=17.2,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.03(\mathrm{~s}, 3 \mathrm{H}), 3.56-3.53$ (m, 1H), 3.39-3.37 (m, 1H), 3.29 (dd, $J=13.6,9.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.82$ (ddd, $J=15.6,13.8$, $4.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.79$ (ddd, $J=13.6,4.7,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.38-2.35(\mathrm{~m}, 1 \mathrm{H}), 1.71-1.68$ (m, $2 \mathrm{H}), 1.64-1.61(\mathrm{~m}, 1 \mathrm{H}), 1.45(\mathrm{ddd}, J=13.3,10.4,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 0.89(\mathrm{dd}, J=13.3,10.4$ $\mathrm{Hz}, 1 \mathrm{H})$.

1-(3,5-bis(Trifluoromethyl)phenyl)-3-((S)-1-(((4R,5R)-1,3-dimethyl-4,5-diphenylimidazolidin-2-ylidene)amino)-3-phenylpropan-2-yl)thiourea (C20)

C20 was prepared from bis(trifluomethyl)phenyl isothiocyanate ( $50 \mu \mathrm{~L}, 0.27 \mathrm{mmol}, 1.1$ equiv.) using the corresponding amine above prepared (section 5.2.2.5, $92 \mathrm{mg}, 0.23 \mathrm{mmol}, 1$ equiv.) as the amine, according to the general procedure described above. White solid. Yield: $25 \%(39 \mathrm{mg}, 0.06 \mathrm{mmol}) .[\alpha] \mathrm{D}^{23}=+2.5^{\circ}\left(c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{1} H-N M R(300 ~ M H z, ~ M e O H-d 4) ~ \delta 8.17(s, 1 H), 7.73(\mathrm{~s}, 1 \mathrm{H}), 7.50-7.30(\mathrm{~m}, 10 \mathrm{H}), 7.24$ -7.17 (m, 5H), $7.05(\mathrm{~s}, 1 \mathrm{H}), 4.80-4.66(\mathrm{~m}, 1 \mathrm{H}), 4.49(\mathrm{dd}, J=12.0,6.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.17$ (s, 2H), $4.13-4.05(\mathrm{~m}, 1 \mathrm{H}), 3.02(\mathrm{dd}, J=13.0,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.88(\mathrm{dd}, J=13.7,8.5 \mathrm{~Hz}$, $1 \mathrm{H}), 2.72(\mathrm{~s}, 1 \mathrm{H}), 2.60(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 178.7,177.8,157.4$, $151.2,139.8,137.6,135.1,129.3,129.0,128.7,127.6,127.2,124.3,122.0,119.6$, 112.9, 73.2, 57.2, 52.9, 41.4, 34.1. MS: calculated for $\mathrm{C}_{35} \mathrm{H}_{34} \mathrm{~N}_{5} \mathrm{SF}_{6}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 670.2439 ; found: 670.2439 .

## 1-(3,5-bis(trifluoromethyl)phenyl)-3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)urea (C26) ${ }^{236}$

C26 was prepared from bis(trifluomethyl)phenyl isocyanate ( $0.6 \mathrm{~mL}, 5.5 \mathrm{mmol}$ ) using 9-amino-(9deoxy)epiquinine ( $1.6 \mathrm{~g}, 5 \mathrm{mmol}, 1$ equiv.) as the amine, according to the general procedure described above. White solid. m. p.: $132-135^{\circ} \mathrm{C}$. Yield: $82 \%$ ( $2.4 \mathrm{~g}, 4.1 \mathrm{mmol}$ ). All data were consistent with those previously reported. ${ }^{1} H-N M R(300 ~ M H z, ~ M e O H-d 4) ~ \delta 8.58(d, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.84-7.90(\mathrm{~m}, 3 \mathrm{H}), 7.66(\mathrm{~d}$, $J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{~d}, J=4.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.36(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.34(\mathrm{~d}, J=2.5 \mathrm{~Hz}$, $1 \mathrm{H}), 5.83-5.89(\mathrm{~m}, 1 \mathrm{H}), 5.65(\mathrm{bs}, 1 \mathrm{H}), 5.18$ (d, $J=17.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.09$ (d, $J=10.5 \mathrm{~Hz}$, $1 \mathrm{H}), 3.91(\mathrm{~s}, 3 \mathrm{H}), 3.47-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.35-3.41(\mathrm{~m}, 1 \mathrm{H}), 3.03-3.15(\mathrm{~m}, 4 \mathrm{H}), 2.41-2.43$ $(\mathrm{m}, 1 \mathrm{H}), 1.40-1.73(\mathrm{~m}, 3 \mathrm{H}), 1.17-1.25(\mathrm{~m}, 3 \mathrm{H})$.

### 5.2.4. Ureidopeptide-like Brønsted base catalysts C21, C27 and C35

New catalyst C21 and known catalysts $\mathbf{C 2 7}{ }^{238}$ and $\mathbf{C 3 5}{ }^{234}$ were prepared according to the synthetic sequence previously reported by our group: ${ }^{234}$

$\mathbf{1}^{\text {st }}$ step: ${ }^{239}$ To a stirred solution of the aryl alcohol ( $10 \mathrm{mmol}, 1$ equiv.) in dichloromethane ( 50 mL ) at $0^{\circ} \mathrm{C}$ was added pyridine ( $0.92 \mathrm{~mL}, 11.5 \mathrm{mmol}, 1.15$ equiv.) followed by triphosgene ( $1.2 \mathrm{~g}, 4 \mathrm{mmol}, 0.4$ equiv.) or $p$-nitropheylchloroformate ( 2.2 $\mathrm{g}, 11 \mathrm{mmol}, 1.1$ equiv.). The resulting mixture was stirred at room temperature overnight, and then it was partially evaporated at reduced pressure and diluted with hexane ( 50 mL ). The solids were removed by filtration and the filtrate was evaporated to afford the corresponding chloroformate in quantitative yield, which was used for the next step without further purification.

[^89]$\mathbf{2}^{\text {nd }}$ step: ${ }^{240}$ To a stirred solution of the $L$-tert-leucine ( $1.3 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in $10 \%$ aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}(26 \mathrm{~mL})$, and dioxane ( 10 mL ) was slowly added at $0^{\circ} \mathrm{C}$ a solution of the previous chloroformate ( $1.4 \mathrm{~mL}, 10 \mathrm{mmol}, 1$ equiv.) in dioxane ( 30 mL ). The mixture was stirred at the same temperature for 1 h and then allowed to warm to room temperature. The solution was subsequently stirred overnight, poured into $\mathrm{H}_{2} \mathrm{O}$ (100 $\mathrm{mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The aqueous layer was cooled in an ice bath and acidified with concentrated HCl , followed by extraction with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined extracts were dried over $\mathrm{MgSO}_{4}$, filtered off and the solvent evaporated under reduced pressure to afford the corresponding l-tert-leucine derivative in quantitative yield, which was used for the next step without further purification.
$\mathbf{3}^{\text {rd }} \boldsymbol{s t e p}:{ }^{241}$ The previously obtained acid ( $5.0 \mathrm{mmol}, 1$ equiv.) was dissolved in THF ( 20 mL ), and isobutyl chloroformate ( $0.65 \mathrm{~mL}, 5 \mathrm{mmol} 1$ equiv.) and N -methylmorpholine ( $0.6 \mathrm{~mL}, 5 \mathrm{mmol} 1$ equiv.) were added. Then, the mixture was stirred at $-20^{\circ} \mathrm{C}$ for 20 min and a suspension of $\mathrm{NaN}_{3}(0.48 \mathrm{~g}, 7.5 \mathrm{mmol}, 1.5$ equiv., $)$ in $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ was added. After 30 min at the same temperature, the organic layer was separated, diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$, and washed with water ( 15 mL ). The organic phase was dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure to give a yellow oil which was redissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$. The resulting solution was heated at $40^{\circ} \mathrm{C}$ under nitrogen until completion (reaction monitored by IR analysis until disappearance of the isocyanate band, $1-2 \mathrm{~h}$ ). Then, the corresponding amine was added ( $3.5 \mathrm{mmol}, 0.7$ equiv.) and the reaction mixture was stirred overnight at room temperature. The solvent was evaporated and the residue was purified by flash column chromatography on silica gel (eluting with dichloromethane/MeOH 90:10) to afford the corresponding catalyst.

Naphthalen-2-ylmethyl ((S)-1-(3-((S)-(6-methoxyquinolin-4-yl))((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)ureido)-2,2-dimethylpropyl)carbamate (C21)

C21 was prepared from benzyl alcohol (1.0 $\mathrm{g}, 10 \mathrm{mmol}$ ) according to the general procedure using triphosgene ( $1.2 \mathrm{~g}, 4.0$ mmol, 0.4 equiv.) in the first step and the corresponding amine above prepared (section $5.2 .2 .5,140 \mathrm{mg}, 3.5 \mathrm{mmol}, 1$ equiv.) as the amine. Yield: $30 \%(70 \mathrm{mg}, 0.11 \mathrm{mmol})$. $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=-8.9^{\circ}\left(c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.43-7.10(\mathrm{~m}, \mathbf{2 0 H})$, $6.89(\mathrm{~s}, 1 \mathrm{H}), 5.37(\mathrm{bs}, 1 \mathrm{H}), 4.95(\mathrm{~d}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.76-4.64(\mathrm{~m}, 1 \mathrm{H}), 4.38-4.20$

[^90](m, 3H), 3.51 (d, $J=6.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), 3.15 (dd, $J=13.3,5.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.86 (s, 1H), 2.65 (s, $6 \mathrm{H}), 0.98$ (s, 9H). ${ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 159.7,158.4,155.7,138.5,136.4$, $135.8,129.2,128.5,128.2,127.7,127.4,126.4,77.2,74.0,66.1,51.4,47.1,40.1,36.0$, 33.6, 25.5. MS: calculated for $\mathrm{C}_{40} \mathrm{H}_{49} \mathrm{~N}_{6} \mathrm{O}_{3}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 661.3866; found: 661.3865 .

## Benzyl ((S)-1-(3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)ureido)-2,2-dimethylpropyl)carbamate (C27) ${ }^{238}$

C27 was prepared from benzyl alcohol ( $1.0 \mathrm{~g}, 10$ mmol ) according to the general procedure using triphosgene ( $1.2 \mathrm{~g}, 4 \mathrm{mmol}, 0.4$ equiv.) in the first step and 9-amino-(9-deoxy)epiquinine ( $1.12 \mathrm{~g}, 3.5$ mmol, 1 equiv.) as the amine. Yield: $72 \%(1.48 \mathrm{~g}$, 2.5 mmol ). All data were consistent with those previously reported. ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.62(\mathrm{~d}, J=4.3,1 \mathrm{H}), 8.01(\mathrm{~d}, J=$ $9.2,1 \mathrm{H}), 7.74(\mathrm{~d}, J=2.6,1 \mathrm{H}), 7.39(\mathrm{~d}, J=2.7,1 \mathrm{H}), 7.37-7.34(\mathrm{~m}, 5 \mathrm{H}), 7.22(\mathrm{~d}, J=4.4$, $1 \mathrm{H}), 6.48-6.35(\mathrm{bs}, 1 \mathrm{H}), 5.84-5.73(\mathrm{~m}, 1 \mathrm{H}), 5.32-5.29(\mathrm{~m}, 1 \mathrm{H}), 5.20(\mathrm{~d}, J=9.4,1 \mathrm{H})$, $5.08-5.05(\mathrm{~m}, 2 \mathrm{H}), 5.04-4.95(\mathrm{~m}, 3 \mathrm{H}), 3.97(\mathrm{~s}, 3 \mathrm{H}), 3.30-3.23(\mathrm{~m}, 2 \mathrm{H}), 3.12-2.99(\mathrm{~m}$, $1 \mathrm{H}), 2.80-2.70(\mathrm{~m}, 2 \mathrm{H}), 2.34-2.27(\mathrm{~s}, 1 \mathrm{H}), 1.68-1.64(\mathrm{~m}, 2 \mathrm{H}), 1.62-1.56(\mathrm{~m}, 1 \mathrm{H})$, $1.45-1.38(\mathrm{~m}, 1 \mathrm{H}), 0.82(\mathrm{~s}, 10 \mathrm{H})$.

## Naphthalen-2-ylmethyl ((S)-1-(3-((S)-(6-methoxyquinolin-4-yl)((1S,2S,4S,5R)-5-vinylquinuclidin-2-yl)methyl)ureido)-2,2-dimethylpropyl)carbamate (C35) ${ }^{234}$

C35 was prepared from 2-nafthalenemethanol $(1.6 \mathrm{~g}, 10 \mathrm{mmol})$ according to the general procedure using $p$-nitropheylchloroformate ( $2.2 \mathrm{~g}, 11 \mathrm{mmol}, 1.1$ equiv.) in the first step and 9-amino-(9-deoxy)epiquinine ( $1.12 \mathrm{~g}, 3.5$ mmol, 1 equiv.) as the amine. Yield: $86 \%$ (1.9 $\mathrm{g}, 3.0 \mathrm{mmol}$ ). All data were consistent with those previously reported. ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.58(\mathrm{~d}, J=4.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.99(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.87-7.67(\mathrm{~m}, 5 \mathrm{H})$, 7.35 (dd, $J=9.2,2.7 \mathrm{~Hz}, 4 \mathrm{H}), 7.24(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.42-6.24(\mathrm{bs}, 1 \mathrm{H}), 5.85-5.66$ $(\mathrm{m}, 1 \mathrm{H}), 5.33-5.22(\mathrm{bs}, 1 \mathrm{H}), 5.12-4.85(\mathrm{~m}, 4 \mathrm{H}), 3.95(\mathrm{~s}, 3 \mathrm{H}), 3.33-2.98(\mathrm{~m}, 3 \mathrm{H}), 2.87-$ $2.57(\mathrm{~m}, 2 \mathrm{H}), 2.35-2.22(\mathrm{~m}, 1 \mathrm{H}), 1.94-1.78(\mathrm{~m}, 1 \mathrm{H}), 1.69-1.30(\mathrm{~m}, 4 \mathrm{H}), 0.86(\mathrm{~s}, 9 \mathrm{H})$.

### 5.2.5. Preparation of catalysts C23-C25

New catalysts C23-C25 were synthesised according to a previously described synthetic procedure: ${ }^{242}$

The thiourea intermediate above prepared (Section $5.2 .2 .6,250 \mathrm{mg}, 0.50 \mathrm{mmol}$, 1 equiv.) was added to a suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(1.0 \mathrm{~g}, 7.5 \mathrm{mmol}, 15$ equiv.) and CuCl ( $1.0 \mathrm{~g}, 1.05 \mathrm{mmol}, 2.1$ equiv.) in THF ( 5 mL ) and the resulting mixture was stirred for 10 min at room temperature before adding the corresponding amine $(0.50 \mathrm{mmol}, 1$ equiv.). The reaction mixture was then stirred at $40^{\circ} \mathrm{C}$ for 72 h and a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$ was added. Then HCl 1 M was added dropwise until pH 5 was reached, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$, and the combined organic phase was washed with brine ( $1 \times 10 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure to afford the crude product, which was purified by flash column chromatography (eluting $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 95: 5$ ) to afford the pure catalyst.
(3aR,8aR)- $N$-(3,5-di-tert-Butylphenyl)-2,2-dimethyl-4,4,8,8-tetraphenylhexahydro6 H -[1,3]dioxolo[4,5-e][1,3]diazepin-6-imine (C23)

The title compound was prepared following the general procedure above desctibed using 3,5-di-tert-butylaniline (103 $\mathrm{mg}, 0.50 \mathrm{mmol}, 1$ equiv.) as the amine. Yellow solid. Yield: $64 \% ~(214 \mathrm{mg}, 0.32 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=+53.9^{\circ}(c=1.00$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.95(\mathrm{~d}, J=5.7 \mathrm{~Hz}$, $2 \mathrm{H}), 7.55(\mathrm{~s}, 2 \mathrm{H}), 7.49-7.32(\mathrm{~m}, 8 \mathrm{H}), 7.28(\mathrm{~s}, 5 \mathrm{H}), 7.15(\mathrm{~s}, 3 \mathrm{H}), 7.03(\mathrm{~d}, J=9.1 \mathrm{~Hz}$, $3 \mathrm{H}), 6.85(\mathrm{~s}, 2 \mathrm{H}), 4.75(\mathrm{~d}, J=14.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.34(\mathrm{~s}, 3 \mathrm{H}), 1.24(\mathrm{~s}, 18 \mathrm{H}), 1.19(\mathrm{~s}, 3 \mathrm{H})$. ${ }^{13}$ C NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 152.1,145.3,144.9,141.8,141.2,129.0,128.3,127.7$, $127.6,127.4,127.0,117.3,116.8,110.2,81.2,80.0,66.2,65.6,34.7,31.3,27.0,26.6$. ### 5.3. Experimental section of Chapter 2

### 5.3.1. Synthesis of propargylic aldehydes 1

Phenyl propynal (1a) and octynal (1b) are commercially available and were purchased from commercial suppliers. New propargylic aldehydes 1c and 1d were synthesised as described bellow: ${ }^{242}$

To a round bottomed flask filled with $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{~mL})$ and cooled to $-60^{\circ} \mathrm{C}$ were successively added dropwise ${ }^{\mathrm{n}} \mathrm{BuLi}$ ( $50 \mathrm{mmol}, 20 \mathrm{~mL}, 2.5 \mathrm{M}$ in hexane) and the corresponding alkyne ( 50 mmol ). The reaction mixture was stirred at that temperature for 30 min after which DMF ( $4.3 \mathrm{~mL}, 62.5 \mathrm{mmol}$ ) was added slowly. The resulting mixture was removed from the bath, warmed slowly to room temperature and stirred at this temperature for 20 min . Then, the reaction mixture was poured into a cold solution of water $(25 \mathrm{~mL})$ and concentrated $\mathrm{HCl}(4 \mathrm{~mL})$ and a solution of saturated $\mathrm{NaHCO}_{3}$ was added dropwise until $\mathrm{pH} 6-7$. The organic layer was separated and the aqueous phase extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and the solvent was eliminated under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the corresponding pure ynone $\mathbf{1}$.

## 5-Methylhex-2-ynal (1c)

The compound was prepared according to the general procedure, starting from 4 -methylpent-1-yne ( $1.4 \mathrm{~mL}, 10 \mathrm{mmol}$ ). Black oil. Yield: $63 \%$ ( $700 \mathrm{mg}, 7.0 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.23(\mathrm{~s}, 1 \mathrm{H})$, $2.35(\mathrm{dd}, J=6.5,0.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.04-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.07(\mathrm{~s}, 3 \mathrm{H}), 1.05(\mathrm{~s}, 3 \mathrm{H})$.

## 3-(Thiophen-3-yl)propiolaldehyde (1d)

Prepared according to the general procedure, starting from 3ethynylthiophenone ( $0.98 \mathrm{~mL}, 10 \mathrm{mmol}$ ). Black oil. Yield: $45 \%$ ( 610 $\mathrm{mg}, 4.5 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.40(\mathrm{~s}, 1 \mathrm{H}), 7.82(\mathrm{~d}, J$ $=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.40-7.32(\mathrm{~m}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J=5.0 \mathrm{~Hz}, 1 \mathrm{H})$.

[^91]
### 5.3.2. Synthesis of propargylic ketoesters $2^{243}$

Known ketoester 2a and new ketoesters $\mathbf{2 b} \mathbf{- 2 d}$ were synthesised according to the following synthetic procedure:

To a mixture of copper (I) iodide ( $100 \mathrm{mg}, 0.5 \mathrm{mmol}, 5 \mathrm{~mol} \%$ ) and triethylamine $(2.8 \mathrm{~mL}, 20 \mathrm{mmol}, 2$ equiv.) in THF ( 50 mL ) the corresponding alkyne ( $10 \mathrm{mmol}, 1$ equiv.) and methyl oxalyl chloride ( $1.8 \mathrm{~mL}, 20 \mathrm{mmol}, 2$ equiv.) were successively added and the mixture was allowed to stir at room temperature for 16 h . The reaction was quenched by addition of a saturated solution of $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ and the aqueous phase was extracted with diethyl ether $(3 \times 40 \mathrm{~mL})$. The organic phases were combined, dried over $\mathrm{MgSO}_{4}$, and the solvent was eliminated under reduced pressure. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 95:5) obtaining the pure desired product.

Methyl 2-oxo-4-phenylbut-3-ynoate (2a) ${ }^{244}$

The compound was prepared according to the general procedure, starting from phenylacetylene ( $1.1 \mathrm{~mL}, 10 \mathrm{mmol}$ ). Yellow solid. Yield: $61 \%$ ( $990 \mathrm{mg}, 6.1 \mathrm{mmol}$ ). All data were consistent with those previously reported. ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.72-7.64(\mathrm{~m}, 2 \mathrm{H}), 7.56-7.51$ (m, 1H), $7.45-7.40(\mathrm{~m}, 2 \mathrm{H}), 3.97(\mathrm{~s}, 3 \mathrm{H})$.

## Methyl 4-(4-fluorophenyl)-2-oxobut-3-ynoate (2b)

The compound was prepared according to the general procedure, starting from 1-ethynyl-1-fluorobenzene $(1.2 \mathrm{~mL}$, $10 \mathrm{mmol})$. Yellow solid. Yield: $50 \%$ ( $1.0 \mathrm{~g}, 5.0 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.74-7.65(\mathrm{~m}, 2 \mathrm{H}), 7.18-7.08$ (m, 2H), $3.96(\mathrm{~s}, 3 \mathrm{H})$.

[^92]
## Methyl 4-(3-chlorophenyl)-2-oxobut-3-ynoate (2c)

The compound was prepared according to the general procedure, starting from 3-chloro-1-ethynylbenzene ( $1.4 \mathrm{~g}, 10$ mmol ). Brown solid. Yield: $22 \%$ ( $500 \mathrm{mg}, 2.2 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.66(\mathrm{t}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.56(\mathrm{dt}, J$ $=7.6,1.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{ddd}, J=8.1,2.1,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.37(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.97(\mathrm{~s}$, $3 \mathrm{H})$.

## Methyl 4-(3-methylphenyl)-2-oxobut-3-ynoate (2d)

The compound was prepared according to the general procedure, starting from 1-ethynyl-3-methylbenzene $(1.2 \mathrm{~g}$, $10 \mathrm{mmol})$. Brown solid. Yield: $58 \%(1.2 \mathrm{mg}, 5.8 \mathrm{mmol}) .{ }^{1} \mathbf{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.49(\mathrm{dd}, J=6.4,1.4 \mathrm{~Hz}, 2 \mathrm{H})$, 7.32 (dd, $J=6.2,1.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), $3.96(\mathrm{~s}, 3 \mathrm{H}), 2.38(\mathrm{~s}, 3 \mathrm{H})$.

### 5.3.3. Cross-aldol reaction of $\alpha, \beta$-ynals

### 5.3.3.1. General procedure

To a solution of the amine catalyst $\mathbf{C 1}(47 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) in THF ( 0.5 mL ) at $-60^{\circ} \mathrm{C}$ were successively added 4 -pentenal ( $\mathbf{3 B}, 74 \mu \mathrm{~L}, 0.75 \mathrm{mmol}, 1.5$ equiv.), benzoic acid ( $12 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) and the corresponding ynal $1(0.5 \mathrm{mmol}, 1$ equiv.). The resulting solution was stirred at $-60^{\circ} \mathrm{C}$ for $24-48 \mathrm{~h}$ until the reaction stopped ( ${ }^{1} \mathrm{H}$ NMR monitoring), and to the mixture $\mathrm{MeOH}(4.5 \mathrm{~mL}$ ), trimethyl orthoformate ( $0.16 \mathrm{~mL}, 1.5 \mathrm{mmol}, 3$ equiv.) and $p \mathrm{TSA}(20 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) were successively added at $-60^{\circ} \mathrm{C}$. The mixture was allowed to reach $0^{\circ} \mathrm{C}$ and, after 2 h stirring, the reaction was quenched with saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ and extracted with ethyl acetate $(2 \times 4 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 90:10), thus allowing in each case separation of anti (major) and syn (minor) aldol diastereomers.

Racemic reactions were conducted following the procedure for the asymmetric version, but using $( \pm) \mathbf{1 C}(20 \mathrm{~mol} \%)$ as the catalyst.

### 5.3.3.2. Characterization data for compounds $\mathbf{5 B}$

## (3S,4R)-4-(Dimethoxymethyl)-1-phenylhept-6-en-1-yn-3-ol (5Ba)

The compound was obtained following the general procedure using ynal 1a ( $61 \mu \mathrm{~L}, 0.5 \mathrm{mmol}$ ). Yellow oil. The adduct was obtained in a $1: 8$ syn/anti ratio. Yield: $72 \%$ ( $93 \mathrm{mg}, 0.36 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{24}=-8.2^{\circ}\left(c=1.05,94 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}(300 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ) $\delta 7.51-7.31(\mathrm{~m}, 5 \mathrm{H}), 5.94(\mathrm{ddt}, J=17.2,10.1,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.27-5.07(\mathrm{~m}$, 2 H ), 4.80 (d, $J=5.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 4.64 (d, $J=4.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.50(\mathrm{~s}, 3 \mathrm{H}), 3.49(\mathrm{~s}, 3 \mathrm{H}), 2.55-$ 2.37 (m, 2H), 2.20 (ddd, $J=10.7,7.4,5.7 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $136.5,130.0,128.9,125.3,117.2,106.7,88.5,81.0,63.2,56.1,55.0,46.3,30.4$. MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{O}_{3}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 261.1446; found, 261.1440. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak AD-H, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 19.8 min (minor), 22.0 min (major)).

## (4R,5S)-4-(Dimethoxymethyl)dodec-1-en-6-yn-5-ol (5Bb)

The compound was obtained following the general procedure using ynal $\mathbf{1 b}$ ( $0.71 \mathrm{~mL}, 5.0 \mathrm{mmol})$. Yellow oil. The adduct was obtained in a 1:20 syn/anti ratio. Yield: $50 \%(640 \mathrm{mg}, 2.5 \mathrm{mmol})$. $[\alpha]_{\mathrm{D}}{ }^{24}=+13.4^{\circ}\left(c=1.00,99 \%\right.$ ee, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}-\mathbf{N M R}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 6.04-5.66(\mathrm{~m}, 1 \mathrm{H}), 5.30-4.99(\mathrm{~m}, 2 \mathrm{H}), 4.56(\mathrm{~d}, J=5.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.47(\mathrm{~s}$, $3 \mathrm{H}), 3.45$ (s, 3H) 2.38 (dd, $J=13.7,7.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), 2.27 (td, $J=7.0,2.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.09-$ $2.02(\mathrm{~m}, 1 \mathrm{H}), 1.55(\mathrm{dd}, J=14.0,7.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.46-1.35(\mathrm{~m}, 4 \mathrm{H}), 0.93(\mathrm{t}, J=7.1 \mathrm{~Hz}$, 3H). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.1,117.1,107.0,86.9,80.1,63.1,56.1,55.0$, 46.7, 31.4, 30.6, 28.7, 22.5, 19.1, 14.3. MS: calculated for $\mathrm{C}_{14} \mathrm{H}_{23} \mathrm{O}_{2}\left(\mathrm{M}-\mathrm{OMe}^{-}\right)$, 223.1704; found, 223.1696. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the corresponding $O$-benzoylate derivative (Daicel Chiralpak IC, hexane/isopropanol, 99:1; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 5.9 $\min$ (major), 8.2 min (minor)).

## (4R,5S)-4-(dimethoxymethyl)-9-methyldec-1-en-6-yn-5-ol (5Bc)

The compound was obtained following the general procedure using ynal $\mathbf{1 c}(0.71 \mathrm{~mL}, 5.0 \mathrm{mmol})$. Yellow oil. The adduct was obtained in a $1: 20$ syn/anti ratio. Yield: $50 \%$ ( $640 \mathrm{mg}, 2.5$ mmol). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{24}=+14.3^{\circ}\left(c=1.00,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.04-5.66(\mathrm{~m}, 1 \mathrm{H}), 5.30-4.99(\mathrm{~m}, 2 \mathrm{H}), 4.56(\mathrm{~d}, J=5.1 \mathrm{~Hz}, 2 \mathrm{H})$, 3.47 (s, 3H), 3.45 (s, 3H) 2.38 (dd, $J=13.7,7.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.27(\mathrm{td}, J=7.0,2.0 \mathrm{~Hz}, 2 \mathrm{H})$, $2.09-2.02(\mathrm{~m}, 1 \mathrm{H}), 1.55(\mathrm{dd}, J=14.0,7.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.46-1.35(\mathrm{~m}, 4 \mathrm{H}), 0.93(\mathrm{t}, J=$ $7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.1,117.1,107.0,86.9,80.1,63.1,56.1$, 55.0, 46.7, 31.4, 30.6, 28.7, 22.5, 19.1, 14.3. MS: calculated for $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{O}_{2}\left(\mathrm{M}-\mathrm{OMe}^{-}\right)$, 209.1547; found, 209.1523. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the corresponding $O$-benzoylate derivative (Daicel Chiralpak IC, hexane/isopropanol, $98: 2$; flux $=0.75 \mathrm{~mL} / \mathrm{min}$; retention times: 6.5 min (major), 7.5 min (minor)).

## (3S,4R)-4-(dimethoxymethyl)-1-(thiophen-3-yl)hept-6-en-1-yn-3-ol (5Bd)

The compound was obtained following the general procedure using ynal $\mathbf{1 d}$ ( $52 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). Yellow oil. The adduct was obtained in a $1: 9$ syn/anti ratio. Yield: $72 \%(96 \mathrm{mg}, 0.36$ $\mathrm{mmol}) \cdot[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{24}=+21.6^{\circ}\left(c=1.00,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.44(\mathrm{~s}, 1 \mathrm{H}), 7.26(\mathrm{~s}, 1 \mathrm{H}), 7.11(\mathrm{~d}, J=3.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.03-5.74(\mathrm{~m}$, $1 \mathrm{H}), 5.16$ (d, $J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.08(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.74(\mathrm{~s}, 1 \mathrm{H}), 4.58(\mathrm{~d}, J=4.7$ $\mathrm{Hz}, 1 \mathrm{H}), 3.46(\mathrm{~s}, 3 \mathrm{H}), 3.45(\mathrm{~s}, 3 \mathrm{H}), 2.48-2.33(\mathrm{~m}, 2 \mathrm{H}), 2.15-1.12(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.5,131.6,128.3,128.2,122.4,117.0,106.7,88.9,85.7,63.0$, 55.9, 54.8, 46.3, 30.3. MS: calculated for $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{O}_{2} \mathrm{~S}\left(\mathrm{M},-\mathrm{OMe}^{-}\right)$, 235.0798; found, 235.0784. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak AD-H, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 25.8 min (minor), 26.7 min (major)).
5.3.3.3. Benzoylation of adducts for ee determination by HPLC

The $e e$ of adducts $\mathbf{5 B b}$ and $\mathbf{5 B} \mathbf{c}$ was determined on their benzoylated derivative, prepared as follow. To a solution of alcohol $\mathbf{5 B}(0.15 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$
were successively added DMAP ( $55 \mathrm{mg}, 0.45 \mathrm{mmol}, 3$ equiv.) and benzoyl chloride ( 32 $\mathrm{mg}, 0.23 \mathrm{mmol}, 1.5$ equiv.). The resulting mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 3 h , diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and the organic solution was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(2 \times 5 \mathrm{~mL})$ and a saturated solution of $\mathrm{NaHCO}_{3}(2 \times 5 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude material was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 95:5) to afford the pure benzoylated product.

## (4R,5S)-4-(Dimethoxymethyl)dodec-1-en-6-yn-5-yl benzoate ( $5^{\prime} \mathbf{B b}$ )

The product was prepared as described above starting from adduct 5Bb ( $38 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.). Yellow oil. Yield: 95\% ( $51 \mathrm{mg}, 0.14 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ) $\delta 8.10$ $-8.03(\mathrm{~m}, 2 \mathrm{H}), 7.60-7.53(\mathrm{~m}, 1 \mathrm{H}), 7.47-7.41(\mathrm{~m}, 2 \mathrm{H}), 6.07$ $-5.92(\mathrm{~m}, 1 \mathrm{H}), 5.84(\mathrm{dd}, J=4.3,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.15-4.95(\mathrm{~m}, 3 \mathrm{H}), 4.43(\mathrm{~d}, J=7.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.41(\mathrm{~s}, 3 \mathrm{H}), 3.37(\mathrm{~s}, 4 \mathrm{H}), 2.56-2.41(\mathrm{~m}, 3 \mathrm{H}), 2.34-2.28(\mathrm{~m}, 1 \mathrm{H}), 2.23(\mathrm{ddd}, J=$ $7.1,4.5,2.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.55-1.48(\mathrm{~m}, 2 \mathrm{H}), 1.40-1.31(\mathrm{~m}, 4 \mathrm{H}), 0.92-0.86(\mathrm{~m}, 3 \mathrm{H})$.

## (4R,5S)-4-(Dimethoxymethyl)-9-methyldec-1-en-6-yn-5-yl benzoate ( $\mathbf{5}^{\prime} \mathbf{B c}$ )

The product was prepared as described above starting from adduct 5Bc ( $36 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.). Yellow oil. Yield: 95\% ( $51 \mathrm{mg}, 0.14 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $8.16-7.94(\mathrm{~m}, 2 \mathrm{H}), 7.61-7.52(\mathrm{~m}, 1 \mathrm{H}), 7.47-7.42$ (m, $2 \mathrm{H}), 6.10-5.90(\mathrm{~m}, 1 \mathrm{H}), 5.86$ (dt, $J=4.2,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.15-4.90(\mathrm{~m}, 2 \mathrm{H}), 4.44$ (d, $J$ $=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.41(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{~s}, 3 \mathrm{H}), 2.59-2.39(\mathrm{~m}, 2 \mathrm{H}), 2.37-2.27(\mathrm{~m}, 1 \mathrm{H}), 2.14$ (dd, $J=6.5,2.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.91-1.72(\mathrm{~m}, 1 \mathrm{H}), 0.98(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 6 \mathrm{H})$.

### 5.3.4. Cross-aldol reaction of $\alpha, \beta$-ynones

### 5.3.4.1. General procedure

$3 \mathrm{~A}, \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}$
2a, $R=P h$
3B, $\mathrm{R}=\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}$
2b, $\mathrm{R}=4-\mathrm{FC}_{6} \mathrm{H}_{4}$
3C, $\mathrm{R}=\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}$
2c, $R=3-\mathrm{ClC}_{6} \mathrm{H}_{4}$
3D, $\mathrm{R}=\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$
2d, $\mathrm{R}=3-\mathrm{MeC}_{6} \mathrm{H}_{4}$

To a solution of the amine catalyst $\mathbf{C 1}(47 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%)$, benzoic acid ( $12 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) and the corresponding ynone $2(0.5 \mathrm{mmol}, 1$ equiv.) in THF ( 0.5 mL ) at $-40^{\circ} \mathrm{C}$ the corresponding aldehyde 3 ( $0.75 \mathrm{mmol}, 1.5$ equiv.) was added. The resulting solution was stirred at $-40^{\circ} \mathrm{C}$ for 48 h until the reaction stopped ( ${ }^{1} \mathrm{H}$ NMR monitoring), and to the mixture $\mathrm{MeOH}(4.5 \mathrm{~mL})$, trimethyl orthoformate ( $0.16 \mathrm{~mL}, 1.5 \mathrm{mmol}, 3$ equiv.) and $p \mathrm{TSA}(20 \mathrm{mg}, 0.1 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) were successively added at $-60^{\circ} \mathrm{C}$. The mixture was allowed to reach $0^{\circ} \mathrm{C}$ and, after 2 h stirring, the reaction was quenched with saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ and extracted with ethyl acetate $(2 \times 4 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by flash column chromatography on silica gel (eluting with hexane/THF 92:8), thus allowing in each case separation of syn (major) and anti (minor) aldol diastereomers.

Racemic reactions were conducted following the procedure for the asymmetric version, but using $( \pm) \mathbf{1 C}(20 \mathrm{~mol} \%)$ as the catalyst.

### 5.3.4.2. Characterization data for compounds 9

## Methyl (R)-2-((R)-1,1-dimethoxy-3-phenylpropan-2-yl)-2-hydroxy-4-phenylbut-3ynoate (9Aa)

The compound was obtained following the general procedure from aldehyde 3A ( $97 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ) and ynone $\mathbf{2 a}(94 \mathrm{mg}, 0.5 \mathrm{mmol})$. White solid. The adduct was obtained in a $5: 1$ syn/anti ratio. m. p.: $123-127^{\circ} \mathrm{C}$. Yield: $83 \%(153 \mathrm{mg}, 0.42 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{25}=-69.5^{\circ}(c=$
1.00, $95 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.36-7.27$ (m, 6H), $7.22-7.13(\mathrm{~m}, 2 \mathrm{H}), 4.33(\mathrm{~d}, J=6.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.52(\mathrm{~s}, 1 \mathrm{H}), 3.41$ (dd, $J=7.4,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 3.10(\mathrm{~s}, 3 \mathrm{H}), 2.93(\mathrm{dd}, J=14.4,7.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.89$ - $2.81(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 172.6,140.8,132.0,131.9,129.2$, 129.2, 129.1, 128.7, 128.6, 128.5, 128.2, 128.2, 125.9, 106.2, 87.7, 85.9, 73.6, 56.7, 53.5, 53.2, 50.1, 33.3. MS: calculated for $\mathrm{C}_{20} \mathrm{H}_{17} \mathrm{O}_{3}\left(\mathrm{M}-(\mathrm{OMe})_{2}{ }^{-}\right)$, 305.1178; found, 305.1189. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA, hexane/isopropanol, 95:5; flux $=0.5 \mathrm{~mL} / \mathrm{min}$; retention times: 20.2 min (major), 27.5 min (minor)).

## Methyl (2R,3R)-3-(dimethoxymethyl)-2-hydroxy-2-(phenylethynyl)hex-5-enoate (9Ba)

The compound was obtained following the general procedure from aldehyde 3B ( $74 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ) and ynone $\mathbf{2 a}(94 \mathrm{mg}, 0.5 \mathrm{mmol})$. Colourless oil. The adduct was obtained in a $6: 1$ syn/anti ratio. Yield: $74 \%(117 \mathrm{mg}, 0.37 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{25}=-83.0^{\circ}(c=1.00,94 \%$ $e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.50-7.40(\mathrm{~m}, 2 \mathrm{H}), 7.37-7.22(\mathrm{~m}, 3 \mathrm{H})$, $6.05(\mathrm{td}, J=10.1,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.17-4.96(\mathrm{~m}, 2 \mathrm{H}), 4.42(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{~s}$, $1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 2.77-2.66(\mathrm{~m}, 1 \mathrm{H}), 2.62-2.50(\mathrm{~m}, 2 \mathrm{H})$. ${ }^{13} \mathbf{C - N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 173.1,137.5,132.3,129.1,128.7,122.5,116.4,106.3$, 87.8, 86.1, 73.7, 57.4, 54.2, 53.8, 48.6, 32.2. MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{O}_{3}\left(\mathrm{M}-(\mathrm{OMe})_{2}{ }^{-}\right.$ ), 255.1021; found, 255.1039. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, $98: 2$; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 11.6 min (major), 13.1 min (minor)).

## Methyl (2R,3R)-3-(dimethoxymethyl)-2-((4-fluorophenyl)ethynyl)-2-hydroxyhex-5enoate ( 9 Bb )

The compound was obtained following the general procedure from aldehyde 3B ( $74 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ) and ynone 2b ( $102 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). Colourless oil. The adduct was obtained in a $8: 1$ syn/anti ratio. Yield: $77 \%$ ( $129 \mathrm{mg}, 0.39$ mmol). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{21}=-80.9^{\circ}\left(c=1.00,93 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41$ (dd, $J=8.9,5.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.99(\mathrm{t}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.15-5.90(\mathrm{~m}, 1 \mathrm{H}), 5.15-4.99(\mathrm{~m}$, $2 \mathrm{H}), 4.39(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{~s}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 2.76$ - $2.64(\mathrm{~m}, 1 \mathrm{H}), 2.62-2.44(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathbf{C}$-NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 172.6,164.4,161.1$, 137.0, 133.8, 133.7, 115.9, 115.7, 115.4, 105.8, 87.1, 84.6, 73.2, 56.9, 53.8, 53.3, 48.1, 31.7. MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{FO}_{3}\left(\mathrm{M}-(\mathrm{OMe})_{2}^{-}\right)$, 273.0927; found, 273.0916. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the
crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 95:5; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 7.3 min (major), 8.0 min (minor)).

## Methyl (2R,3R)-2-((3-chlorophenyl)ethynyl)-3-(dimethoxymethyl)-2-hydroxyhex-5enoate (9Bc)

The compound was obtained following the general procedure from aldehyde $\mathbf{3 B}(74 \mu \mathrm{~L}, 0.75 \mathrm{mmol})$ and ynone 2c ( $111 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). Colourless oil. The adduct was obtained in a $5: 1$ syn/anti ratio. Yield: $65 \%(115 \mathrm{mg}, 0.33$ mmol). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{21}=-18.3^{\circ}\left(c=1.00,94 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.42$ $(\mathrm{t}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.34-7.28(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.20(\mathrm{~m}, 1 \mathrm{H}), 6.02(\mathrm{td}, J=10.1,5.0 \mathrm{~Hz}$, $1 \mathrm{H}), 5.16-4.97(\mathrm{~m}, 2 \mathrm{H}), 4.40(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{~s}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 3.37(\mathrm{~s}$, 3H), $3.35(\mathrm{~s}, 3 \mathrm{H}), 2.74-2.65(\mathrm{~m}, 1 \mathrm{H}), 2.62-2.48(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 172.5,136.9,134.1,131.7,130.0,129.5,129.0,125.5,116.1,105.8,88.6$, 84.2, 73.2, 57.0, 53.8, 53.4, 48.1, 31.8. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA, hexane/isopropanol, $95: 5$; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 6.7 min (major), 8.0 min (minor)).

## Methyl (2R,3R)-3-(dimethoxymethyl)-2-hydroxy-2-(phenylethynyl)hexaneate (9Ca)

The compound was obtained following the general procedure from aldehyde 3C ( $74 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ) and ynone $\mathbf{2 a}(94 \mathrm{mg}, 0.5 \mathrm{mmol})$. Colourless oil. The adduct was obtained in a $8: 1$ syn/anti ratio. Yield: $65 \%(120 \mathrm{mg}, 0.36 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{21}=-21.0^{\circ}(c=1.00,93 \%$ $e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.45-7.40(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.27(\mathrm{~m}, 3 \mathrm{H})$, 4.39 (d, $J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.01(\mathrm{~d}, J=0.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 3.37(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{~s}$, $3 \mathrm{H}), 2.45(\mathrm{dt}, J=7.3,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.89(\mathrm{ddd}, J=11.9,8.4,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.73-1.50(\mathrm{~m}$, $3 \mathrm{H}), 0.96(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 173.4,132.2,129.0,128.6$, 125.9, 122.6, 107.0, 88.1, 85.5, 73.9, 58.7 - 57.4, 54.3, 53.7, 48.5, 30.7, 30.0, 22.1, 15.0. MS: calculated for $\mathrm{C}_{17} \mathrm{H}_{21} \mathrm{O}_{4}\left(\mathrm{M}-\mathrm{OMe}^{-}\right)$, 289.1434; found, 289.1427. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA+IC, hexane/isopropanol, 95:5; flux $=0.5$ $\mathrm{mL} / \mathrm{min}$; retention times: 29.7 min (major), 34.6 min (minor)).

## Methyl <br> (2R,3R)-3-(dimethoxymethyl)-2-hydroxy-4-methyl-2(phenylethynyl)pentanoate (9Da)

The compound was obtained following the general procedure from aldehyde 3D ( $74 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ) and ynone $\mathbf{2 a}(94 \mathrm{mg}, 0.5 \mathrm{mmol})$. Colourless oil. The adduct was obtained in a $5: 1$ syn/anti ratio. Yield: $70 \%(112 \mathrm{mg}, 0.35 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{22}=-33.4^{\circ}(c=1.00,95 \%$ $e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.46-7.40(\mathrm{~m}, 2 \mathrm{H}), 7.33-7.26(\mathrm{~m}, 3 \mathrm{H})$, 4.52 (d, $J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.98(\mathrm{~d}, J=0.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{~s}$, $3 \mathrm{H}), 2.68-2.56(\mathrm{~m}, 1 \mathrm{H}), 2.47-2.40(\mathrm{~m}, 1 \mathrm{H}), 1.16(\mathrm{dd}, J=7.1,3.2 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 173.3,131.7,129.0,128.6,128.2,128.2,105.2,88.1,85.7,74.2$, 57.1, 53.3, 53.2, 51.6, 27.7, 23.2, 19.1. MS: calculated for $\left.\mathrm{C}_{16} \mathrm{H}_{17} \mathrm{O}_{3}\left(\mathrm{M}-(\mathrm{OMe})_{2}\right)^{-}\right)$, 257.11782; found, 257.1216. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 9.2 min (major), 11.2 min (minor)).

### 5.3.5. Elaboration of adducts 5 and 9

### 5.3.5.1. Silylation of adducts

## General procedure for the silylation of adducts 5

To a solution of alcohol $5(0.5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ at $-10{ }^{\circ} \mathrm{C}$ were successively added DIPEA ( $194 \mathrm{mg}, 1.5 \mathrm{mmol}, 3$ equiv.) and triisopropylsilyl trifluoromethanesulfonate ( $184 \mathrm{mg}, 0.6 \mathrm{mmol}, 1.2$ equiv.). The resulting mixture was stirred at $-10{ }^{\circ} \mathrm{C}$ for 1 h , diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$, and the organic solution was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(2 \times 10 \mathrm{~mL})$ and saturated $\mathrm{NHCO}_{3}(2 \times 10$ $\mathrm{mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 95:5) to afford the pure silyl ether compound as a yellow oil.
(((3R,4R)-4-(Dimethoxymethyl)-1-phenylhept-6-en-1-yn-3-yl)oxy)triisopropylsilane (6a)

The compound was prepared as described above from adduct $\mathbf{5 a}$ ( $130 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). Yield: $72 \%$ ( $150 \mathrm{mg}, 0.36 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.45-7.42(\mathrm{~m}, 2 \mathrm{H}), 7.35-7.33(\mathrm{~m}, 3 \mathrm{H})$, $6.24-5.97(\mathrm{~m}, 1 \mathrm{H}), 5.16-5.04(\mathrm{~m}, 1 \mathrm{H}), 5.04-4.96(\mathrm{~m}, 1 \mathrm{H})$, $4.94(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.43(\mathrm{~s}, 3 \mathrm{H}), 3.40(\mathrm{~s}, 3 \mathrm{H}), 2.57(\mathrm{dt}, J$ $=15.7,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.39(\mathrm{dt}, J=14.5,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.19(\mathrm{dt}, J=13.0,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.23$ $-1.11(\mathrm{~m}, 21 \mathrm{H})$.
(((4R,5R)-4-(dimethoxymethyl)-9-methyldec-1-en-6-yn-5-yl)oxy)triisopropylsilane (6c)

The compound was prepared as described above from adduct $\mathbf{5 c}$ ( $120 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). Yield: $68 \%$ ( $135 \mathrm{mg}, 0.34 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.14-6.00(\mathrm{~m}, 1 \mathrm{H}), 5.05(\mathrm{dd}, J=$ $17.1,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.99-4.87(\mathrm{~m}, 1 \mathrm{H}), 4.38(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H})$, $3.39(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 2.68-2.43(\mathrm{~m}, 1 \mathrm{H}), 2.36-2.21(\mathrm{~m}, 1 \mathrm{H}), 2.14(\mathrm{~d}, J=2.0 \mathrm{~Hz}$, $1 \mathrm{H}), 2.12(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.10-2.04(\mathrm{~m}, 1 \mathrm{H}), 3.15-3.10(\mathrm{~m}, 21 \mathrm{H}), 1.01(\mathrm{~d}, J=$ 6.6 Hz, 6H).

## (((3R,4R)-4-(Dimethoxymethyl)-1-(thiophen-3-yl)hept-6-en-1-yn-3yl)oxy)triisopropylsilane (6d)

The compound was prepared as described above from adduct $\mathbf{5 d}$ $(133 \mathrm{mg}, 0.5 \mathrm{mmol})$. Yield: $70 \%$ ( $144 \mathrm{mg}, 0.35 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.45-7.42(\mathrm{~m}, 2 \mathrm{H}), 7.35-7.33(\mathrm{~m}$, $3 \mathrm{H}), 6.24-5.97(\mathrm{~m}, 1 \mathrm{H}), 5.16-5.04(\mathrm{~m}, 1 \mathrm{H}), 5.04-4.96(\mathrm{~m}$, $1 \mathrm{H}), 4.94(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.43(\mathrm{~s}, 3 \mathrm{H}), 3.40(\mathrm{~s}, 3 \mathrm{H}), 2.57$ (dt, $J=15.7,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.39(\mathrm{dt}, J=14.5,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.19(\mathrm{dt}, J=13.0,5.5 \mathrm{~Hz}$, $1 \mathrm{H}), 1.23-1.11(\mathrm{~m}, 21 \mathrm{H})$.

## Silylation of adduct 9Aa

To a solution of tertiary alcohol 9Aa ( $159 \mathrm{mg}, 0.5 \mathrm{mmol}$, 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (2 mL ) at $-10{ }^{\circ} \mathrm{C}$ were successively added DMAP ( $6.1 \mathrm{mg}, 0.05 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ), TEA ( $0.2 \mathrm{~mL}, 1.5 \mathrm{mmol}, 3$ equiv.) and trimethylchlorosilane ( $134 \mu \mathrm{~L}, 1 \mathrm{mmol}, 2$ equiv.). The resulting mixture was stirred at room temperature for 1 h , diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$, and the organic solution was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(2 \times 10 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3}(2 \times 10 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude product was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 95:5) to afford the pure silyl ether compound as a yellow oil. Yield: Cuantitative ( $195 \mathrm{mg}, 0.5 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.48$ $-7.44(\mathrm{~m}, 2 \mathrm{H}), 7.39-7.33(\mathrm{~m}, 3 \mathrm{H}), 6.09(\mathrm{ddd}, J=13.9,10.1,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.17-4.95$ $(\mathrm{m}, 2 \mathrm{H}), 4.38(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.79(\mathrm{~s}, 3 \mathrm{H}), 3.37(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{~s}, 3 \mathrm{H}), 2.73-2.55$ $(\mathrm{m}, 2 \mathrm{H}), 2.53-2.42(\mathrm{~m}, 1 \mathrm{H}), 0.30(\mathrm{~s}, 9 \mathrm{H})$.

### 5.3.5.2. Intramolecular Pauson-Khand reaction

## Intramolecular Pauson-Khand reaction of compounds 6

$\left[\mathrm{Co}_{2}(\mathrm{CO})_{8}\right]$ ( $341 \mathrm{mg}, 1 \mathrm{mmol}, 2$ equiv.) was added to a solution of the corresponding sylilated propargylic alcohol $\mathbf{6}$ ( 0.5 mmol , 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ at room temperature and was stirred for 30 min . Then trimethylamine $N$-oxide (TMANO) ( $226 \mathrm{mg}, 3 \mathrm{mmol}, 6$ equiv.) was added at $-10^{\circ} \mathrm{C}$ and the mixture was allowed to warm to room temperature until the initially formed Co complex disappeared ( 16 h ), at which time usually a purple precipitate had formed. The mixture was passed through a small plug of silica gel and the filtrate was concentrated in vacuo. The residue was purified by flash column chromatography on silica gel eluting with hexane/EtOAc 95:5, affording the desired bicyclic compound as a yellow oil.

## (4S,5R,6aR)-5-(dimethoxymethyl)-3-phenyl-4-((triisopropylsilyl)oxy)-4,5,6,6a-tetrahydropentalen-2(1H)-one (7a)

7a

The compound was obtained following the general procedure from silylated propargylic alcohol $\mathbf{6 a}(208 \mathrm{mg}, 0.5 \mathrm{mmol})$. Yellow oil. The adduct was obtained in a $>20: 1 \mathrm{dr}$. Yield: $65 \% ~(144 \mathrm{mg}, 0.33$ mmol). ${ }^{\mathbf{1}} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41-7.29(\mathrm{~m}, 5 \mathrm{H}), 5.06$ $(\mathrm{s}, 1 \mathrm{H}), 4.09(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 2.85(\mathrm{dd}, J=18.3,6.6 \mathrm{~Hz}$, $1 \mathrm{H}), 2.70(\mathrm{dd}, J=14.4,6.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.40(\mathrm{dt}, J=12.9,9.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.24$ (dd, $J=18.4$, $2.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.23-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.97-0.89(\mathrm{~m}, 21 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 209.2, 180.2, 134.2, 131.4, 128.4, 128.2, 127.9, 106.2, 69.6, 54.9, 53.8, 53.2, 42.7, 39.0, 30.1, 17.8, 17.8, 12.2. MS: calculated for $\mathrm{C}_{26} \mathrm{H}_{40} \mathrm{O}_{4} \mathrm{Si}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 445.2774; found: 445.2726.
(4S,5R,6aR)-5-(dimethoxymethyl)-3-isobutyl-4-((triisopropylsilyl)oxy)-4,5,6,6a-tetrahydropentalen-2(1H)-one (7c)

7c

The compound was obtained following the general procedure from silylated propargylic alcohol $\mathbf{6 c}(127 \mathrm{mg}, 0.32 \mathrm{mmol})$. Yellow oil. The adduct was obtained in a $>20: 1 \mathrm{dr}$. Yield: $64 \%$ ( $87 \mathrm{mg}, 0.32$ mmol). ${ }^{\mathbf{1}} \mathbf{H}$-NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.82(\mathrm{~s}, 1 \mathrm{H}), 4.01$ (d, $J=$ $7.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.34 (s, 3H), 3.29 (s, 3H), 2.67 (dd, $J=18.3,6.4 \mathrm{~Hz}$,

2H), 2.36 - 2.27 (m, 1H), $2.26-2.18(\mathrm{~m}, 1 \mathrm{H}), 2.11-2.01(\mathrm{~m}, 1 \mathrm{H}), 1.97$ (d, $J=13.1$ $\mathrm{Hz}, 1 \mathrm{H}), 1.91-1.81(\mathrm{~m}, 1 \mathrm{H}), 1.09-1.02(\mathrm{~m}, 21 \mathrm{H}), 1.00-0.92(\mathrm{~m}, 2 \mathrm{H}), 0.88(\mathrm{~d}, J=$ $6.5 \mathrm{~Hz}, 3 \mathrm{H}), 0.80(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.5,179.2$, 134.7, 105.9, 69.8, 54.5, 53.7, 52.9, 42.4, 39.4, 33.1, 30.8, 27.1, 22.9, 22.4, 18.0, 18.0, 12.5. ## (4S,5R,6aR)-5-(dimethoxymethyl)-3-(thiophen-3-yl)-4-((triisopropylsilyl)oxy)-4,5,6,6a-tetrahydropentalen-2(1H)-one (7d)

The compound was obtained following the general procedure from silylated propargylic alcohol $\mathbf{6 d}(76 \mathrm{mg}, 0.18 \mathrm{mmol})$. Yellow oil. The adduct was obtained in a $>20: 1 d r$. Yield: $65 \% ~(52 \mathrm{mg}, 0.33$ mmol). ${ }^{\mathbf{1}} \mathbf{H}$-NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $7.70-7.65$ (m, 1H), $7.35-$ 7.28 (m, 2H), 5.16 (s, 1H), 4.04 (d, $J=6.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.33 ( $\mathrm{s}, 3 \mathrm{H}$ ), 3.32 (s, 3H), 2.83 (dd, $J=18.3,6.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.70(\mathrm{dd}, J=14.8,6.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.46-2.33$ $(\mathrm{m}, 1 \mathrm{H}), 2.21(\mathrm{dd}, J=18.3,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.23-1.10(\mathrm{~m}, 1 \mathrm{H}), 1.03-0.90(\mathrm{~m}, 21 \mathrm{H})$. ${ }^{13}$ C-NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 209.2,178.5,127.0,125.2,124.3,106.2,70.1,54.9$, 53.8, 53.2, 42.8, 39.0, 30.1, 17.9, 17.8, 12.3. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{38} \mathrm{O}_{4} \mathrm{SSi}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 452.338; found: 451.2318.

## Intramolecular Pauson-Khand reaction of compound 11

The intramolecular Pauson-Khand reaction of compound $\mathbf{1 1}$ ( $195 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) was conducted following the procedure described above for secondary silylated propargylic alcohols 6, obtaining the bicyclic product as a 1.5:1 mixture of diastereomers. Combined yield: $53 \%$ ( $97 \mathrm{mg}, 0.27 \mathrm{mmol}$ ). Data of major isomer: ${ }^{1} \mathbf{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.37 (ddd, $J=8.7,7.8,6.1 \mathrm{~Hz}, 3 \mathrm{H}$ ), $7.26-7.16$ (m, 2H), 4.54 (d, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.54-3.43(\mathrm{~m}, 1 \mathrm{H}), 3.30(\mathrm{~s}, 3 \mathrm{H}), 3.30(\mathrm{~s}, 3 \mathrm{H}), 3.07-2.89(\mathrm{~m}, 2 \mathrm{H})$, $2.86(\mathrm{~s}, 3 \mathrm{H}), 2.36(\mathrm{dd}, J=18.0,3.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.16(\mathrm{ddd}, J=13.4,11.4,9.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.72$ (ddd, $J=13.7,10.2,5.3 \mathrm{~Hz}, 1 \mathrm{H}), 0.32(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 208.5$, $177.5,171.1,135.1,130.3,129.2,128.2,128.0,104.8,80.9,55.5,53.4,52.0,51.2,44.7$, 39.8, 29.0, 2.5. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{O}_{4} \mathrm{Si}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 419.1890; found, 419.1869.

### 5.3.5.3. Hydrolysis of the acetal 7a

To a solution of the acetal $7 \mathbf{7 a}(355 \mathrm{mg}, 0.80 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL}) 7.4 \mathrm{wt} \%$ $\mathrm{FeCl}_{3}$ on $\mathrm{SiO}_{2}(80 \mathrm{mg})$ was added, and the resulting suspension was stirred vigorously for 1 h . Then aqueous $\mathrm{NaHCO}_{3}(1 \mathrm{~mL})$ was added, and the organic phase was washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. Flash column chromatography on silica gel (hexane/EtOAc 95:5) of the residue afforded the pure aldehyde $\mathbf{8}$ (yellow oil; $65 \%$, $206 \mathrm{mg}, 0.52 \mathrm{mmol}$ ) along with unreacted starting material $7 \mathrm{a}(15 \%, 54 \mathrm{mg}, 0.12$ mmol ). Effective yield of isolated $\mathbf{8}$ based on recovered starting material: $80 \% .{ }^{1} \mathbf{H}-$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $9.74(\mathrm{~d}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.44-7.30(\mathrm{~m}, 5 \mathrm{H}), 5.42(\mathrm{~s}, 1 \mathrm{H})$, 3.45 (ddd, $J=16.2,9.4,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.39-3.30(\mathrm{~m}, 1 \mathrm{H}), 2.90(\mathrm{dd}, J=18.4,6.6 \mathrm{~Hz}$, $1 \mathrm{H}), 2.60(\mathrm{dt}, J=12.8,9.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.30(\mathrm{dd}, J=18.4,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.51$ (ddd, $J=12.9$, $9.8,7.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.07-0.84(\mathrm{~m}, 21 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 208.3,199.6$, 177.2, 135.7, 130.7, 128.6, 128.4, 128.3, 68.0, 62.9, 42.6, 39.3, 29.3, 18.0, 17.9, 12.3. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{35} \mathrm{O}_{3} \mathrm{Si}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 399.2355; found, 399.2328.

### 5.3.5.4. Reduction of adducts 9Ba and 9Ca

To a solution of 9Ba or $9 \mathrm{Ca}(0.2 \mathrm{mmol})$ in $\mathrm{EtOH}(0.8 \mathrm{~mL}) \mathrm{Pd} 10 \% \mathrm{wt}$. on activated carbon ( $20 \mathrm{wt} \%$ ) was added. The mixture was allowed to stir under hydrogen atmosphere ( 1 atm ) for 16 h . The mixture was then filtered over celite ( 2 cm ) and the solvent was eliminated under reduced pressure yielding the desired product $\mathbf{1 0}$ as colourless oil. Yield: $76 \%$ ( $49 \mathrm{mg}, 0.15 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $7.31-$ $7.24(\mathrm{~m}, 2 \mathrm{H}), 7.23-7.14(\mathrm{~m}, 3 \mathrm{H}), 4.28(\mathrm{~d}, J=5.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.73(\mathrm{~d}, J=$ $0.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 2.76(\mathrm{td}, J=12.8,4.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.35-2.20(\mathrm{~m}$, $1 \mathrm{H}), 2.15-2.01(\mathrm{~m}, 2 \mathrm{H}), 1.99-1.85(\mathrm{~m}, 1 \mathrm{H}), 1.60-1.43(\mathrm{~m}, 3 \mathrm{H}), 1.41-1.25(\mathrm{~m}$, $1 \mathrm{H}), 0.89(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 176.9,141.82,128.43$
128.4, 125.9, 78.3, 56.7, 54.63, 52.2, 47.6, 39.4, 29.7, 27.4, 22.2, 14.6. MS: calculated for $\mathrm{C}_{17} \mathrm{H}_{25} \mathrm{O}_{4} \mathrm{Si}\left(\mathrm{M}-\mathrm{OMe}^{-}\right), 293.1753$; found, 293.1768.

### 5.3.6. ORTEP diagram of compound 9Aa

CCDC-930356 contains the supplementary crystallographic data for the structural analysis of 9Aa. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

### 5.4. Experimental section of Chapter 3

### 5.4.1. General procedures for the synthesis of $\alpha^{\prime}$ 'oxy enones

### 5.4.1.1. Preparation of $\alpha$ '-oxy enones $\mathbf{1 3}$

## Preparation of $\boldsymbol{\alpha}$ '-hydroxy enone 13a

Known enone 13a was prepared according to either of the following previously described procedures:

Method A: ${ }^{245}$ To a solution of methoxypropadiene ( $3.50 \mathrm{~g}, 50 \mathrm{mmol}$ ) in dry $\mathrm{Et}_{2} \mathrm{O}(100$ mL ) at $-40^{\circ} \mathrm{C}$, $n \mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $22 \mathrm{~mL}, 55 \mathrm{mmol}$ ) was added under nitrogen and the reaction mixture was stirred at $-40^{\circ} \mathrm{C}$ for 10 min . Then, acetone ( $4.04 \mathrm{~mL}, 55$ $\mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(55 \mathrm{~mL})$ was added within 5 min . The reaction mixture was stirred at the same temperature for 0.5 h and quenched with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$. The resulting mixture was allowed to warm to room temperature and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 100 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to afford 2-methyl-3-methoxy-3,4-pentadien-2-ol as a yellow liquid, which was added dropwise to $5 \%$ aq $\mathrm{H}_{2} \mathrm{SO}_{4}(110 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ and the mixture was stirred for 1.5 h . After this time, the reaction was allowed to warm to room temperature and the solution was saturated with solid NaCl . The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \times 60 \mathrm{~mL})$ and the combined extracts were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed to give a yellow oil which upon distillation afforded the enone as a colorless liquid. Yield: $88 \%$ ( $4.42 \mathrm{~g}, 38.7 \mathrm{mmol}$ ). All data were consistent with those previously reported. b.p. $=45{ }^{\circ} \mathrm{C}(13 \mathrm{mmHg}) .{ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 6.73(\mathrm{dd}, J=9.5,16.8 \mathrm{~Hz}, 1 \mathrm{H})$, $6.50(\mathrm{dd}, J=2.2,16.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.82(\mathrm{dd}, J=2.2,10.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.38(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 202.3,131.1,128.8,75.4,26.1$.

[^93]Method B: ${ }^{246}$ Commercially available 3-hydroxy-3-methyl-2-butanone (1 equiv., 5.3 $\mathrm{mL}, 50 \mathrm{mmol}$ ) and paraformaldehyde ( 2 equiv., $3 \mathrm{~g}, 100 \mathrm{mmol}$ ) were added to a solution of ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}$ ( 2 equiv., $14.0 \mathrm{~mL}, 100 \mathrm{mmol}$ ) and TFA ( 2.5 equiv., $9.6 \mathrm{~mL}, 125$ mmol ) in THF ( 250 mL ). The mixture was refluxed and paraformaldehyde (2 equiv., 3 $\mathrm{g}, 100 \mathrm{mmol}$ ) was added every 2 h three times. The mixture was stirred at reflux overnight and then was cooled to room temperature. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ was added and the mixture was washed with $1 \mathrm{~N} \mathrm{HCl}(75 \mathrm{~mL}), 1 \mathrm{~N} \mathrm{NaOH}(75 \mathrm{~mL})$ and brine ( 75 mL ), and the organic layer was dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure ( $230 \mathrm{mbar} /$ bath $40{ }^{\circ} \mathrm{C}$ ). The residue was purified by flash column chromatography on silica gel (eluent: diethyl ether) to afford 4-hydroxy-4-methylpent-1-en-3-one as colorless oil. Yield: $89 \%$ ( $5.0 \mathrm{~g}, 44.5 \mathrm{mmol}$ ).

## Preparation of $\boldsymbol{\alpha}$ '-trimethylsilyloxy enone $\mathbf{1 3} \mathbf{b}^{247}$

3-(Trimethylsilyl)-2-oxazolidinone (TMSO) ( $3.4 \mathrm{~mL}, 22.5 \mathrm{mmol}, 1.5$ equiv.) and 3 drops of trifluoromethanesulfonic acid were added to enone 13a ( $1.68 \mathrm{~g}, 15$ mmol, 1.5 equiv.). The reaction mixture was stirred at room temperature for 2 h , diluted with pentane $(20 \mathrm{~mL})$ and subsequently washed with water $(20 \mathrm{~mL})$ and $\mathrm{NaHCO}_{3}$ sat. ( 20 mL ). The organic phase was then dried over with $\mathrm{MgSO}_{4}$ and concentred under reduced pressure to afford the title compound 13b as a colorless oil. Yield: $93 \%$ ( 2.6 g , $14.0 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.03(\mathrm{dd}, J=17.3,10.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.38(\mathrm{dd}, J$ $=17.3,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{dd}, J=10.4,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.37(\mathrm{~s}, 6 \mathrm{H}), 0.14(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 202.8,130.7,129.2,79.3,27.2,2.3$.

## Preparation of $\alpha$ '-triethylsilyloxy enone 13c

The title compound 13c was prepared according to the following synthetic sequence:

[^94]
$1^{\text {st }}$ step: ${ }^{248}$ Methyl 2-hydroxyisobutyrate ( $6.9 \mathrm{~mL}, 60 \mathrm{mmol}, 1.2$ equiv.) was added under a nitrogen atmosphere to a solution of dimethyl amino pyridine ( $1.22 \mathrm{~g}, 10 \mathrm{mmol}$, 0.2 equiv.), triethylamine ( $10 \mathrm{~mL}, 50 \mathrm{mmol}, 1$ equiv.) and triethylchlorosilane ( 6.7 mL , $50 \mathrm{mmol}, 1$ equiv.) in 50 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The reaction mixture was stirred at room temperature for 24 hours. After filtering over celite to remove the salt, the filtrate was diluted with diethyl ether $(150 \mathrm{~mL})$ and the resulting solution was washed with brine (1 x 50 mL ) and water ( $1 \times 50 \mathrm{~mL}$ ). The solvent was removed under reduced pressure to give the corresponding triethylsilyl ether, which was used as such without further purification. Dimethyl methyl phosphonate ( $13.8 \mathrm{~mL}, 130 \mathrm{mmol}, 2.5$ equiv.) in dry THF $(40 \mathrm{~mL})$ was added dropwise to a cold solution of $n \mathrm{BuLi}(1.6 \mathrm{M}$ in hexanes, $79 \mathrm{~mL}, 130$ mmol, 2.5 equiv.) in dry THF ( 80 mL ) at $-78^{\circ} \mathrm{C}$ under a nitrogen atmosphere. After 30 min of stirring at the same temperature, a solution of the crude triethylsilyl ether $(16 \mathrm{~g}$, $50 \mathrm{mmol}, 1$ equiv.) in dry THF ( 100 mL ) was added dropwise at $-78^{\circ} \mathrm{C}$. The mixture was stirred at the same temperature $\left(-78{ }^{\circ} \mathrm{C}\right)$ for 3 h and then quenched at this temperature with a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 200 mL ). The reaction mixture was allowed to reach room temperature, it was extracted with diethyl ether ( $3 \times 250 \mathrm{~mL}$ ) and dried over $\mathrm{MgSO}_{4}$. The solvent was then evaporated under reduced pressure to get phosphonic acid dimethyl ester, which was used for the next step without further purification. Yield: $99 \%,(16.0 \mathrm{~g}, 49.5 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.79(\mathrm{~d}, J$ $=11.2 \mathrm{~Hz}, 6 \mathrm{H}), 3.39(\mathrm{~d}, J=20.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.36(\mathrm{~s}, 6 \mathrm{H}), 1.05-0.86(\mathrm{~m}, 9 \mathrm{H}), 0.74-0.56$ (m, 6H).
$\mathbf{2}^{\text {nd }}$ step: Dried $\mathrm{LiCl}\left(1.17 \mathrm{~g}, 27 \mathrm{mmol}, 1\right.$ equiv.) and $\mathrm{Et}_{3} \mathrm{~N}$ ( $3.8 \mathrm{~mL}, 27 \mathrm{mmol}, 1$ equiv.) were added successively to a solution of (3-methyl-2-oxo-3triethylsilyloxybutyl)phosphonic acid dimethyl ester ( $8.7 \mathrm{~g}, 27 \mathrm{mmol}$ ) in dry $\mathrm{MeCN}(67$ mL ). The resulting milky suspension was stirred for 15 min at room temperature and the formaldehyde ( $37 \%$ in water; 5.4 mL , $54 \mathrm{mmol}, 2$ equiv.) was added dropwise. The mixture was stirred for 40 h , diluted with water and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. to afford the crude product that was purified by flash silica gel chromatography (hexane/EtOAc, 95:5). ${ }^{\mathbf{1}} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.07(\mathrm{dd}, J=17.3,10.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.37(\mathrm{dd}, J=17.4,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.71$ (dd, $J=10.4,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.36(\mathrm{~s}, 6 \mathrm{H}), 1.06-0.85(\mathrm{~m}, 9 \mathrm{H}), 0.71-0.53(\mathrm{~m}, 6 \mathrm{H})$.

[^95]
### 5.4.1.2. Preparation of $\beta$-substituted $\alpha$ '-hydroxy enones 14

## Preparation of $\boldsymbol{\beta}$-aryl substituted $\alpha^{\prime}$ 'hydroxy enones 14a-14d

Enones $\mathbf{1 4 a} \mathbf{- 1 4 d}$ were synthesised following the procedure previously described in our group: ${ }^{249}$

3-Hydroxy-3-methyl-2-butanone ( $5.0 \mathrm{~g}, 30 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of $\mathrm{MeOH}(90 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$. Freshly distilled aldehyde ( $60 \mathrm{mmol}, 2$ equiv.) was then added followed by $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}(5.0 \mathrm{~g}, 120 \mathrm{mmol}, 4$ equiv.). The reaction mixtue was stirred at reflux for 3 h , and after removal of MeOH under reduced pressure, the aqueous residue was diluted with $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 50 \mathrm{~mL}$ ). The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extracts were combined, dried over $\mathrm{MgSO}_{4}$ and concentrated, and the crude product was purified by column chromatography (silca gel, hexane/EtOAc 90:10).

## (E)-4-hydroxy-4-methyl-1-(p-tolyl)pent-1-en-3-one (14a)

The title compound $\mathbf{1 4 a}$ was prepared using 4-
14a methylbenzaldehyde ( $3.4 \mathrm{~mL}, 60 \mathrm{mmol}, 2$ equiv.) according to the general procedure. Yellow oil. Yield: $75 \%(4.4 \mathrm{~g}, 23 \mathrm{mmol})$.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.84(\mathrm{~d}, J=15.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{dd}, J=7.3,1.1 \mathrm{~Hz}, 2 \mathrm{H})$, $7.29-7.16$ (m, 2H), 6.99 (d, $J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.39$ (s, 3H), 1.46 (s, 7H). ${ }^{13} \mathbf{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta 202.3,145.2,141.2,131.4,129.4,128.8,128.4,126.7,117.3,75.3$, 26.2, 21.2.
( E)-1-(4-bromophenyl)-4-hydroxy-4-methylpent-1-en-3-one (14b)
 to the general procedure. Yellow oil. Yield: $85 \%(6.5 \mathrm{~g}, 25.5$ mmol). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.66(\mathrm{~d}, J=15.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.52-7.31(\mathrm{~m}, 4 \mathrm{H})$, 7.09 (d, $J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.11(\mathrm{~s}, 1 \mathrm{H}), 1.41(\mathrm{~s}, 7 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta$ 202.1, 143.4, 132.9, 131.8, 129.6, 124.8, 119.0, 75.5, 26.1.
${ }^{249}$ a) C. Palomo, M. Oiarbide, R. Halder, M. Kelso, E. Gómez-Bengoa, J. M. García, J. Am. Chem. Soc. 2004, 126, 9188-9189. b) C. Palomo, M. Oiarbide, B. G. Kardak, J. M. García, A. Linden, J. Am. Chem. Soc. 2005, 127, 4154-4155.

## ( E)-4-hydroxy-1-(3-methoxyphenyl)-4-methylpent-1-en-3-one (14c)

The title compound 14d was prepared using 3methoxybenzaldehyde ( $6.6 \mathrm{~mL}, 60 \mathrm{mmol}, 2$ equiv.) according to the general procedure. Yellow oil. Yield: $75 \%$ ( $4.6 \mathrm{~g}, 24$ mmol). ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.75(\mathrm{~d}, J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.27(\mathrm{t}, J=7.9 \mathrm{~Hz}$, $1 \mathrm{H}), 7.15(\mathrm{dt}, J=7.8,1.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.08-7.01(\mathrm{~m}, 2 \mathrm{H}), 6.92(\mathrm{ddd}, J=8.1,2.6,1.0 \mathrm{~Hz}$, $1 \mathrm{H}), 4.04(\mathrm{~s}, 1 \mathrm{H}), 3.79(\mathrm{~s}, 3 \mathrm{H}), 1.43(\mathrm{~s}, 7 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right), \delta 202.3$, 159.7, 145.1, 135.5, 129.8, 121.0, 118.6, 116.4, 113.5, 75.5, 55.1, 26.3.

## ( $\boldsymbol{E}$ )-4-hydroxy-4-methyl-1-phenylpent-1-en-3-one (14d) ${ }^{250}$

The title compound $\mathbf{1 4 b}$ was prepared using benzaldehyde ( 6.1 $\mathrm{mL}, 60 \mathrm{mmol}, 2$ equiv.) according to the general procedure. Yellow oil. All data were consistent with those previously reported. Yield: $95 \%(5.4 \mathrm{~g}, 28 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.83$ (d, $J=15.7$ $\mathrm{Hz}, 1 \mathrm{H}), 7.58(\mathrm{~m}, 2 \mathrm{H}), 7.40(\mathrm{~m}, 3 \mathrm{H}), 7.02(\mathrm{~d}, J=15.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.00(\mathrm{~s}, 1 \mathrm{H}), 1.45(\mathrm{~s}$, $6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta 7.83(\mathrm{~d}, J=15.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~m}, 2 \mathrm{H}), 7.40(\mathrm{~m}$, $3 \mathrm{H}), 7.02(\mathrm{~d}, J=15.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.00(\mathrm{~s}, 1 \mathrm{H}), 1.45(\mathrm{~s}, 6 \mathrm{H})$.

## Preparation of (E)-2-hydroxy-2-methylhept-4-en-3-one (14e)

Known compound $\mathbf{1 4} \mathbf{e}^{251}$ was prepared according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: ${ }^{252}$ Methyl 2-hydroxyisobutyrate ( $6.9 \mathrm{~mL}, 60 \mathrm{mmol}, 1.2$ equiv.) was added under a nitrogen atmosphere to a solution of dimethyl amino pyridine ( $1.22 \mathrm{~g}, 10 \mathrm{mmol}$, 0.2 equiv.), triethylamine ( $10 \mathrm{~mL}, 50 \mathrm{mmol}, 1$ equiv.) and trimethylchlorosilane ( 6.3 $\mathrm{mL}, 50 \mathrm{mmol}, 1$ equiv.) in 50 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The reaction mixture was stirred at room temperature for 24 hours. After filtering over celite to remove the salt, the filtrate was diluted with diethyl ether $(150 \mathrm{~mL})$ and the resulting solution was washed with brine (1

[^96]x 50 mL ) and water ( $1 \times 50 \mathrm{~mL}$ ). The solvent was removed under reduced pressure to give the trimethylsilyl ether, which was used as such without further purification. Dimethyl methyl phosphonate ( $13.8 \mathrm{~mL}, 130 \mathrm{mmol}, 2.5$ equiv.) in dry THF ( 40 mL ) was added dropwise to a cold solution of $n \mathrm{BuLi}(1.6 \mathrm{M}$ in hexanes, $79 \mathrm{~mL}, 130 \mathrm{mmol}$, 2.5 equiv.) in dry THF ( 80 mL ) at $-78^{\circ} \mathrm{C}$ under a nitrogen atmosphere. After 30 min of stirring at the same temperature, a solution of the crude triethylsilyl ether $(16 \mathrm{~g}, 50$ mmol, 1 equiv.) in dry THF ( 100 mL ) was added dropwise at $-78^{\circ} \mathrm{C}$. The mixture was stirred at the same temperature $\left(-78{ }^{\circ} \mathrm{C}\right)$ for 3 h and then quenched at this temperature with a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 200 mL ). The reaction mixture was allowed to reach room temperature, it was extracted with diethyl ether ( $3 \times 250 \mathrm{~mL}$ ) and dried over $\mathrm{MgSO}_{4}$. The solvent was then evaporated under reduced pressure to get phosphonic acid dimethyl ester, which was used for the next step without further purification. Yield: $99 \%$, ( $14.6 \mathrm{~g}, 49.5 \mathrm{mmol}$ ).
$\mathbf{2}^{\text {nd }}$ step: Dried $\mathrm{LiCl}\left(1.17 \mathrm{~g}, 27 \mathrm{mmol}\right.$, 1 equiv.) and $\mathrm{Et}_{3} \mathrm{~N}$ ( $3.8 \mathrm{~mL}, 27 \mathrm{mmol}, 1$ equiv.) were added successively to a solution of (3-methyl-2-oxo-3trimethylsilyloxybutyl)phosphonic acid dimethyl ester ( $8.0 \mathrm{~g}, 27 \mathrm{mmol}$ ) in dry MeCN ( 67 mL ). The resulting milky suspension was stirred for 15 min at room temperature and the propanal ( $3.9 \mathrm{~mL}, 54 \mathrm{mmol}, 2$ equiv.) was added dropwise. The mixture was stirred for 40 h , diluted with water and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The crude was dissolved in methanol ( 200 mL ) and a solution of hydrofluoric acid (HF) ( $48 \%$ in water, 5 mL ) was added. The resulting mixture was stirred for 0.5 h at room temperature and then was neutralized by addition of a saturated solution of $\mathrm{NaHCO}_{3}$. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100$ mL ) and the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and evaporated to afford the crude desilylated product that was purified by flash silica gel chromatography (hexane/EtOAc, 98:2). Colourless oil. All spectroscopic data were consistent with those previously reported. Yield: $75 \%(3.2 \mathrm{mg}, 20 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.22-7.10(\mathrm{~m}, 1 \mathrm{H}), 6.46(\mathrm{~d}, J=15.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.09(\mathrm{~s}, 1 \mathrm{H}), 2.30-2.20(\mathrm{~m}, 2 \mathrm{H}), 1.55-$ $1.43(\mathrm{~m}, 2 \mathrm{H}), 1.40(\mathrm{~s}, 6 \mathrm{H}), 0.97(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$.

### 5.4.1.3. Preparation of $\alpha$-methyl $\alpha$ '-oxy enones 15

## Preparation of $\alpha$-methyl $\alpha^{\prime}$-hydroxy enone 15

Known enone $\mathbf{1 5}^{253}$ was prepared according to the following procedure:

$\mathbf{1}^{\text {st }}$ step: To a solution of methyl 2-hydroxy-2-methylpropanoate ( $1.77 \mathrm{~g}, 15 \mathrm{mmol}, 1$ equiv.) and $N, O$-dimethylhydroxylamine hydrochloride ( $15 \mathrm{mmol}, 1.5$ equiv.) in dry THF ( 50 mL ), ${ }^{i} \mathrm{PrMgCl}\left(2 \mathrm{M}\right.$ in THF; $60 \mathrm{mmol}, 4$ equiv.) was added at $-20^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 1.5 h at room temperature. The reaction was then quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{x}$ 30 mL ). The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and filtered and the solvent was evaporated under reduced pressure and crude material was purified by flash column chromatography (hexane/EtOAc, 80:20) to obtain the desired amide product as colourless oil. Yield: $90 \%$ ( $1.99 \mathrm{~g}, 13.5 \mathrm{mmol}$ ). All spectroscopic data were consistent with those previously reported. ${ }^{254}{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 4.29(\mathrm{~s}, 1 \mathrm{H}), 3.73$ (s, $3 \mathrm{H}), 3.28(\mathrm{~s}, 3 \mathrm{H}), 1.47(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 177.2,72.1,61.0,33.6$, 26.5 .
$\mathbf{2}^{\text {nd }}$ step: To a solution of the starting amide ( $1.85 \mathrm{~g}, 10 \mathrm{mmol}$, 1 equiv.) in $\mathrm{Et}_{2} \mathrm{O}$ (20 mL ), isopropenyl magnesium bromide ( 0.5 M in THF; 60 mL , 3 equiv.) was added at $20^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 16 h . The reaction was quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic phases were dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was evaporated under reduced pressure. The crude product was purified by flash column chromatography (pentane/ $\mathrm{Et}_{2} \mathrm{O} 95: 5$ ) to obtain the desired product 15 as a colourless oil. Yield: $65 \%$ ( $833 \mathrm{mg}, 6.5 \mathrm{mmol}$ ). All spectroscopic data were consistent with those previously reported. ${ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.91(\mathrm{~s}, 1 \mathrm{H}), 5.75(\mathrm{~s}, 1 \mathrm{H}), 4.11(\mathrm{~s}$, $1 \mathrm{H}), 1.86(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 206.3,140.3,125.6,72.0$, 28.3, 19.9.

[^97]
## Preparation of $\alpha$-methyl $\alpha$ '-trimethylsilyloxy enone 15

3-(Trimethylsilyl)-2-oxazolidinone (TMSO) ( $1.1 \mathrm{~mL}, 7.5 \mathrm{mmol}, 1.5$ equiv.) and a drop of trifluoromethanesulfonic acid were added to enone 15 ( $640 \mathrm{mg}, 5.0 \mathrm{mmol}, 1$ equiv.). The reaction mixture was stirred at room temperature for 2 h , diluted with pentane ( 20 mL ) and subsequently washed with water $\left(20 \mathrm{~mL}\right.$ ) and $\mathrm{NaHCO}_{3}$ sat. (20 mL ). The organic phase was then dried over with $\mathrm{MgSO}_{4}$ and concentred under reduced pressure to afford the title compound $\mathbf{1 5}^{\prime}$, as a yellow oil. Yield: $82 \%$ ( $820 \mathrm{mg}, 4.1$ mmol). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.34(\mathrm{~s}, 1 \mathrm{H}), 5.78(\mathrm{~s}, 1 \mathrm{H}), 1.89(\mathrm{~s}, 3 \mathrm{H}), 1.46(\mathrm{~s}$, $6 \mathrm{H}), 0.10(\mathrm{~s}, 9 \mathrm{H})$.

### 5.4.1.4. Preparation of $\alpha$ '-oxy dienones 16

## Preparation of $\boldsymbol{\alpha}$ '-hydroxy dienone $\mathbf{1 6}^{255}$

3-Hydroxy-3-methyl-2-butanone ( $2.1 \mathrm{~mL}, 20 \mathrm{mmol}, 1$ equiv.) in THF ( 2.5 mL ) was slowly added to a solution of $n$-butyllithium ( 1.6 M in $\mathrm{Et}_{2} \mathrm{O} ; 32 \mathrm{~mL}, 50 \mathrm{mmol}, 2.5$ equiv.) and diisopropylamine ( $7.7 \mathrm{~mL}, 50 \mathrm{mmol}, 1.5$ equiv.) in THF ( 25 mL ) at $-78{ }^{\circ} \mathrm{C}$ and the resulting solution was stirred at the same temperature for 5 min . Next, acrolein ( $1.23 \mathrm{~g}, 22 \mathrm{mmol}, 1.1$ equiv.) in THF ( 2.5 mL ) was added over a 10 min period and then $p$-toluenesulfonyl chloride ( $1.84 \mathrm{~mL}, 24 \mathrm{mmol}, 1.2$ equiv.) was added dropwise. The reaction mixture was allowed to warm to room temperature and was stirred until completion of the reaction (TLC monitoring). The solvent was eliminated under reduced pressure and the residue was redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{~mL})$. The organic phase was then washed with water $(80 \mathrm{~mL})$ and a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(80 \mathrm{~mL})$, dried over with $\mathrm{MgSO}_{4}$ and concentred under reduced pressure to afford the crude product, which was purified by column chromatography on silica gel (eluting hexane/EtOAc 80:20). Yellow oil. Yield: $75 \%(2.1 \mathrm{~g}, 15 \mathrm{mmol}) .{ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.48-$

[^98]$7.36(\mathrm{~m}, 1 \mathrm{H}), 6.59-6.42(\mathrm{~m}, 2 \mathrm{H}), 5.79-5.59(\mathrm{~m}, 2 \mathrm{H}), 3.94(\mathrm{~s}, 1 \mathrm{H}), 1.39(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 202.7,145.4,134.9,128.0,122.6,75.4,26.3$.

## Preparation of $\alpha^{\prime}$ 'trimethylsilyloxy dienone 16'

3-(Trimethylsilyl)-2-oxazolidinone (TMSO) ( $1.1 \mathrm{~mL}, 7.5 \mathrm{mmol}, 1.5$ equiv.) and a drop of trifluoromethanesulfonic acid were added to dienone 16 ( $700 \mathrm{mg}, 5.0 \mathrm{mmol}, 1$ equiv.). The reaction mixture was stirred at room temperature for 2 h , diluted with pentane ( 20 mL ) and subsequently washed with water ( 20 mL ) and $\mathrm{NaHCO}_{3}$ sat. (20 mL ). The organic phase was then dried over with $\mathrm{MgSO}_{4}$ and concentred under reduced pressure to afford the title compound $\mathbf{1 6}^{\prime}$, as a yellow oil. Yield: $88 \%$ ( $934 \mathrm{mg}, 4.4$ mmol). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.29(\mathrm{dd}, J=15.4,11.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.81(\mathrm{~d}, J=$ $15.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.62-6.42(\mathrm{~m}, 1 \mathrm{H}), 5.76-5.50(\mathrm{~m}, 2 \mathrm{H}), 1.37(\mathrm{~s}, 6 \mathrm{H}), 0.14(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 203.2,143.5,135.6,126.3,124.6,30.9,27.2,2.2$.

### 5.4.2. Preparation of $\mathbf{5 H}$-oxazol-4-ones (oxazolones) 17

Known oxazolones 17A-17D and new oxazolone 17E were prepared according to the synthetic sequence described by Misaki and Sugimura: ${ }^{256}$

$\mathbf{1}^{\text {st }}$ step: ${ }^{257}$ The corresponding amino acid ( $40 \mathrm{mmol}, 1$ equiv.) is solubilized in $48 \%$ $\mathrm{HBr}(40 \mathrm{~mL})$ and 36 mL water. The reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and a solution of $\mathrm{NaNO}_{2}$ ( $4.4 \mathrm{~g}, 64 \mathrm{mmol}, 1.6$ equiv.) in 10 mL water was added dropwise. The mixture was stirred for 2.5 h at room temperature, then concentrated to remove acid

[^99]vapour, and extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times 10 \mathrm{~mL})$. The organic layers were washed with water, brine, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure yielding the corresponding 2-bromo-carboxylic acid as colorless oil, which was used without further purification.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p}:{ }^{258}$ A solution of oxalyl chloride ( $1.0 \mathrm{~mL}, 12 \mathrm{mmol}, 1.2$ equiv.) in dry dichloromethane ( 6 mL ) was added slowly to a stirred solution of the corresponding bromoacid ( $10 \mathrm{mmol}, 1 \mathrm{eq}$.) in dichloromethane ( $0.5 \mathrm{~mL} / \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$, then 2 drops of DMF were added. Gas evolution was observed, and the system was allowed to stir at room temperature for 2 additional hours. Volatiles were removed under reduced pressure and the resulting crude material was added over 5 min to a suspension of benzamide ( $1.2 \mathrm{~g}, 10 \mathrm{mmol}, 1.0 \mathrm{eq}$. ) and pyridine ( $0.81 \mathrm{~mL}, 10 \mathrm{mmol}, 1.0 \mathrm{eq}$.$) in THF$ $(12.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The resulting suspension was stirred overnight at room temperature and diluted with EtOAc. The mixture was acidified to pH 2 with HCl 1 M and the phases were separated. The aqueous phase was extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ) and the combined organic layers were washed with water ( $3 \times 20 \mathrm{~mL}$ ) and brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$, and filtered. Volatiles were removed under reduced pressure. The imide product was purified by flash chromatography on silica gel (eluting with hexane/EtOAc 90:10).
$\mathbf{3}^{\text {rd }}$ step: ${ }^{256}$ A suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(2.0 \mathrm{~g}, 20 \mathrm{mmol}, 2.0$ equiv. $)$ in methyl tertbutylether (MTBE) ( 20 mL ) was refluxed for 2 h to remove water using a Dean-Stark trap. The suspension was cooled to room temperature and the corresponding imide was added in one portion. The resulting mixture was refluxed overnight and cooled to room temperature. Inorganic salts were filtered through a celite pad with suction and the filter cake was washed with EtOAc. The combined organic layers were concentrated in vacuo and the crude material was purified by flash chromatography on silica gel (eluting with hexane/EtOAc 80:20).

5-isobutyl-2-phenyloxazol-4(5H)-one (17A) ${ }^{259}$

The title compound 17A was prepared from 2-bromo-4-methylpentanoic acid $(2.0 \mathrm{~g}, 10 \mathrm{mmol})$ according to the general procedure. White solid. All data were consistent with those previously reported. m. p. $=57-59$ ${ }^{\circ} \mathrm{C}$. Yield: $54 \%(1.2 \mathrm{~g}, 5.4 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26-$ $8.15(\mathrm{~m}, 2 \mathrm{H}), 7.74-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.59-7.47(\mathrm{~m}, 2 \mathrm{H}), 4.79(\mathrm{dd}, J=10.0,3.5 \mathrm{~Hz}, 1 \mathrm{H})$, $2.11-1.82(\mathrm{~m}, 2 \mathrm{H}), 1.77-1.62(\mathrm{~m}, 1 \mathrm{H}), 1.04(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( 75 MHz ,

## 5-methyl-2-phenyloxazol-4(5H)-one (17D) ${ }^{256}$

The title compound 17D was prepared from 2-bromopropanoic acid (1.5 $\mathrm{g}, 10 \mathrm{mmol}$ ) according to the general procedure. White solid. All data were consistent with those previously reported. m. p. $=68-70^{\circ} \mathrm{C}$. Yield: $62 \%(1.1 \mathrm{~g}, 6.2 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.15-7.99(\mathrm{~m}$, 2H), $7.64-7.46(\mathrm{~m}, 1 \mathrm{H}), 7.46-7.35(\mathrm{~m}, 2 \mathrm{H}), 4.72(\mathrm{q}, 1 \mathrm{H}), 1.49(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right), \delta 192.0,185.8,134.8,129.6,128.5,125.4,77.6,16.0$. MS: calculated for $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{NO}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 176.0712; found, 176.0717.

[^101]
## 5-pentyl-2-phenyloxazol-4(5H)-one (17E)

The title compound $\mathbf{1 7 E}$ was prepared from 2-bromopropanoic acid (1.5 $\mathrm{g}, 10 \mathrm{mmol}$ ) according to the general procedure. White solid. m. p. $=69-$ $70{ }^{\circ} \mathrm{C}$. Yield: $44 \%(1.1 \mathrm{~g}, 4.4 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.23$ (dd, $J=8.4,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.76-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.54(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H})$, 4.78 (dd, $J=7.6,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-2.00(\mathrm{~m}, 1 \mathrm{H}), 1.86(\mathrm{td}, J=14.8,7.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.51$ (dt, $J=15.7,6.9 \mathrm{~Hz}, 2 \mathrm{H}$ ), 1.33 (ddd, $J=11.2,8.1,4.5 \mathrm{~Hz}, 6 \mathrm{H}), 0.87(\mathrm{t}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right), \delta 8.23(\mathrm{dd}, J=8.4,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.76-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.54$ $(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.78(\mathrm{dd}, J=7.6,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-2.00(\mathrm{~m}, 1 \mathrm{H}), 1.86(\mathrm{td}, J=$ $14.8,7.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.51(\mathrm{dt}, J=15.7,6.9 \mathrm{~Hz}, 2 \mathrm{H}), 1.33(\mathrm{ddd}, J=11.2,8.1,4.5 \mathrm{~Hz}, 6 \mathrm{H})$, $0.87(\mathrm{t}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H})$. MS: calculated for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{NO}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 246.1494; found, 246.1494.

### 5.4.3. Preparation of $\alpha$-cyanoacetate 30

$\alpha$-Cyanoacetate 30 was synthesised according to the procedure previously described in the literature: ${ }^{262}$

A solution of 2-(p-tolyl)acetonitrile ( $1.3 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.) in THF ( 10 mL ) was added dropwise to a solution of LDA ( $3.1 \mathrm{~mL}, 25 \mathrm{mmol}, 2.5$ equiv.) in THF ( 30 mL ) cooled to $-78^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir at $-78^{\circ} \mathrm{C}$ for 45 min . and then at room temperature for an additional 45 minutes. Then it was cooled to -78 ${ }^{\circ} \mathrm{C}$ and a solution of di-tert-butyl dicarbonate ( $2.62 \mathrm{~g}, 12 \mathrm{mmol}, 1.2$ equiv.) in THF ( 10 mL ) was added dropwise via syringe. After stirring at $-78^{\circ} \mathrm{C}$ for 16 hours, the mixture was quenched with saturated ammonium chloride ( 20 mL ) and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \mathrm{x}$ $50 \mathrm{~mL})$. The organic layer was washed with $1 \mathrm{~N} \mathrm{HCl}(30 \mathrm{~mL})$, brine ( 30 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure and the resulting crude oil was purified by silica gel flash chromatography (hexane/EtOAc 95:5) to yield the desired cyanoester 30 as a clear oil. The characterization data were coincident with the previously reported. Yield: $75 \%(1.7 \mathrm{~g}, 7.5 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.32$ (d, $J=8.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.21(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.56(\mathrm{~s}, 1 \mathrm{H}), 2.36(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 164.3,139.1,130.1,127.8,116.3,84.5,44.6,27.8,21.3$.

[^102]
### 5.4.4. 1,4-addition of oxazolones to unsubstituted $\alpha^{\prime}$-silyloxy enone 13b

### 5.4.4.1. General procedure

To a mixture of the corresponding oxazolone 17 ( 1 equiv., 0.3 mmol ) and the enone $\mathbf{1 3 b}$ ( $83.9 \mathrm{mg}, 3.0$ equiv., 0.9 mmol ), in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.9 \mathrm{~mL}$ ) at room temperature the catalyst C8 ( $20 \mathrm{~mol} \%$ ) was added. The resulting suspension was stirred at the same temperature until consumption of the oxazolone (monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). Then, 3 mL of methanol and 0.6 mL of aqueous $\mathrm{HF} 48 \%$ were added and the mixture was stirred for 45 min . The reaction was treated at $0^{\circ} \mathrm{C}$ with saturated solution of $\mathrm{NaHCO}_{3}$ until pH 7 . The product was extracted from the aqueous phase with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 3 \mathrm{~mL})$ and the combined organic phases were dried with $\mathrm{MgSO}_{4}$. Evaporation of the solvent under reduced pressure gave the title products 18 , which were purified by flash column chromatography (eluting hexane/EtOAc 80:20).

Racemic reactions were conducted following the procedure for the asymmetric version using enone 13a ( 3 equiv.) and TEA ( $20 \mathrm{~mol} \%$ ) as the catalyst.

### 5.4.4.2. Characterization data for compounds $\mathbf{1 8}$

(R)-5-(4-Hydroxy-4-methyl-3-oxopentyl)-5-isobutyl-2-phenyloxazol-4(5H)-one (18A)

The title compound was obtained following the general procedure from oxazolone 17A ( $65 \mathrm{mg}, 0.30 \mathrm{mmol}$ ). Colourless oil. Yield: $80 \%$ ( $79 \mathrm{mg}, 0.24 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{22}=$ $+10.7^{\circ}\left(c=1.00,93 \%\right.$ ee, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 8.22-8.09(\mathrm{~m}, 2 \mathrm{H}), 7.73-7.61(\mathrm{~m}, 1 \mathrm{H}), 7.57-7.46(\mathrm{~m}, 2 \mathrm{H}), 3.56(\mathrm{~s}, 1 \mathrm{H})$, $2.57-2.47(\mathrm{~m}, 1 \mathrm{H}), 2.38-2.23(\mathrm{~m}, 1 \mathrm{H}), 2.22-2.08(\mathrm{~m}, 1 \mathrm{H}), 2.04-1.84(\mathrm{~m}, 2 \mathrm{H}), 1.82$ $-1.64(\mathrm{~m}, 2 \mathrm{H}), 1.25(\mathrm{~s}, 3 \mathrm{H}), 1.21(\mathrm{~s}, 3 \mathrm{H}), 0.88$ (dd, $J=10.0,6.4 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}$ ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.7,193.4,185.6,130.0,129.0,125.4,90.2,76.4,60.3,44.4$, 29.7, 29.0, 26.4, 23.9, 23.3, 14.1. MS: calculated for $\mathrm{C}_{19} \mathrm{H}_{26} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 332.1862$;
found, 332.1866. The enantiomeric purity was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 85:15; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 18.1 min (major), 22.4 min (minor)).
(S)-5-(4-Hydroxy-4-methyl-3-oxopentyl)-2-phenyl-5-propyloxazol-4(5H)-one (18B)

The title compound was obtained following the general procedure from oxazolone 17B ( $61 \mathrm{mg}, 0.30 \mathrm{mmol}$ ). Colourless oil. Yield: $86 \%(52 \mathrm{mg}, 0.26 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{22}=$ $+58.4^{\circ}\left(c=1.00,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{1} \mathbf{H}-\mathbf{N M R}(300 \mathrm{MHz}$,

The enantiomeric purity was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 66.6 min (major), 72.7 min (minor)).

### 5.4.5. 1,4-addition of oxazolones to $\boldsymbol{\beta}$-substituted $\boldsymbol{\alpha}$ '-hydroxy enones 14

5.4.5.1. General procedure

To a mixture of the corresponding oxazolone 17 ( $0.15 \mathrm{mmol}, 1$ equiv.) and the corresponding enone $\mathbf{1 4}$ ( $0.45 \mathrm{mmol}, 3.0$ equiv.), in 1,2-dichloroethane $(0.45 \mathrm{~mL})$ at 70 ${ }^{\circ} \mathrm{C}$, catalyst $\mathbf{C} 7(9.5 \mathrm{mg}, 10 \mathrm{~mol} \%)$ was added. The resulting mixture was stirred at the same temperature until consumption of the starting oxazolone as monitored by ${ }^{1} \mathrm{H}$ -

NMR. The crude product was purified by flash column chromatography (eluting hexane/EtOAc 80:20).

The same above procedure was followed except that reactions were run at $50^{\circ} \mathrm{C}$ and DBU was used as the catalyst instead of $\mathbf{C} 7$.

### 5.4.5.2. Characterization data for compounds 19

## (S)-5-((R)-4-Hydroxy-4-methyl-3-oxo-1-(p-tolyl)pentyl)-5-isobutyl-2-phenyloxazol-4(5H)-one (19Aa)

 The title compound was obtained following the general procedure from oxazolone $\mathbf{1 7 A}(33 \mathrm{mg}, 0.15 \mathrm{mmol})$ and enone 14a ( $92 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) in a $13: 1 \mathrm{dr}$. Yellow oil. Yield: $67 \%$ $(43 \mathrm{mg}, 0.10 \mathrm{mmol})$. Data of major isomer: $[\alpha]_{\mathrm{D}}{ }^{25}=-45.4^{\circ}(c$ $=1.00,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.18$ $-8.08(\mathrm{~m}, 2 \mathrm{H}), 7.74-7.62(\mathrm{~m}, 1 \mathrm{H}), 7.52(\mathrm{dd}, J=8.3,7.2 \mathrm{~Hz}$, 2H), $7.17-7.08$ (m, 2H), $7.05-6.95(\mathrm{~m}, 2 \mathrm{H}), 3.85(\mathrm{dd}, J=10.8,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.45-$ $3.24(\mathrm{~m}, 2 \mathrm{H}), 2.72(\mathrm{dd}, J=17.5,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.21(\mathrm{~s}, 3 \mathrm{H}), 1.80(\mathrm{dd}, J=6.2,4.2 \mathrm{~Hz}$, $2 \mathrm{H}), 1.64-1.52(\mathrm{~m}, 1 \mathrm{H}), 1.23(\mathrm{~s}, 3 \mathrm{H}), 1.04(\mathrm{~s}, 3 \mathrm{H}), 0.86(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.77(\mathrm{~d}, J$ $=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.1,193.4,185.7,137.2,135.2,134.0$, 129.9, 129.0, 128.8, 125.4, 92.8, 76.3, 46.3, 43.6, 35.8, 26.0, 24.1, 23.8, 20.9. MS: calculated for $\mathrm{C}_{26} \mathrm{H}_{32} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 422.2331; found, 422.2314. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IB, hexane/isopropanol, 98:2; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 18.8 min (minor), 18.8 min (major)).

## (S)-5-Hexyl-5-((R)-4-hydroxy-4-methyl-3-oxo-1-(p-tolyl)pentyl)-2-phenyloxazol-4(5H)-one (19Ea)

 The title compound was obtained following the general procedure from oxazolone $\mathbf{1 7 E}(37 \mathrm{mg}, 0.15 \mathrm{mmol})$ and enone 14a ( $92 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) in a $13: 1 \mathrm{dr}$. Yellow oil. Yield: $80 \%$ $(55 \mathrm{mg}, 0.12 \mathrm{mmol})$. Data of major isomer: $[\alpha]_{\mathrm{D}}{ }^{25}=-53.6^{\circ}(c$ $=1.00,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.23$ -8.13 (m, 2H), $7.78-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.60-7.48(\mathrm{~m}, 2 \mathrm{H}), 7.16$ (d, $J=8.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.04 (d, $J=7.9 \mathrm{~Hz}, 2 \mathrm{H}$ ), 3.86 (dd, $J=10.8,3.3 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.27 (dd, $J$ $=17.4,10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.70(\mathrm{dd}, J=17.4,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.24(\mathrm{~s}, 3 \mathrm{H}), 1.21(\mathrm{~s}, 3 \mathrm{H}), 1.13$ $(\mathrm{m}, 8 \mathrm{H}), 1.04(\mathrm{~s}, 3 \mathrm{H}), 0.81-0.72(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 210.9,193.2$,

### 5.4.6. 1,4-addition of oxazolones to $\alpha$-substituted $\alpha$ '-hydroxy enone 15

5.4.6.1. General procedure

To a mixture of the corresponding oxazolone 17 ( $0.30 \mathrm{mmol}, 2$ equiv.) and enone 15 ( $0.15 \mathrm{mmol}, 1$ equiv.), in 1,2-dichloroethane ( 0.45 mL ) at $50^{\circ} \mathrm{C}$, catalyst $\mathbf{C 1 3}$ ( $12.3 \mathrm{mg}, 10 \mathrm{~mol} \%$ ) was added. The resulting mixture was stirred at the same temperature until consumption of the starting oxazolone as monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. The crude product was submitted to flash column chromatography (eluting hexane/EtOAc 80:20), affording the desired adduct as a mixture of diastereomers.

The same above procedure was followed except DBU was used as the catalyst instead of C13.

### 5.4.6.2. Characterization data for compounds 22

(5S)-5-(4-Hydroxy-2,4-dimethyl-3-oxopentyl)-2-phenyl-5-propyloxazol-4(5H)-one (22B)

The title compound was obtained following the general procedure from oxazolone $\mathbf{1 7 B}(61 \mathrm{mg}, 0.30 \mathrm{mmol})$ in a $1: 1$ $d r$. Yellow oil. Yield: $69 \%$ ( $34 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). Data of major isomer: ${ }^{1} \mathbf{H}$-NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.19(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, 2H), $7.82-7.64(\mathrm{~m}, 1 \mathrm{H}), 7.59-7.48(\mathrm{~m}, 2 \mathrm{H}), 3.53(\mathrm{~s}, 1 \mathrm{H}), 3.21-3.06(\mathrm{~m}, 1 \mathrm{H}), 2.31$ (dd, $J=15.0,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.04(\mathrm{dd}, J=15.0,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.96-1.78(\mathrm{~m}, 2 \mathrm{H}), 1.42(\mathrm{~s}$, $3 \mathrm{H}), 1.36(\mathrm{~s}, 3 \mathrm{H}), 1.26-1.20(\mathrm{~m}, 2 \mathrm{H}), 1.09(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.87(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathbf{C}-$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.8,193.1,185.8,135.4,130.1,129.0,125.6,90.8$, $76.9,38.8,38.3,34.7,26.7,26.6,19.5,16.2,13.8$. Data of minor isomer: ${ }^{1} \mathbf{H}-\mathbf{N M R}$ (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.35-3.24(\mathrm{~m}, 1 \mathrm{H}), 2.45(\mathrm{dd}, J=14.8,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.00-1.95(\mathrm{~m}$, $1 \mathrm{H}), 1.96-1.78(\mathrm{~m}, 2 \mathrm{H}), 1.28(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{~s}, 3 \mathrm{H}), 1.26-1.20(\mathrm{~m}, 2 \mathrm{H}), 1.16(\mathrm{~d}, \mathrm{~J}=$ $6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ), $0.89(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.5,193.7$, $185.8,135.4,130.1,129.0,125.6,90.4,76.8,39.0,38.1,34.2,26.9,26.6,12.0,16.2$, 13.8. MS: calculated for $\mathrm{C}_{19} \mathrm{H}_{26} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 332.1862$; found, 332.1866. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IB, hexane/isopropanol, 95:5; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 17.5 min (major), 28.0 min (minor)).
(5R)-5-Benzyl-5-(4-hydroxy-2,4-dimethyl-3-oxopentyl)-2-phenyloxazol-4(5H)-one (22C)

The title compound was obtained following the general procedure from oxazolone $\mathbf{1 7 C}(75 \mathrm{mg}, 0.30 \mathrm{mmol})$ in a 1.5:1 $d r$. Yellow oil. Yield: $77 \%$ ( $44 \mathrm{mg}, 0.12 \mathrm{mmol}$ ). Data of major
isomer: ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.05(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.72-7.61(\mathrm{~m}, 1 \mathrm{H})$, $7.60-7.42(\mathrm{~m}, 2 \mathrm{H}), 7.21-7.04(\mathrm{~m}, 5 \mathrm{H}), 3.46(\mathrm{~s}, 1 \mathrm{H}), 3.22(\mathrm{~s}, 2 \mathrm{H}), 3.30-3.09(\mathrm{~m}$, $1 \mathrm{H}), 2.43(\mathrm{dd}, J=15.0,5.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.13(\mathrm{dd}, J=15.0,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.45(\mathrm{~s}, 3 \mathrm{H}), 1.38$ ( $\mathrm{s}, 3 \mathrm{H}$ ) , $1.09(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.7$, 192.4, 185.5, 135.3, 132.7, 129.9, 129.0, 128.4, 127.5, 125.4, 90.6, 76.9, 42.6, 38.5, 34.9, 29.7, 26.7, 26.6, 19.3. Data of minor isomer: ${ }^{\mathbf{1}} \mathbf{H}$-NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.05(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, $2 \mathrm{H}), 7.72-7.61(\mathrm{~m}, 1 \mathrm{H}), 7.60-7.42(\mathrm{~m}, 2 \mathrm{H}), 7.21-7.04(\mathrm{~m}, 5 \mathrm{H}), 3.39-3.26(\mathrm{~m}$, $1 \mathrm{H}), 3.17$ (s, 2H), 2.56 (dd, $J=14.8,7.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.07 (dd, $J=14.8,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.27$ (s, 3H), 1.25 (s, 3H), 1.18 (d, $J=6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ). ${ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.4$, 193.0, 185.5, 135.3, 132.8, 129.9, 128.9, 128.4, 127.5, 125.5, 90.2, 77.2, 42.5, 38.8, 34.4, 29.7, 27.0, 26.7, 20.1. MS: calculated for $\mathrm{C}_{23} \mathrm{H}_{25} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 379.1784$; found, 379.1775. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 51.7 min (major), 112.0 min (minor)).
(5S)-5-(4-Hydroxy-2,4-dimethyl-3-oxopentyl)-5-methyl-2-phenyloxazol-4(5H)-one (22D)

The title compound was obtained following the general procedure from oxazolone 17D ( $53 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) in a $1: 1$ $d r$. Yellow oil. Yield: $74 \%$ ( $34 \mathrm{mg}, 0.11 \mathrm{mmol}$ ). Data of major isomer: ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.31-7.98(\mathrm{~m}, 2 \mathrm{H})$, $7.70(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.65-7.49(\mathrm{~m}, 2 \mathrm{H}), 3.53(\mathrm{~s}, 1 \mathrm{H}), 3.21(\mathrm{dt}, J=13.1,6.0 \mathrm{~Hz}$, $1 \mathrm{H}), 2.36(\mathrm{dd}, J=15.0,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.02(\mathrm{dd}, J=14.8,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.57(\mathrm{~s}, 3 \mathrm{H}), 1.45$ (s, 3H), 1.39 (s, 3H), 1.13 (d, $J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 216.7$, 193.4, 185.3, 135.4, 130.1, 129.0, 127.8, 87.5, 75.1, 39.6, 34.8, 26.8, 26.7, 22.3, 19.6. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IA, hexane/isopropanol, $95: 5$; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 14.6 min (major), 24.8 min (minor)).

### 5.4.7. Elaboration of adducts 18 and 19

5.4.7.1. Transformation of adducts to carboxylic acids 23-26

To a stirred solution of the ketol ( $0.8 \mathrm{mmol}, 1$ equiv.) in acetonitrile ( 10 mL ) at 0 ${ }^{\circ} \mathrm{C}$ a solution of cerium ammonium nitrate (CAN) ( 3 equiv., $1.46 \mathrm{~g}, 2.7 \mathrm{mmol}$ ) in water ( 5 mL ) was added dropwise and the mixture was stirred at the same temperature until starting material disappeared (TLC hexane/EtOAc 60:40). Water was then added ( 3 mL ) and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 10 \mathrm{~mL})$, after which the organic phases were combined, dried over $\mathrm{MgSO}_{4}$ and concentrated. The crude material was purified
by flash chromatography on silica gel (eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 95: 5$ ) obtaining the desired product.

## (R)-3-(5-benzyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5-yl)propanoic acid (23)

The title compound was obtained from adduct 18C according to the procedure above described. Yellow oil. Yield: $84 \%(217 \mathrm{mg}$, 0.67 mmol ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.12-8.02(\mathrm{~m}, 2 \mathrm{H})$, $7.66(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.48(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.17(\mathrm{~s}, 5 \mathrm{H})$, $3.22(\mathrm{~s}, 2 \mathrm{H}), 2.41-2.29(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 192.6,185.9,177.2$, 135.6, 133.1, 130.2, 129.2, 128.7, 127.8, 90.3, 42.3, 30.6, 28.4. MS: calculated for $\mathrm{C}_{19} \mathrm{H}_{18} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 324.1236; found, 324.1227.

## (S)-3-(5-Hexyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5-yl)propanoic acid (24)

The title compound was obtained from adduct 18D according to the procedure above described. Yellow oil. Yield: $82 \%$ ( 208 mg , 0.66 mmol ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.22-8.15(\mathrm{~m}, 2 \mathrm{H})$, $7.69(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.37-2.27(\mathrm{~m}$, $2 \mathrm{H}), 1.96-1.84(\mathrm{~m}, 2 \mathrm{H}), 1.34-1.14(\mathrm{~m}, 10 \mathrm{H}), 0.81(\mathrm{t}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 193.0,185.8,176.9,135.4,130.1,129.0,127.4,125.4,90.2,35.8,31.3$, 30.6, 28.9, 28.0, 22.7, 22.4, 13.9. MS: calculated for $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 318.1705$; found, 318.1691 . The enantiomeric purity was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane:ethanol, 70:30; flux $=0.5$ $\mathrm{mL} / \mathrm{min}$; retention times: 16.8 min (major), 18.2 min (minor)).

## (R)-3-(4-Bromophenyl)-3-((S)-5-hexyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5yl)propanoic acid (25)

The title compound was obtained from adduct 19Eb according to the procedure above described. Yellow oil. Yield: $80 \%$ ( 301 mg , 0.64 mmol ). ${ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.23-8.15(\mathrm{~m}, 2 \mathrm{H})$, $7.78-7.67(\mathrm{~m}, 1 \mathrm{H}), 7.55(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~d}, J=8.1 \mathrm{~Hz}$, $2 \mathrm{H}), 7.17(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.64(\mathrm{dd}, J=11.2,3.9 \mathrm{~Hz}, 1 \mathrm{H})$, $2.75(\mathrm{dd}, J=16.2,11.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.61(\mathrm{dd}, J=16.2,3.9 \mathrm{~Hz}, 1 \mathrm{H})$, $1.81(\mathrm{dt}, J=14.5,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.70-1.53(\mathrm{~m}, 2 \mathrm{H}), 1.20-1.06(\mathrm{~m}, 8 \mathrm{H}), 0.77(\mathrm{t}, J=6.8$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 192.6,185.9,175.1,136.0,135.6 .0,131.7$, 130.7, 130.0, 129.1, 125.0, 121.9, 92.4, 46.5, 34.9, 34.6, 31.3, 28.9, 22.6, 22.3, 13.9. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{27} \mathrm{BrNO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 472.1123$; found, 472.1109 .
(R)-3-((S)-5-Hexyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5-yl)-3-phenylpropanoic acid (26)
 $=16.1,11.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.61(\mathrm{dd}, J=16.1,3.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.91-1.76(\mathrm{~m}, 1 \mathrm{H}), 1.72-1.55$ $(\mathrm{m}, 1 \mathrm{H}), 1.19-1.05(\mathrm{~m}, 8 \mathrm{H}), 0.76(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $192.8,185.8,175.6,136.7,135.3,129.9,128.9,128.3,127.7,125.1,92.7,47.0,34.8$, 34.6, 31.2, 28.8, 22.5, 22.2, 13.7. MS: calculated for $\mathrm{C}_{25} \mathrm{H}_{27} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right), 394.2018$; found, 394.2003.

Elaboration of the carboxylic acids 25 and 26 to carboxylic esters 25 ' and 26'

The corresponding carboxylic acid ( $0.25 \mathrm{mmol}, 1$ equiv.) was dissolved in $\mathrm{MeOH}(7.5 \mathrm{~mL})$ and a solution of (trimethylsilyl)diazomethane in diethyl ether ( 2 M ; $0,38 \mathrm{~mL}, 0.75 \mathrm{mmol}, 3$ equiv.) was added dropwise, observing the coloration of the mixture. The reaction mixture was stirred for further 3 h and disappearance of the acid was checked by TLC (hexane/EtOAc 1:1). The reaction mixture was concentrated and the crude material was purified by flash column chromatography on silica gel (eluting with hexane/EtOAc 90:10) obtaining the desired product.

## ( $R$ )-3-(4-Bromophenyl)-3-((S)-5-hexyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5yl)propanoic acid (25')

The title compound was obtained from compound $\mathbf{2 5}$ according to the procedure above described. Yellow oil. Yield: $87 \%$ (103 $\mathrm{mg}, 0.22 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26-8.19(\mathrm{~m}$, $2 \mathrm{H}), 7.80-7.71$ (m, 1H), 7.59 (dd, $J=8.4,7.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.47 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.24(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.73(\mathrm{dd}, J=11.3$, $4.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.50(\mathrm{~s}, 3 \mathrm{H}), 2.79(\mathrm{dd}, J=15.8,11.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.65$ (dd, $J=15.8,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.95-1.79(\mathrm{~m}, 1 \mathrm{H}), 1.74-1.58(\mathrm{~m}, 1 \mathrm{H}), 1.25-1.07(\mathrm{~m}$, $8 \mathrm{H}), 0.81(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 192.6,185.9,170.7,136.2$,
$135.5,131.6,130.7,130.0,129.1,125.2,121.8,92.3,51.8,46.8,35.0,34.6,31.3,28.9$, 22.6, 22.3, 13.8. MS: calculated for $\mathrm{C}_{25} \mathrm{H}_{29} \mathrm{BrNO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 486.1280; found, 486.1258. The enantiomeric purity was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 80:20; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 14.2 min (minor), 15.8 min (major)).

## (R)-3-((S)-5-hexyl-4-oxo-2-phenyl-4,5-dihydrooxazol-5-yl)-3-phenylpropanoic acid (26')

The title compound was obtained from compound $\mathbf{2 6}$ according to the procedure above described. Yellow oil. Yield: $97 \%$ (99 $\mathrm{mg}, 0.24 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26-8.12$ (m, $2 \mathrm{H}), 7.74-7.63(\mathrm{~m}, 1 \mathrm{H}), 7.53(\mathrm{dd}, J=8.4,7.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.34-$ 7.17 (m, 5H), 3.72 (dd, $J=11.2,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.42(\mathrm{~s}, 3 \mathrm{H}), 2.79$ (dd, $J=15.6,11.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.62(\mathrm{dd}, J=15.7,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.91-1.76(\mathrm{~m}, 1 \mathrm{H}), 1.70-$ $1.55(\mathrm{~m}, 1 \mathrm{H}), 1.21-1.04(\mathrm{~m}, 8 \mathrm{H}), 0.75(\mathrm{t}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 192.9,185.8,170.8,137.0,135.2,129.9,128.9,128.3,127.7,125.2,92.6,51.5,47.4$, 34.9, 34.7, 31.2, 28.8, 22.5, 22.2, 13.7. MS: calculated for $\mathrm{C}_{25} \mathrm{H}_{3} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 408.2175; found, 408.2155. The enantiomeric purity was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 80:20; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 18.6 min (minor), 24.5 min (major)).

### 5.4.7.2. Synthesis of $\gamma$-lactone 28

Known $\gamma$-lactone 28 was prepared according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: ${ }^{263}$ The acid $23(0.6 \mathrm{mmol})$ was dissolved in a 2.5 M aqueous solution of NaOH $(6 \mathrm{~mL})$ and stirred at room temperature for 4 h . Then $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added and the mixture
${ }^{263}$ Adapted from: a) T. Misaki, G. Takimoto, T. Sugimura, J. Am. Chem. Soc. 2010, 132, 6286-6287. b) A. Paju, M. Laos, A. Jõgi, M. Päri, R. Jäälaid, T. Pehk, T. Kanger, M. Lopp, Tetrahedron Lett.. 2006, 47, 4491-4493.
was acidified to pH 1 using a concentrated aqueous solution of HCl . The phases were separated and the aqueous layer was extracted with EtOAc ( $2 \times 10 \mathrm{~mL}$ ). The organic phases were united and the solvent was eliminated under reduced pressure. The crude was then redissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(12 \mathrm{~mL})$ and a concentrated aqueous solution of HCl $(0.12 \mathrm{~mL})$ was added, letting the mixture to stir at room temperature overnight. The organic phase was washed with a saturated solution of $\mathrm{NaHCO}_{3}(3 \times 10 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure, obtaining $(R)-2$ - benzyl-5-oxotetrahydrofuran-2-carboxamide 27 as a white solid, which was used in the next step without further purification. Yield: $85 \%$ ( $112 \mathrm{mg}, 0.51 \mathrm{mmol}$ ). m. p. $=165-168^{\circ} \mathrm{C}$. ${ }^{1}$ H NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.40-7.15(\mathrm{~m}, 5 \mathrm{H}), 6.26(\mathrm{~s}, 1 \mathrm{H}), 5.66(\mathrm{~s}, 1 \mathrm{H}), 3.29(\mathrm{~d}, J$ $=14.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.09(\mathrm{~d}, J=14.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.67-2.49(\mathrm{~m}, 1 \mathrm{H}), 2.49-2.27(\mathrm{~m}, 2 \mathrm{H})$, 2.18 - 1.97 (m, 1H). ${ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.4,174.2,133.9,130.4,128.6$, 127.5, 87.7, 43.4, 29.9, 28.1. MS: calculated for $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{NO}_{3}\left(\mathrm{M}, \mathrm{H}^{+}\right)$, 220.0974; found, 220.0981 .
$\mathbf{2}^{\text {nd }}$ step: ${ }^{264}$ The above obtained adduct $\mathbf{2 8}(0.31 \mathrm{mmol})$ was dissolved in an aqueous concentrated HCl solution ( 2 mL ) and heated at $85^{\circ} \mathrm{C}$ in a sealed tube for 24 h . The reaction mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$ and the combined organic phases were dried over $\mathrm{MgSO}_{4}$ and the solvent eliminated under reduced pressure obtaining a brown solid. The solid was triturated with $\mathrm{Et}_{2} \mathrm{O}$ obtaining the desired carboxylic acid 30 as a white solid. Yield: $62 \%$ ( $43 \mathrm{mg}, 0.19 \mathrm{mmol}$ ). m. p. $=101-104$ ${ }^{\circ} \mathrm{C} .[\alpha]_{\mathrm{D}}{ }^{26}=-2.73^{\circ}(c=1.00$, acetone $)\left([\alpha]_{\mathrm{D}}{ }^{20} \mathrm{Lit}^{265}=-5.3^{\circ}(c=1.97\right.$, acetone $)$. All spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.35-7.24(\mathrm{~m}, 5 \mathrm{H}), 3.40(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.15(\mathrm{~d}, J=14.4 \mathrm{~Hz}$, $1 \mathrm{H}), 2.57-2.43(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.25(\mathrm{~m}, 1 \mathrm{H}), 2.24-2.06(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.67,175.49,133.42,130.57,128.64,127.62,85.80,42.14,29.96$, 27.93.

[^103]
### 5.4.8. 1,6-addition to $\alpha^{\prime}$-oxy dienones

### 5.4.8.1. General procedure

To a mixture of the corresponding nucleophile ( $0.15 \mathrm{mmol}, 1$ equiv.) and dienone 16 ( $42 \mathrm{mg}, 0.30 \mathrm{mmol}, 3.0$ equiv.), in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.45 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$, the selected catalyst ( $10 \mathrm{~mol} \%$ ) was added. The resulting mixture was stirred at the same temperature until consumption of the starting nucleophile as monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. The crude product was purified by flash column chromatography (eluting hexane/EtOAc 80:20).

For the racemic version of the reaction the same procedure was followed using DBU as the catalyst.

### 5.4.8.2. Characterization data for compounds 29 and 31

(E)-5-Hexyl-5-(6-hydroxy-6-methyl-5-oxohept-2-en-1-yl)-2-phenyloxazol-4(5H)-one (29)

The title compound was obtained following the general procedure from oxazolone $\mathbf{1 7 E}$ ( $37 \mathrm{mg}, 0.15 \mathrm{mmol}$ ) employing catalyst C17. Colourless oil. Yield: 79\% (39 $\mathrm{mg}, 0.12 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-3.9^{\circ}(c=0.80,40 \% e e$, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26-8.17(\mathrm{~m}, 2 \mathrm{H}), 7.71(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H})$, $7.60-7.51(\mathrm{~m}, 2 \mathrm{H}), 5.73(\mathrm{dt}, J=13.9,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.40(\mathrm{dt}, J=15.4,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.23$ - $3.14(\mathrm{~m}, 2 \mathrm{H}), 2.71-2.63(\mathrm{~m}, 2 \mathrm{H}), 1.99-1.88(\mathrm{~m}, 2 \mathrm{H}), 1.37-1.18(\mathrm{~m}, 14 \mathrm{H}), 0.84(\mathrm{t}$, $J=6.6 \mathrm{~Hz}, 3 \mathrm{H}$ ) ${ }^{13} \mathbf{C}-\mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.8,193.1,185.5,145.4,141.8$, $135.1,130.0,128.9,127.8,125.4,124.2,90.6,76.2,39.1,35.5,31.4,29.0,26.9,26.2$, 25.3, 22.8, 22.4, 13.9. MS: calculated for $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 386.2331; found, 386.2342. The enantiomeric purity of the major isomer was determined by chiral HPLC
analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 95:5; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 34.7 min (major), 37.4 min (minor)).

## ( E)-5-Hexyl-5-(6-hydroxy-6-methyl-5-oxohept-2-en-1-yl)-2-phenyloxazol-4(5H)-one (29')

The title compound was obtained as a byproduct following the general procedure from oxazolone $\mathbf{1 7 E}(37 \mathrm{mg}, 0.15 \mathrm{mmol})$ but at $70{ }^{\circ} \mathrm{C}$ in 1,2 -dichloroethane and employing catalyst $\mathbf{C} 7$. Colourless oil. Yield: $23 \%(11 \mathrm{mg}, 0.034 \mathrm{mmol}) .{ }^{1} \mathbf{H}-\mathrm{NMR}$ $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26-8.20(\mathrm{~m}, 2 \mathrm{H}), 7.77-7.68(\mathrm{~m}, 1 \mathrm{H}), 7.61-7.52(\mathrm{~m}, 2 \mathrm{H})$, $5.64-5.44(\mathrm{~m}, 1 \mathrm{H}), 5.26-5.08(\mathrm{~m}, 2 \mathrm{H}), 3.37(\mathrm{td}, J=9.8,3.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.90(\mathrm{dd}, J=$ $17.2,10.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.58(\mathrm{dd}, J=17.2,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.01-1.88(\mathrm{~m}, 2 \mathrm{H}), 1.33(\mathrm{~s}, 3 \mathrm{H})$, $1.28(\mathrm{~s}, 3 \mathrm{H}), 1.22(\mathrm{dd}, J=13.3,6.6 \mathrm{~Hz}, 8 \mathrm{H}), 0.82(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. MS: calculated for $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 386.2331; found, 386.2342.
tert-Butyl (E)-2-cyano-8-hydroxy-8-methyl-7-oxo-2-(p-tolyl)non-4-enoate (31)

The title compound was obtained following the general procedure from $\alpha$-cyanoacetate 30 ( $69 \mathrm{mg}, 0.15 \mathrm{mmol}$ ) employing catalyst C18. Colourless oil. Yield: $83 \%$ ( 46 $\mathrm{mg}, 0.12 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=+3.1^{\circ}(c=1.00,30 \% e e$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.50-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.01-6.88(\mathrm{~m}, 2 \mathrm{H}), 5.81$ (dt, $J=13.8,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.52(\mathrm{dt}, J=14.5,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.53(\mathrm{~s}, 1 \mathrm{H})$, $3.31(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 3.06(\mathrm{dd}, J=14.0,7.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.77(\mathrm{dd}, J=13.9,6.9 \mathrm{~Hz}$, $1 \mathrm{H}), 1.42(\mathrm{~s}, 9 \mathrm{H}), 1.36(\mathrm{~s}, 3 \mathrm{H}), 1.35(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}-\mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 211.8$, $165.9,159.6,128.2,127.2,126.9,126.2,118.4,114.2,84.2,76.3,55.2,54.1,40.6,39.2$, 27.5, 26.5. MS: calculated for $\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{NO}_{5} \mathrm{Na}\left(\mathrm{M}+\mathrm{Na}^{+}\right), 410.1943$; found, 410.1938. The enantiomeric purity of the major isomer was determined by chiral HPLC analysis of the crude reaction mixture (Daicel Chiralpak IC, hexane/isopropanol, 95:5; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 31.0 min (major), 35.8 min (minor)).

### 5.4.9. Preparation of $\boldsymbol{\alpha}$-alkenyl cycloalkanones 34

## Preparation of $\alpha$-styryl cycloalkanones (34A-34E)

Known cycloalkanones 34A and 34B and new cycloalkanones 34C-34E were synthesised following the procedure reported by Trofimov: ${ }^{266}$

34A-34E
A solution of the corresponding cyclic ketone ( $8 \mathrm{mmol}, 1$ equiv.), the corresponding alkyne ( $8 \mathrm{mmol}, 1$ equiv.) and potassium tert-butoxyde ( $900 \mathrm{mg}, 8$ mmol, 1 equiv.) in DMSO ( 20 mL ) was stirred at $100^{\circ} \mathrm{C}$ for 30 min in a sealed tube under argon. Te reaction mixture was then cooled to room temperature, water ( 20 mL ) was added and the mixture was neutralized with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}$. The resulting biphasic mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times 20 \mathrm{~mL})$, the combined organic extract was washed with water $(2 \times 20 \mathrm{~mL})$ and dried over $\mathrm{MgSO}_{4}$, and volatiles were removed under reduced pressure to obtain crude compound which was purified by silica gel flash column chromatography (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2} 1: 1$ ).

## (E)-2-Styrylcyclohexan-1-one (34A) $)^{266}$

The title compound was obtained following the general procedure above described starting from cyclohexanone ( $0.83 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) and phenylacetylene ( $0.88 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) as a yellow solid. Yield: $50 \%$ ( $800 \mathrm{mg}, 4.0 \mathrm{mmol}$ ). All data were consistent with those previously reported. ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.38(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.21(\mathrm{t}, J$ $=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.52-6.31(\mathrm{~m}, 2 \mathrm{H}), 3.26-3.15(\mathrm{~m}, 1 \mathrm{H}), 2.55-2.44(\mathrm{~m}, 1 \mathrm{H}), 2.44-$ $2.32(\mathrm{~m}, 1 \mathrm{H}), 2.25-2.13(\mathrm{~m}, 1 \mathrm{H}), 2.13-2.01(\mathrm{~m}, 1 \mathrm{H}), 1.99-1.86(\mathrm{~m}, 1 \mathrm{H}), 1.85-1.68$ ( $\mathrm{m}, 3 \mathrm{H}$ ).

## ( E)-2-Styrylcyclopentan-1-one (34B) $)^{267}$

The title compound was obtained following the general procedure above described starting from cyclopentanone ( $0.71 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) and phenylacetylene ( $0.88 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) as a yellow oil. Yield: $62 \%(1.3 \mathrm{~g}, 6.9 \mathrm{mmol})$. All data were consistent with those previously reported. ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.46-6.92(\mathrm{~m}, 5 \mathrm{H}), 6.47(\mathrm{~d}, J=16.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.24(\mathrm{dd}, J=$

[^104]16.1, $6.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.02-2.87(\mathrm{~m}, 1 \mathrm{H}), 2.45-2.02(\mathrm{~m}, 5 \mathrm{H}), 1.97-1.80(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 218.0,136.9,131.9,128.4,127.3,126.2,126.0,52.4,37.8$, 29.7, 20.7.

## ( E)-2-Styrylcycloheptan-1-one (34C)

The title compound was obtained following the general procedure above described starting from cycloheptanone ( $0.94 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) and phenylacetylene ( $0.88 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) as a yellow oil. Yield: $67 \%(1.2 \mathrm{~g}, 5.4 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.42-7.32(\mathrm{~m}, 2 \mathrm{H})$, $7.39-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.18(\mathrm{~m}, 1 \mathrm{H}), 6.43(\mathrm{~d}, J=16.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.32(\mathrm{dd}, J=16.0$, $7.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.35(\mathrm{ddd}, J=11.0,7.2,4.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.66-2.45(\mathrm{~m}, 2 \mathrm{H}), 2.06-1.82(\mathrm{~m}$, $4 \mathrm{H}), 1.77-1.57(\mathrm{~m}, 2 \mathrm{H}), 1.54-1.38(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.7$, $137.0,130.8,128.5,128.4,127.3,126.2,56.2,42.4,31.5,29.7,27.9,24.8$. MS: calculated for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 215.1436; found, 215.1432.

## (E)-2-Styrylcyclooctan-1-one (34D)

The title compound was obtained following the general procedure above described starting from cyclooctanone ( $1.0 \mathrm{~g} \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) and phenylacetylene ( $0.88 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) as a yellow oil. Yield: $74 \%(1.4 \mathrm{~g}, 5.9 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.39-$ $7.18(\mathrm{~m}, 5 \mathrm{H}), 6.45(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.27(\mathrm{dd}, J=16.0,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.39(\mathrm{ddd}, J=$ $11.2,7.7,3.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.60-2.23(\mathrm{~m}, 2 \mathrm{H}), 2.11-1.79(\mathrm{~m}, 4 \mathrm{H}), 1.79-1.63(\mathrm{~m}, 2 \mathrm{H})$, $1.60-1.37(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 216.7,136.9,130.9,128.4,128.3$, 127.3, 126.1, 55.0, 40.7, 32.4, 26.9, 26.1, 25.8, 24.5. MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{O}(\mathrm{M}+$ $\mathrm{H}^{+}$), 229.1592; found, 229.1604.

## (E)-2-(4-Methoxystyryl)-4,4-dimethylcyclohexan-1-one (34E)

The title compound was obtained following the general procedure above described starting from 4,4dimethylcyclohexanone ( $1.01 \mathrm{~g} \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) and 4 ethynylanisole ( $1.04 \mathrm{~mL}, 8 \mathrm{mmol}, 1$ equiv.) as a yellow oil.
Yield: $27 \%$ ( $490 \mathrm{mg}, 1.9 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.33$ (d, $J=8.8 \mathrm{~Hz}$, $1 \mathrm{H}), 6.86(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.40-6.21(\mathrm{~m}, 2 \mathrm{H}), 3.82(\mathrm{~s}, 2 \mathrm{H}), 3.37-3.24(\mathrm{~m}, 1 \mathrm{H})$, $2.64-2.46(\mathrm{~m}, 1 \mathrm{H}), 2.41-2.30(\mathrm{~m}, 1 \mathrm{H}), 1.95-1.64(\mathrm{~m}, 3 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}), 1.08$ (s, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 211.9,159.0,130.6,130.0,127.4,125.4,113.6$, 55.3, 49.7, 47.2, 38.2, 31.4, 30.8, 24.6. MS: calculated for $\mathrm{C}_{7} \mathrm{H}_{23} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 259.1698; found, 259.1711.

## Preparation of 2-(2-methylprop-1-en-1-yl)cyclohexan-1-one (34F)

Cycloalkanone 34F was prepared according to the synthetic procedure reported by Toste: ${ }^{268}$

$\mathbf{1}^{\text {st }}$ step: To a solution of $\mathrm{CuI}(380 \mathrm{mg}, 2 \mathrm{mmol}, 0.1$ equiv.) in THF ( 20 mL ) and 2-methyl-1-propenylmagnesium bromide ( 0.5 M in THF; $52 \mathrm{~mL}, 26 \mathrm{mmol}, 1.3$ equiv.) was added at $-78^{\circ} \mathrm{C}$. After stirring for 30 min cyclohexene oxide $(2.0 \mathrm{~mL}, 20 \mathrm{mmol}, 1$ equiv.) was added, and the resulting mixture was further stirred for 2 h at $-20^{\circ} \mathrm{C}$. The reaction was quenched by adding a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$ and the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $3 \times 50 \mathrm{~mL}$ ). The combined organic extract was washed with brine ( 50 mL ) and dried over $\mathrm{MgSO}_{4}$. Volatiles were removed under reduced pressure to obtain crude compound which was purified by silica gel flash column chromatography (hexane/EtOAc 80:20). Yield: 55\% ( $1.7 \mathrm{~g}, 11 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.99(\mathrm{~d}, J=9.3 \mathrm{~Hz}, 0 \mathrm{H}), 3.81(\mathrm{qd}, J=6.8,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.64$ $-2.45(\mathrm{~m}, 1 \mathrm{H}), 2.02-1.82(\mathrm{~m}, 1 \mathrm{H}), 1.82-1.49(\mathrm{~m}, 6 \mathrm{H}), 1.37-1.20(\mathrm{~m}, 1 \mathrm{H})$.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p : ~ D M S O ~ ( ~} 1.1 \mathrm{~mL}, 15 \mathrm{mmol}, 3$ equiv.) was added to a solution of $(\mathrm{COCl})_{2}(0.64$ $\mathrm{mL}, 7.5 \mathrm{mmol}, 1.5$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. After stirring for 30 min a solution of the alcohol obtained above ( $5 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was slowly added and the mixture stirred for further 2 h at the same temperature before slowly warming it to room temperature. The mixture was stirred for an additional hour and the reaction was quenched by adding a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$ and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic extract was washed with brine ( 50 mL ) and dried over $\mathrm{MgSO}_{4}$, and volatiles were removed under reduced pressure ( 400 bat at $35^{\circ} \mathrm{C}$ ) to obtain the crude compound, which was purified by silica gel flash column chromatography (hexane/ $\mathrm{Et}_{2} \mathrm{O}$ 95:5). Yellow oil. All data were consistent with those previously reported. Yield: $40 \%$ ( $400 \mathrm{mg}, 2.0 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.99(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.14-2.78(\mathrm{~m}, 1 \mathrm{H}), 2.40-1.96$ $(\mathrm{m}, 5 \mathrm{H}), 1.95-1.70(\mathrm{~m}, 5 \mathrm{H}), 1.70-1.56(\mathrm{~m}, 4 \mathrm{H})$.

[^105]
### 5.4.10. $\alpha$-Functionalization of $\alpha$-alkenyl cycloalkanones

### 5.4.10.1.General procedure

Catalyst C30 ( $11.5 \mathrm{mg}, 5 \mathrm{~mol} \%$ ) was added over a solution of the corresponding $\alpha$-alkenyl cycloalkanone 34 ( $0.15 \mathrm{mmol}, 1$ equiv.) and 1,1-bis(phenylsulfonyl)ethylene (33) ( $69 \mathrm{mg}, 0.23 \mathrm{mmol}, 1.5$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$. The resulting solution was stirred until the reaction was completed (monitored by TLC hexane/EtOAc 80:20). Then the mixture was directly submitted to a flash column chromatography (hexane/EtOAc 85:15), affording the corresponding adducts as essentially pure compound.

The racemic version of the reaction was performed following the asymmetric reaction procedure except the reaction was conducted at room temperature and TEA (20 $\mathrm{mol} \%$ ) was used as the catalyst.

### 5.4.10.2. Characterization data of compounds $\mathbf{3 5}$

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-styrylcyclohexan-1-one (35A)

The adduct was obtained according to the general procedure described above using ( $E$ )-2-styrylcyclohexan-1-one (34A) ( 30 mg , $0.15 \mathrm{mmol}, 1$ equiv.). White solid. m. p. $=92-93^{\circ} \mathrm{C}$. Yield: $91 \%$ (69 $\mathrm{mg}, 0.136 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-95.8^{\circ}\left(c=1.00,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.02-7.85(\mathrm{~m}, 2 \mathrm{H}), 7.71-7.61(\mathrm{~m}, 3 \mathrm{H}), 7.57-7.45(\mathrm{~m}$, $3 \mathrm{H}), 7.45-7.25(\mathrm{~m}, 7 \mathrm{H}), 6.42(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.12(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.56$ (t, $J$ $=4.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.18(\mathrm{dd}, J=16.6,4.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.64-2.51(\mathrm{~m}, 1 \mathrm{H}), 2.49-2.37(\mathrm{~m}, 2 \mathrm{H})$, $2.26(\mathrm{dd}, J=16.6,4.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.06-1.69(\mathrm{~m}, 5 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $211.0,138.3,137.3,136.1,134.5,134.1,132.6,130.3,130.2,129.5,128.9,128.8$,
128.3, 126.6, 80.8, 54.4, 39.7, 36.1, 31.1, 27.0, 21.3. MS: calculated for $\mathrm{C}_{28} \mathrm{H}_{32} \mathrm{NO}_{5} \mathrm{~S}_{2}$ $\left(\mathrm{M}+\mathrm{NH}_{4}{ }^{+}\right), 526.6855$; found, 526.1727 . The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol, 70:30; flux $=1$ $\mathrm{mL} / \mathrm{min}$; retention times: 17.6 min (minor), 18.9 min (major)).

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-styrylcyclopentan-1-one (35B)

35B

The adduct was obtained according to the general procedure described above using ( $E$ )-2-styrylcyclopentan-1-one (34B) ( 28 mg , $0.15 \mathrm{mmol}, 1$ equiv.) in toluene instead of dichloromethane. White solid. m. p. $=154-156^{\circ} \mathrm{C}$. Yield: $85 \%(62 \mathrm{mg}, 0.128 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=$ $-36.0^{\circ}\left(c=0.75,80 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.91-7.81(\mathrm{~m}, 4 \mathrm{H})$, $7.59(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.45-7.37(\mathrm{~m}, 4 \mathrm{H}), 7.35-7.25(\mathrm{~m}$, $5 \mathrm{H}), 6.37(\mathrm{~d}, J=16.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.93(\mathrm{~d}, J=16.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.89(\mathrm{t}, J=4.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.91$ (dd, $J=16.4,4.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.49-2.25(\mathrm{~m}, 4 \mathrm{H}), 2.23-1.87(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 218.0,140.3,138.3,137.2,136.2,134.9,134.5,134.2,131.5,129.9$, $129.5,128.9,128.6,128.0,126.7,79.5,53.7,37.9,35.1,31.4,18.7$. MS: calculated for $\mathrm{C}_{27} \mathrm{H}_{27} \mathrm{O}_{5} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 495.1300; found, 495.1299. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol, 70:30; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 15.0 min (major), 16.9 min (minor)).

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-styrylcycloheptan-1-one (35C)

The adduct was obtained according to the general procedure described above using ( $E$ )-2-styrylcycloheptan-1-one (34C) ( 32 mg , $0.15 \mathrm{mmol}, 1$ equiv.). White foam. Yield: $86 \%$ ( $67 \mathrm{mg}, 0.129$ mmol). $[\alpha]_{\mathrm{D}}{ }^{23}=-123.0^{\circ}\left(c=1.00,96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.73(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.55(\mathrm{q}, J=7.3 \mathrm{~Hz}$, $2 \mathrm{H}), 7.51-7.16(\mathrm{~m}, 9 \mathrm{H}), 6.51(\mathrm{~d}, J=16.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.14(\mathrm{~d}, J=16.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.63(\mathrm{t}, J$ $=4.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.12(\mathrm{dd}, J=16.6,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.72-2.61(\mathrm{~m}, 1 \mathrm{H}), 2.61-2.50(\mathrm{~m}, 1 \mathrm{H})$, $2.30(\mathrm{dd}, J=16.5,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.20-1.99(\mathrm{~m}, 2 \mathrm{H}), 1.68(\mathrm{dp}, J=31.2,11.0,9.1 \mathrm{~Hz}$, $5 \mathrm{H}), 1.52-1.38(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.9,138.5,137.1,136.5$, $134.5,134.0,132.4,130.5,130.1,129.5,128.9,128.8,128.7,128.0,126.7,80.5,57.0$, 41.1, 32.6, 30.2, 29.9, 26.5, 24.4. MS: calculated for $\mathrm{C}_{29} \mathrm{H}_{31} \mathrm{O}_{5} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 523.1613; found, 523.1620. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol, $50: 50$; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: $33.4 \min$ (minor), 49.5 min (major)).

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-styrylcyclooctan-1-one (35D)

The adduct was obtained according to the general procedure described above using ( $E$ )-2-styrylcyclooctan-1-one (34D) ( 34 mg , $0.15 \mathrm{mmol}, 1$ equiv.) in toluene instead of dichloromethane. White foam. Yield: $88 \%$ ( $69 \mathrm{mg}, 0.132 \mathrm{mmol}$ ). $[\alpha]_{\mathrm{D}}{ }^{23}=-87.6^{\circ}(c=1.00$, $94 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.88(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.69(\mathrm{~d}, J=$ $7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.62(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.54(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.49-7.41(\mathrm{~m}, 4 \mathrm{H}), 7.41$ $-7.26(\mathrm{~m}, 5 \mathrm{H}), 6.63(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.23(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.19(\mathrm{dd}, J=16.7$, $4.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.85-2.68(\mathrm{~m}, 1 \mathrm{H}), 2.46-2.26(\mathrm{~m}, 4 \mathrm{H}), 2.25-2.14(\mathrm{~m}, 1 \mathrm{H}), 1.87-1.62$ $(\mathrm{m}, 5 \mathrm{H}), 1.58-1.38(\mathrm{~m}, 2 \mathrm{H}), 1.25-1.07(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 214.9$, $138.4,137.3,136.4,134.4,134.0,132.8$, 130.1, 129.8, 129.5, 128.8, 128.8, 128.2, 126.7, 81.3, 56.6, 38.0, 30.0, 29.4, 26.7, 26.2, 24.7, 24.2. MS: calculated for $\mathrm{C}_{30} \mathrm{H}_{33} \mathrm{O}_{5} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 137.1769; found, 137.1766. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol, 50:50; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 20.6 min (minor), 26.5 min (major)).

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-styrylcyclohexan-1-one (35E)

The adduct was obtained according to the general procedure described above using (E)-2-(4-methoxystyryl)-4,4-dimethylcyclohexan-1-one ( $\mathbf{3 4 E}$ ) ( $39 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.). White solid. m. p. $=107^{\circ} \mathrm{C}$. Yield: $91 \% ~(69 \mathrm{mg}, 0.136 \mathrm{mmol})$. $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=+10.8^{\circ}\left(c=1.00,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}$ (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86-7.72(\mathrm{~m}, 4 \mathrm{H}), 7.66-7.51(\mathrm{~m}, 2 \mathrm{H}), 7.49$ $-7.22(\mathrm{~m}, 6 \mathrm{H}), 6.89(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.13(\mathrm{~d}, J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.98(\mathrm{~d}, J=16.7 \mathrm{~Hz}$, $1 \mathrm{H}), 4.89-4.80(\mathrm{~m}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 2.98(\mathrm{~d}, J=20.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.74-2.54(\mathrm{~m}, 1 \mathrm{H})$, 2.42 - $2.32(\mathrm{~m}, 1 \mathrm{H}), 2.32-2.21(\mathrm{~m}, 1 \mathrm{H}), 2.13(\mathrm{~d}, J=14.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.75(\mathrm{~d}, J=14.2$ $\mathrm{Hz}, 1 \mathrm{H}), 1.68(\mathrm{dd}, J=9.1,4.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.16(\mathrm{~s}, 3 \mathrm{H}), 1.06(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 212.0,159.6,138.3,134.1,134.1,130.8,130.3,129.7,129.7,129.1,128.8$, $128.8,127.7,114.2,80.9,55.3,52.5,51.0,38.3,36.3,33.0,32.1,30.9,27.3$. MS: calculated for $\mathrm{C}_{31} \mathrm{H}_{35} \mathrm{O}_{6} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 567.1875 ; found, 567.1882. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol, 70:30; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 16.7 min (minor), 23.2 $\min$ (major)).

## (R,E)-2-(2,2-bis(Phenylsulfonyl)ethyl)-2-(2-methylprop-1-en-1-yl)cyclohexan-1-one (35F)

The adduct was obtained according to the general procedure described above using 2-(2-methylprop-1-en-1-yl)cyclohexan-1one ( $\mathbf{3 4 F}$ ) ( $23 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.). Colourless oil. Yield: $84 \% ~(58 \mathrm{mg}, 0.126 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-36.1^{\circ}(c=1.00,61 \% \mathrm{ee}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.94(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.85(\mathrm{~d}, J=7.2 \mathrm{~Hz}$, $1 \mathrm{H}), 7.69-7.58(\mathrm{~m}, 1 \mathrm{H}), 7.56-7.47(\mathrm{~m}, 3 \mathrm{H}), 5.00(\mathrm{~s}, 0 \mathrm{H}), 4.96(\mathrm{dd}, J=5.3,3.2 \mathrm{~Hz}$, $1 \mathrm{H}), 2.81(\mathrm{dd}, J=16.2,5.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.59-2.47(\mathrm{~m}, 1 \mathrm{H}), 2.37(\mathrm{dd}, J=16.2,3.2 \mathrm{~Hz}$, $1 \mathrm{H}), 2.32-2.20(\mathrm{~m}, 1 \mathrm{H}), 2.19-2.12(\mathrm{~m}, 2 \mathrm{H}), 2.06-1.96(\mathrm{~m}, 1 \mathrm{H}), 1.56(\mathrm{~s}, 2 \mathrm{H}), 1.52$ (s, 2H). ${ }^{13}$ C NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 220.6,138.7,138.2,137.6,134.5,134.1,129.9$, $129.5,129.0,128.9,124.9,79.1,51.7,38.8,37.4,31.0,27.1,19.8,18.7$. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{29} \mathrm{O}_{5} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 461.6105; found, 461.6100. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak AD-H, hexane/isopropanol, 70:30; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 9.3 min (minor), 10.4 min (major)).

### 5.4.11. Elaboration of adducts 35

### 5.4.11.1.Synthesis of $\mathbf{3 8}$ and $\mathbf{3 9}$

Ketals $\mathbf{3 8}$ and $\mathbf{3 9}$ were prepared according to the following synthetic sequence:

## Step 1: Protection of the ketone moiety (36 and 37)

The above obtained ketone 35 ( 0.25 mmol , 1 equiv.), etylenglycol ( $60 \mu \mathrm{~L}, 1.0$ mmol, 4 equiv.) and triethyl orthoformate ( $80 \mu \mathrm{~L}, 0.50 \mathrm{mmol}, 2$ equiv.) were dissolved in 1,2-DCE ( 0.6 mL ) and camphorsulphonic acid ( $16 \mathrm{mg}, 0.07 \mathrm{mmol}, 0.28$ equiv.) was added. The resulting solution was stirred at $70{ }^{\circ} \mathrm{C}$ overnight before being directly submitted to silica gel flash column chromatography (hexane/EtOAc 80:20).

## (R,E)-6-(2,2-bis(Phenylsulfonyl)ethyl)-6-styryl-1,4-dioxaspiro[4.5]decane (36)

The ketal was obtained from adduct 35A ( $125 \mathrm{mg}, 0.25 \mathrm{mmol}, 1$ equiv.) following the procedure described above. White solid. m. p. $=67-69^{\circ} \mathrm{C}$. Yield: $98 \%(135 \mathrm{mg}, 0.244 \mathrm{mmol}) \cdot[\alpha]_{\mathrm{D}}{ }^{23}=-69.0^{\circ}(c=$ $1.00,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.05-7.99$ $(\mathrm{m}, 2 \mathrm{H}), 7.72-7.65(\mathrm{~m}, 1 \mathrm{H}), 7.60-7.52(\mathrm{~m}, 4 \mathrm{H}), 7.50-7.44(\mathrm{~m}, 3 \mathrm{H}), 7.42-7.34(\mathrm{~m}$, $2 \mathrm{H}), 7.29$ (d, $J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.20-7.12(\mathrm{~m}, 2 \mathrm{H}), 6.37(\mathrm{~d}, J=4.4 \mathrm{~Hz}, 3 \mathrm{H}), 4.43(\mathrm{t}, J=$ $4.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.04-3.80(\mathrm{~m}, 4 \mathrm{H}), 2.79(\mathrm{dd}, J=16.2,4.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.34(\mathrm{dd}, J=16.2,4.0$ $\mathrm{Hz}, 2 \mathrm{H}), 2.05(\mathrm{~d}, J=14.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.82-1.43(\mathrm{~m}, 7 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 138.9, 137.6, 137.3, 134.7, 134.1, 132.3, 131.2, 130.8, 129.6, 129.0, 128.9, 128.9, 127.9, 126.8, 111.7, 81.4, 65.2, 65.1, 49.5, 32.5, 30.4, 27.9, 23.5, 21.0. MS: calculated for $\mathrm{C}_{30} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{NH}_{4}{ }^{+}\right), 570.7385$; found, 570.1994.

## (R,E)-6-(2,2-bis(Phenylsulfonyl)ethyl)-6-(4-methoxystyryl)-8,8-dimethyl-1,4dioxaspiro[4.5]decane (37)

The ketal was obtained from adduct 35E ( $283 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) following the procedure described above. White solid. m. p. $=90-93{ }^{\circ} \mathrm{C}$. Yield: $90 \%(274 \mathrm{mg}, 0.45 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-45.9(c$ $\left.=1.00,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.85(\mathrm{~d}$, $J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.70(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.61-7.45(\mathrm{~m}, 2 \mathrm{H})$, $7.41(\mathrm{t}, J=7.6 \mathrm{~Hz}, 4 \mathrm{H}), 7.29(\mathrm{t}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}), 6.92(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.63(\mathrm{~d}, J=$ $16.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.22(\mathrm{~d}, J=16.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.77(\mathrm{t}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.15-3.85(\mathrm{~m}, 4 \mathrm{H})$, $3.80(\mathrm{~s}, 3 \mathrm{H}), 2.82(\mathrm{dd}, J=16.3,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.19(\mathrm{dd}, J=16.3,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.83-1.43$ $(\mathrm{m}, 5 \mathrm{H}), 1.29-1.18(\mathrm{~m}, 1 \mathrm{H}), 0.97(\mathrm{~s}, 3 \mathrm{H}), 0.91(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $159.0,140.2,138.4,137.9,134.7,134.0,133.7$, 130.8, 130.2, 129.9, 129.6, 129.6, $128.5,128.4,128.2,127.5,113.9,111.7,81.3,64.1,63.7,55.1,48.0,45.7,36.1,33.9$, 30.8, 29.4, 28.2, 27.8. MS: calculated for $\mathrm{C}_{33} \mathrm{H}_{39} \mathrm{O}_{7} \mathrm{~S}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 611.2137; found, 611.2125.

## Step 2: Desulfonylation of ketals 36 and 37 to afford 38 and 39

The above obtained ketal ( $0.25 \mathrm{mmol}, 1$ equiv.) was dissolved in $\mathrm{MeOH}(2 \mathrm{~mL}$ ) and magnesium powder ( $61 \mathrm{mg}, 2.5 \mathrm{mmol}, 10$ equiv.) was added. The resulting suspension was cooled to $0{ }^{\circ} \mathrm{C}$ and a drop of trimethylsilylchloride and a drop of 1,2dibromoethane were added. The resulting mixture was warmed to room temperature observing the formation of hydrogen, and the reaction was followed by TLC (hexane/EtOAc 80:20). After completion of the reaction the mixture was filtered
through a pad of celite and washed with MeOH . The solvent was eliminated under reduced pressure and the residue was dissolved in dichloromethane ( 10 mL ). The organic solution was washed with water ( $2 \times 10 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$, volatiles were removed under reduced pressure to obtain crude compound which was purified by silica gel flash column chromatography (hexane/EtOAc 95:5).

## (R,E)-6-Ethyl-6-styryl-1,4-dioxaspiro[4.5]decane (38)

The product was obtained from 36 ( $138 \mathrm{mg}, 0.25 \mathrm{mmol}, 1$ equiv.) following the procedure described above as a colourless oil. Yield: $56 \%$ $(38 \mathrm{mg}, 0.14 \mathrm{mmol}) .[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=-16.2^{\circ}\left(c=0.80,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H})$, $7.19(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.34(\mathrm{~d}, J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.23(\mathrm{~d}, J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.03-$ 3.82 (m, 4H), $1.94-1.82(\mathrm{~m}, 1 \mathrm{H}), 1.74-1.51(\mathrm{~m}, 8 \mathrm{H}), 1.51-1.38(\mathrm{~m}, 1 \mathrm{H}), 0.74$ (t, $J=$ $7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 138.9,134.4,130.3,129.1,128.8,127.4$, 126.7, 126.1, 113.3, 65.9, 65.6, 49.0, 32.7, 29.8, 25.7, 24.2, 21.3, 8.4. MS: calculated for $\mathrm{C}_{18} \mathrm{H}_{25} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 273.3955; found, 273.1722.

## (S,E)-6-Ethyl-6-(4-methoxystyryl)-8,8-dimethyl-1,4-dioxaspiro[4.5]decane (39)

The product was obtained from 37 ( $270 \mathrm{mg}, 0.40 \mathrm{mmol}, 1$ equiv.) following the procedure described above. Colourless oil. Yield: $53 \% ~(70 \mathrm{mg}, 0.21 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{26}=-13.7^{\circ}(c=0.50,92 \% e e$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.33(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H})$, $6.86(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.40(\mathrm{~d}, J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.12(\mathrm{~d}, J=$ $16.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.09-3.89(\mathrm{~m}, 4 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 1.78-1.59(\mathrm{~m}, 5 \mathrm{H}), 1.59-1.41(\mathrm{~m}$, $3 \mathrm{H}), 1.04(\mathrm{~s}, 3 \mathrm{H}), 1.01(\mathrm{~s}, 3 \mathrm{H}), 0.82(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $158.5,132.8,129.4,128.5,127.0,113.8,64.8,64.7,55.2,47.8,43.5,36.4,31.4,30.6$, 30.5, 28.9, 27.5, 8.2.

### 5.4.11.2.Synthesis of compound 41

Ketone 41 was synthesised from ketal 36 according to the following synthetic sequence:

$1^{\text {st }}$ step: Sodium hydride ( $60 \%$ wt in oil) ( 9.5 mg ) was added to a solution of the above obtained ketal 58 ( $116 \mathrm{mg}, 0.20 \mathrm{mmol}, 1$ equiv.) in dry DMF $(0.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was stirred at room temperature for 30 min and was recooled to $0^{\circ} \mathrm{C}$ to slowly add iodomethane ( $75 \mu \mathrm{~L}, 0.6 \mathrm{mmol}, 3$ equiv.). The resulting solution mas stirred overnight at $40^{\circ} \mathrm{C}$. The reaction was quenched by adding a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}$, and the resulting aqueous phase was extracted with EtOAc ( $3 \times 3 \mathrm{~mL}$ ). The combined organic layer was washed with brine ( $5 \times 5 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$, and volatiles were removed under reduced pressure to obtain crude compound which was purified by silica gel flash column chromatography (hexane/EtOAc 80:20) obtaining product 62 as a white foam. Yield: $86 \%(99 \mathrm{mg}, 0.172 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{25}=-59.3^{\circ}(c=1.00,98 \% e e$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.08(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.91(\mathrm{~d}, J=7.3 \mathrm{~Hz}$, 2H), $7.75-7.45(\mathrm{~m}, 6 \mathrm{H}), 7.25(\mathrm{dt}, J=24.9,7.6 \mathrm{~Hz}, 5 \mathrm{H}), 6.46-6.26(\mathrm{~m}, 1 \mathrm{H}), 5.90(\mathrm{~d}, J$ $=16.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.99-3.72(\mathrm{~m}, 4 \mathrm{H}), 2.34-2.20(\mathrm{~m}, 1 \mathrm{H}), 1.96(\mathrm{dt}, J=14.0,6.7 \mathrm{~Hz}$, $1 \mathrm{H}), 1.88(\mathrm{~s}, 3 \mathrm{H}), 1.69-1.48(\mathrm{~m}, 8 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.4,136.8$, $136.1,134.2,132.3,131.8,131.5,128.6,128.4,128.4,127.2,126.1,112.3,89.8,64.8$, 49.2, 31.3, 31.1, 23.1, 20.9, 16.4.
$2^{\text {nd }}$ step: The methylated adduct $40(142 \mathrm{mg}, 0.25 \mathrm{mmol})$ was submitted to the desulfonylation procedure described above (Section 5.4.11.1), and the resulting ketal was dissolved in a mixture of THF ( 0.5 mL ) and aqueous $\mathrm{HCl}(6 \mathrm{M})(0.5 \mathrm{~mL})$ and stirred at room temperature overnight. THF was eliminated under reduced pressure and the remaining aqueous phase was extracted with dichloromethane ( $3 \times 2 \mathrm{~mL}$ ). The combined organic layer was dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to obtain crude compound $\mathbf{4 1}$, which was purified by silica gel flash column chromatography (hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2} 60: 40$ ). ### 5.4.11.3.Preparation of $\beta$-ketoester 43

Known $\beta$-ketoester $\mathbf{4 3}^{269}$ was synthesised according to the following synthetic sequence:

$1^{\text {st }}$ step: ${ }^{270}$ Alkene $\mathbf{3 8}$ ( $68 \mathrm{mg}, 0.25 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of tertbutanol ( 3 mL ) and water ( 1 mL ) and citric acid ( $72 \mathrm{mg}, 0.75 \mathrm{mmol}, 3$ equiv.). To the resulting solution $N$-methylmorpholine $N$-oxide ( $136 \mathrm{mg}, 0.75 \mathrm{mmol}, 3$ equiv.) and osmium tetraoxide ( $2.5 \mathrm{wt} \%$ in ${ }^{\mathrm{t}} \mathrm{BuOH}$ ) ( $0.6 \mathrm{~mL}, 0.05 \mathrm{mmol}, 0.2$ equiv.) were added and the reaction mixture was stirred at $55^{\circ} \mathrm{C}$ for 24 h . Part of the solvent was eliminated under reduced pressure and the aqueous phase was extracted with dichloromethane ( 3 x 2 mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to obtain the crude compound which was purified by silica gel flash column chromatography (hexane/EtOAc 85:15). The desired diol $\mathbf{4 2}$ was obtained as a mixture of two isomers at a $1: 1$ ratio. Yield: $52 \% ~(40 \mathrm{mg}, 0.13 \mathrm{mmol}$ ).
$\mathbf{2}^{\text {nd }}$ step: ${ }^{271}$ The diol 42 obtained in the previous step ( $37 \mathrm{mg}, 0.12 \mathrm{mmol}, 1$ equiv.) was dissolved in a 2:2:3 mixture of $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{CCl}_{4}$ and $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$ and sodium metaperiodate ( $205 \mathrm{mg}, 0.96 \mathrm{mmol}, 8$ equiv.) and ruthenium(III) chloride ( $0.6 \mathrm{mg}, 2.5$ $\mathrm{mol} \%$ ) were added. The resulting mixture was vigorously stirred for 2.5 h before being diluted with dichloromethane ( 2 mL ). The layers were separated and the aqueous phase was extracted with dichloromethane ( $3 \times 2 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure. The crude obtained was dissolved in dry DMF ( 1.6 mL ) and potassium carbonate ( $66 \mathrm{mg}, 0.48$ mmol, 4 equiv.) was added. The mixture was stirred for 30 min at room temperature before adding iodomethane ( $0.10 \mathrm{~mL}, 0.72 \mathrm{mmol}, 6$ equiv.) and letting to stir overnight. The mixture was poured over $\mathrm{HCl}(1 \mathrm{M})$ and diethylether and the aqueous layer was extracted with diethylether ( $5 \times 2 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( $10 \times 2 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure. The reaction crude was then redissolved in methanol ( 3.6 mL ) and aqueous

[^106]$\mathrm{HCl}(3 \mathrm{M})(0.7 \mathrm{~mL})$ was added. The resulting solution was stirred at room temperature overnight and diluted with an aqueous solution of $\mathrm{NaHCO}_{3}(5 \%)$. The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 5 \mathrm{~mL})$ and the combined organic layers were washed with brine ( $10 \times 2 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to obtain the crude ketoester 63, which was purified by silica gel flash column chromatography (hexane/EtOAc 97:3). All data were consistent with those previously reported. Yield: $45 \%$ ( $10 \mathrm{mg}, 0.054 \mathrm{mmol}$ ). The absolute configuration of the molecule was determined by comparison of the $[\alpha]$ value. ${ }^{272}[\boldsymbol{\alpha}] \mathbf{D}^{23}=-91.3^{\circ}(c=0.08,98 \% e e$, $\mathrm{EtOH}),\left([\alpha]_{\mathrm{D}}{ }^{20} \mathrm{Lit}^{272}=-82.4^{\circ}(c=5.7, \mathrm{EtOH}) .{ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.73(\mathrm{~s}\right.$, $3 \mathrm{H}), 2.56-2.39(\mathrm{~m}, 3 \mathrm{H}), 2.06-1.87(\mathrm{~m}, 2 \mathrm{H}), 1.78-1.52(\mathrm{~m}, 4 \mathrm{H}), 1.50-1.37(\mathrm{~m}$, $1 \mathrm{H}), 0.84(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 208.0,172.5,61.3,52.2$, 41.2, 35.5, 29.7, 27.6, 22.5, 8.8. MS: calculated for $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{O}_{3}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 185.1178; found, 185.1183.

### 5.4.11.4.Preparation of cycloalkanone 45

$\alpha, \alpha$-Dialkyl cycloalkanone 45 was synthesised according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: Ketal 38 obtained above ( $16 \mathrm{mg}, 0.6 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of THF ( 0.5 mL ) and aqueous $\mathrm{HCl}(6 \mathrm{M})(0.5 \mathrm{~mL})$ and stirred at room temperature overnight. THF was eliminated under reduced pressure and the remaining aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 2 \mathrm{~mL})$. The combined organic layer was dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to obtain the desired ketone 44 as an essentially pure liquid compound. Yield: $89 \%$ ( $12.2 \mathrm{mg}, 0.053$ mmol). [ $\boldsymbol{\alpha} \mathbf{D}^{\mathbf{2} 3}=-30.3^{\circ}\left(c=0.50,98 \% ~ e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.40$ $-7.27(\mathrm{~m}, 4 \mathrm{H}), 7.26-7.22(\mathrm{~m}, 1 \mathrm{H}), 6.30(\mathrm{~d}, J=3.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.62-2.47(\mathrm{~m}, 1 \mathrm{H}), 2.42$ - $2.29(\mathrm{~m}, 1 \mathrm{H}), 2.14-2.04(\mathrm{~m}, 1 \mathrm{H}), 1.99-1.59(\mathrm{~m}, 7 \mathrm{H}), 0.84(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$

[^107]NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 213.2,137.1,133.2,130.6,128.6,127.5,126.1,54.8,39.6$, 36.0, 30.3, 27.3, 21.6, 8.2.
$\mathbf{2}^{\text {nd }} \boldsymbol{s t e p :}$ The previously obtained desulfonylated product $\mathbf{4 4}(11 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) and palladium on activated charcoal ( $10 \% \mathrm{wt}$.) ( $20 \% \mathrm{wt}, 2.2 \mathrm{mg}$ ) were stirred under an hydrogen atmosphere at 30 bar overnight. The resulting suspension was filtered over a pad of celite and the solvent was eliminated under reduced pressure. The $\alpha, \alpha$-dialkyl cycloalkanone $\mathbf{4 5}$ was purified by silica gel flash column chromatography (hexane/EtOAc 95:5). Colourless oil. Yield: $81 \%$ ( $9.3 \mathrm{mg}, 0.040 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=-19.6^{\circ}$ ( $c=0.25,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.31-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.23-$ $7.12(\mathrm{~m}, 3 \mathrm{H}), 2.53(\mathrm{td}, J=12.9,5.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.44-2.27(\mathrm{~m}, 3 \mathrm{H}), 1.99-1.69(\mathrm{~m}, 9 \mathrm{H})$, $1.65-1.51(\mathrm{~m}, 1 \mathrm{H}), 0.82(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C} \mathbf{N M R}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 215.3$, 142.7, 128.4, 128.3, 125.8, 51.7, 39.2, 36.4, 36.1, 30.0, 27.2, 27.0, 20.8, 7.8. ### 5.4.11.5.Synthesis of hemiketal 46 and diastereopure diol 42

Compound 42 was prepared in a diastereopure manner according to the following synthetic sequence:

1st step: ${ }^{270}$ Compound 44 ( $62 \mathrm{mg}, 0.25 \mathrm{mmol}, 1$ equiv.) was dissolved in a mixture of tert-butanol ( 36 mL ) and $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{~mL})$ and citric acid ( $72 \mathrm{mg}, 0.75 \mathrm{mmol}, 3$ equiv.). To the resulting solution $N$-methylmorpholine $N$-oxide ( $136 \mathrm{mg}, 0.75 \mathrm{mmol}, 3$ equiv.) and osmium tetraoxide ( $2.5 \mathrm{wt} \%$ in ${ }^{\mathrm{t}} \mathrm{BuOH}$ ) ( $1.2 \mathrm{~mL}, 0.1 \mathrm{mmol}, 0.2$ equiv.) were added and the reaction mixture was stirred at $55^{\circ} \mathrm{C}$ for 24 h . Part of the solvent was eliminated under reduced pressure and the aqueous phase was extracted with dichloromethane ( 3 x 2 mL ). The combined organic layer was dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to obtain the crude compound which was purified by silica gel flash column chromatography (hexane/EtOAc 85:15). The hemiketal 46 was obtained as a single diastereomer and its structure was confirmed by X-ray analysis. Yield: 60\% ( $38 \mathrm{mg}, 0.150 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{26}=-18.1^{\circ}\left(c=1.00,98 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ ). ${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.51-7.34(\mathrm{~m}, 4 \mathrm{H}), 7.34-7.24(\mathrm{~m}, 1 \mathrm{H}), 5.49(\mathrm{~d}, J=4.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.99(\mathrm{~d}, J$ $=2.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.12-1.78(\mathrm{~m}, 3 \mathrm{H}), 1.70(\mathrm{~d}, J=4.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.66-1.17(\mathrm{~m}, 8 \mathrm{H}), 0.96$
$(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 138.2,128.6,127.7$, 126.7, 107.7 , 83.3, 79.1, 51.9, 31.9, 27.2, 22.5, 20.6, 18.8, 8.9. MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{O}_{2}$ (M -$\mathrm{OH}^{-}$), 245.1536; found, 245.1551.
$2^{\text {nd }}$ step: Diol 42 was obtained following the acetalization procedure described above (Section 5.4.11.1) starting from the hemiketal 46 obtained in the previous step ( 25 mg , $0.10 \mathrm{mmol})$. White foam. Yield: $96 \%(29 \mathrm{mg}, 0.096 \mathrm{mmol}) .[\alpha] \mathbf{D}^{25}=+20.1^{\circ}(c=0.50$, $98 \%$ ee, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.41$ - $7.19(\mathrm{~m}, 5 \mathrm{H}), 5.54(\mathrm{~d}, J=4.7$ $\mathrm{Hz}, 1 \mathrm{H}$ ), $4.04-3.87$ (m, 2H), $3.73-3.61$ (m, 3H), 2.80 (d, $J=10.7 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.35-$ $2.21(\mathrm{~m}, 1 \mathrm{H}), 2.08-1.95(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{~d}, J=13.3 \mathrm{~Hz}, 2 \mathrm{H}), 1.74-1.67(\mathrm{~m}, 1 \mathrm{H}), 1.62$ $-1.50(\mathrm{~m}, 2 \mathrm{H}), 1.49-1.36(\mathrm{~m}, 3 \mathrm{H}), 1.32-1.20(\mathrm{~m}, 2 \mathrm{H}), 0.98(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 139.1,128.0,126.9,126.4,83.6,79.0,62.1,61.7,52.7,28.7$, 27.9, 22.7, 20.6, 18.8, 8.7. MS: calculated for $\mathrm{C}_{18} \mathrm{H}_{27} \mathrm{O}_{5}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 307.1904; found, 307.1917.

### 5.4.11.6.Synthesis of cycloalkanone 48

$\alpha, \alpha$-Dialkyl cycloalkanone 48 was synthesised according to the following synthetic sequence:

$1^{\text {st }}$ step: The previously obtained desulfonylated compound 39 ( $70 \mathrm{mg}, 0.20 \mathrm{mmol}, 1$ equiv.) and palladium on activated charcoal ( $10 \% \mathrm{wt}$.) ( $20 \% \mathrm{wt}, 14 \mathrm{mg}$ ) were stirred under an hydrogen atmosphere at 30 bar overnight. The resulting suspension was filtered over a pad of celite and the solvent was eliminated under reduced pressure. Product 47 was purified by silica gel flash column chromatography (hexane/EtOAc 95:5). White foam. Yield: $75 \%(51 \mathrm{mg}, 0.15 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-18.0^{\circ}(c=0.50,92 \% e e$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.11(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.82(\mathrm{~d}, J=8.6 \mathrm{~Hz}$, 2H), $4.03-3.89$ (m, 4H), 3.79 (s, 3H), $2.60-2.47$ (m, 2H), $1.98-1.73$ (m, 2H), $1.71-$ $1.39(\mathrm{~m}, 6 \mathrm{H}), 1.36(\mathrm{~s}, 2 \mathrm{H}), 1.01(\mathrm{~s}, 6 \mathrm{H}), 0.95(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 157.5,136.0,129.1,113.7,64.1,55.2,46.2,43.6,36.4,35.8,31.3,30.6,30.5$, 29.7, 27.8, 25.6, 8.8.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{273}$ The product above obtained ( $40 \mathrm{mg}, 0.12 \mathrm{mmol}, 1$ equiv.) was dissolved in a 2:2:3 mixture of $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{CCl}_{4}$ and $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$, and sodium metaperiodate ( 107 mg , $1.2 \mathrm{mmol}, 10$ equiv.) and ruthenium(III) chloride ( $0.6 \mathrm{mg}, 2.5 \mathrm{~mol} \%$ ) were added. The resulting mixture was vigorously stirred for 2.5 h before being diluted with dichloromethane ( 2 mL ). The layers were separated and the aqueous phase was extracted with dichloromethane ( $3 \times 2 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure. The residue was then dissolved in a mixture of THF ( 0.5 mL ) and aqueous $\mathrm{HCl}(6 \mathrm{M})(0.5 \mathrm{~mL})$ and stirred at room temperature overnight. THF was eliminated under reduced pressure and the remaining aqueous phase was extracted with dichloromethane ( $3 \times 2 \mathrm{~mL}$ ). The combined organic layer was dried over $\mathrm{MgSO}_{4}$ and volatiles were removed under reduced pressure to afford the desired ketone 48. Yield: $56 \%(15.2 \mathrm{mg}, 0.067 \mathrm{mmol})$. $[\alpha]_{\mathrm{D}}{ }^{25}=+8.2^{\circ}\left(c=1.00,92 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.49-2.32$ $(\mathrm{m}, 2 \mathrm{H}), 2.32-2.13(\mathrm{~m}, 2 \mathrm{H}), 1.95-1.74(\mathrm{~m}, 2 \mathrm{H}), 1.74-1.62(\mathrm{~m}, 3 \mathrm{H}), 1.62-1.48(\mathrm{~m}$, $3 \mathrm{H}), 1.09(\mathrm{~s}, 3 \mathrm{H}), 1.05(\mathrm{~s}, 3 \mathrm{H}), 0.78(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 216.1, 179.4, 49.8, 47.6, 37.3, 35.7, 30.6, 30.6, 30.3, 30.0, 29.4, 28.9, 8.0. MS: calculated for $\mathrm{C}_{13} \mathrm{H}_{23} \mathrm{O}_{3}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 227.1647; found, 227.1658.

### 5.4.12. General procedure for the synthesis of rac $\mathbf{1}$-substituted $\boldsymbol{\beta}$-tetralones 49

New $\beta$-tetralones 49B-H where synthesised following the procedure previously reported by McNally. ${ }^{274}$ 49A was commercially available.

[^108]Pyrrolidine ( $0.46 \mathrm{~mL}, 6 \mathrm{~mL}, 1.2$ equiv.) was added to a solution of the corresponding $\beta$-tetralone ( $5 \mathrm{mmol}, 1$ equiv.) in MeOH under argon and the resulting mixture was stirred for 1 h at room temperature, observing the precipitation of the enamine. The solvent was evaporated and 1,2-dichloroethane ( 10 mL ) was added and evaporated to eliminate the excess pyrrolidine. The residue was dissolved in acetonitrile $(10 \mathrm{~mL})$ and the corresponding bromide ( $6 \mathrm{mmol}, 1.2$ equiv.) was added. The resulting solution was stirred at room temperature for 5 h and the solvent was eliminated under reduced pressure. The obtained crude was dissolved in a mixure of dichloromethane (7 $\mathrm{mL})$, water ( 7 mL ), methanol ( 15 mL ) and acetic acid ( 1 mL ) and the mixture was stirred at room temperature overnight. The layers were separated and the aqueous phase was extracted with dichloromethane ( 3 x 5 mL ). The combined organic phases were washed with brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure. The corresponding products were purified by flash column chromatography (hexane/EtOAc 90:10).

## 1-Benzyltetralone (49B)

The adduct was obtained following the general procedure. Yellow oil. Yield: $68 \%$ ( $803 \mathrm{mg}, 3.4 \mathrm{mmol}$ ). The spectral data was coincidental with the one described in the literature. ${ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.22-7.08(\mathrm{~m}, 6 \mathrm{H}), 6.99-6.86(\mathrm{~m}, 3 \mathrm{H}), 3.74(\mathrm{t}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.23$ (d, $J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.21(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.90-2.75(\mathrm{~m}, 1 \mathrm{H}), 2.69-2.39(\mathrm{~m}, 3 \mathrm{H})$. ${ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 212.2,138.1,136.9,136.4,129.4,128.5,128.1,127.6$, 126.8, 126.6, 126.4, 55.0, 39.0, 38.3, 27.2.

## 1-(3-Methylbut-2-en-1-yl)-tetralone (49C)

The adduct was obtained following the general procedure. Yellow oil. Yield: $82 \%$ ( $879 \mathrm{mg}, 4.1 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.24-$ $7.11(\mathrm{~m}, 1 \mathrm{H}), 5.06(\mathrm{~m}, 1 \mathrm{H}), 3.43(\mathrm{t}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.15(\mathrm{~m}, 1 \mathrm{H})$, 49C $3.01(\mathrm{~m}, 1 \mathrm{H}), 2.59(\mathrm{~m}, 4 \mathrm{H}), 1.65(\mathrm{~s}, 3 \mathrm{H}), 1.45(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.5,137.2,136.6,134.3,128.3,127.8,126.8,126.7,120.5,53.8$, 37.9, 30.8, 27.9, 25.8, 17.7. MS: calculated for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 215.1436; found, 215.1433.

## 2-(2-Oxo-1,2,3,4-tetrahydronaphthalen-1-yl)acetonitrile (49D)

The adduct was obtained following the general procedure. Yellow oil. Yield: $43 \% ~(394 \mathrm{mg}, 2.1 \mathrm{mmol}){ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.37-$ $7.24(\mathrm{~m}, 1 \mathrm{H}), 3.85-3.80(\mathrm{~m}, 0 \mathrm{H}), 3.15-2.98(\mathrm{~m}, 1 \mathrm{H}), 2.80-2.70(\mathrm{~m}$, 0 H ), 2.53 (ddd, $J=17.6,8.7,6.2 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $(75 \mathrm{MHz}$,
$\left.\mathrm{CDCl}_{3}\right) \delta$ 207.7, 137.3, 133.1, 128.2, 128.0, 127.7, 125.8, 118.3, 48.9, 37.2, 27.9, 16.9. MS: calculated for $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 185.0966; found, 185.0958.

## 1-(Prop-2-yn-1-yl)-tetralone (49E)

The adduct was obtained following the general procedure. Yellow oil. Yield: $70 \%$ ( $645 \mathrm{mg}, 3.5 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39-$ $7.23(\mathrm{~m}, 4 \mathrm{H}), 3.64(\mathrm{~m}, 1 \mathrm{H}), 3.16-3.06(\mathrm{~m}, 1 \mathrm{H}), 3.01-2.78(\mathrm{~m}, 1 \mathrm{H})$, $2.73-2.50(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 209.9,137.3,135.3$, 127.8, 127.2, 127.2, 127.1, 81.7, 70.4, 51.5, 37.8, 27.9, 19.4. MS: calculated for $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 185.0966; found, 185.0958.

## 1-Benzyl-6-chlorotetralone (49F)

The adduct was obtained following the general procedure. Yellow oil. Yield: $56 \%(758 \mathrm{mg}, 2.8 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 7.20-7.15(\mathrm{~m}, 3 \mathrm{H}), 7.15-7.10(\mathrm{~m}, 2 \mathrm{H}), 6.87(\mathrm{dd}, J=6.4,3.1 \mathrm{~Hz}$, $2 \mathrm{H}), 6.82(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.70(\mathrm{t}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.22-3.16$ $(\mathrm{m}, 2 \mathrm{H}), 2.83-2.74(\mathrm{~m}, 1 \mathrm{H}), 2.62-2.54(\mathrm{~m}, 1 \mathrm{H}), 2.53-2.40(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13}$ C NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 211.4,138.6,137.7,134.9,132.5,130.0,129.3,128.2,127.7$, 126.7, 126.6, 54.5, 39.2, 37.9, 27.0. MS: calculated for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{OCl}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 271.0890; found, 271.0895 .

6-Methoxy-1-(3-methylbut-2-en-1-yl)-tetralone (49G)

The adduct was obtained following the general procedure. Yellow oil. Yield: $46 \% ~(561 \mathrm{mg}, 2.3 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.86-6.65(\mathrm{~m}, 2 \mathrm{H}), 5.04(\mathrm{t}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H})$, $3.79(\mathrm{~s}, 3 \mathrm{H}), 3.36(\mathrm{t}, J=6.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.17-3.02(\mathrm{~m}, 1 \mathrm{H}), 3.02-$ $2.87(\mathrm{~m}, 1 \mathrm{H}), 2.67-2.40(\mathrm{~m}, 4 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}), 1.45(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.5,158.2,137.7,134.0,129.1,120.5,113.1,112.1,55.2$, 52.9, 37.7, 30.8, 28.0, 25.6, 17.6. MS: calculated for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 231.1385; found, 231.1372.

## 1-Benzyl-7-methoxytetralone (49H)

The adduct was obtained following the general procedure. Yellow oil. Yield: $60 \%$ ( $799 \mathrm{mg}, 3.0 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.25-7.10(\mathrm{~m}, 4 \mathrm{H}), 7.05(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H})$, 6.92 (dd, $J=6.6,2.9 \mathrm{~Hz}, 2 \mathrm{H}), 6.73(\mathrm{dd}, J=8.3,2.6 \mathrm{~Hz}, 1 \mathrm{H})$, $6.40(\mathrm{~d}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.66(\mathrm{~s}, 3 \mathrm{H}), 3.29-3.08(\mathrm{~m}, 2 \mathrm{H}), 2.87-2.73(\mathrm{~m}, 1 \mathrm{H}), 2.69-2.35$ (m, 3H). ${ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.2,158.2,138.1,137.5,129.4,128.8,128.6$,
128.1, 126.4, 113.6, 112.7, 55.2, 39.1, 38.5, 26.4. MS (ESI, m/z): calculated for $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right), 167.1385$; found, 167.1392.

### 5.4.13. Preparation of chroman-3-ones 53 and 65

## 8-Methoxychroman-3-one (53)

The title compound was synthesised according to the following synthetic sequence as described in the literature: ${ }^{275}$

1) $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{N}_{3} . \mathrm{Et}_{3} \mathrm{~N}$
$\mathrm{CH}_{2} \mathrm{Cl}_{2}$ / toluene
$50^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$
2) $85^{\circ} \mathrm{C}, 2.5 \mathrm{~h}$
3) HCl (aq.), $100^{\circ} \mathrm{C}, 16 \mathrm{~h}$

$1^{\text {st }}$ step: $o$-Vanilin ( $1.5 \mathrm{~mL}, 10 \mathrm{mmol}, 1$ equiv.), acrylonitrile ( $3.28 \mathrm{~mL}, 50 \mathrm{mmol}, 5$ equiv.) and DABCO ( $247 \mathrm{mg}, 2.2 \mathrm{mmol}, 0.22$ equiv.) were stirred for 24 h at $90^{\circ} \mathrm{C}$ and the course of the reaction was followed by TLC on silica (hex: $\mathrm{CH}_{2} \mathrm{Cl}_{2} 70: 30$ ). After the aldehyde disappeared. the reaction mixture was cooled to room temperature and concentrated under reduced pressure. The crude mixture was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (30 mL ) and washed with a saturated solution of $\mathrm{NaHCO}_{3}$ and brine. The organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure, affording the crude nitrile, which was purified by column chromatography on silica gel (hexane/EtOAc $80: 20)$. Yield: $67 \%(1.0 \mathrm{~g}, 6.7 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.17(\mathrm{t}, J=1.3$ $\mathrm{Hz}, 1 \mathrm{H}), 6.94(\mathrm{~d}, J=1.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.92(\mathrm{~s}, 1 \mathrm{H}), 6.74(\mathrm{dd}, J=5.1,4.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.87(\mathrm{~d}, J$ $=1.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.88(\mathrm{~s}, 3 \mathrm{H})$.
$2^{\text {nd }}$ step: An aqueous solution of $\mathrm{NaOH}(10 \%, 23 \mathrm{~mL})$ was added to the 2 H chromenecarbonitrile above obtained ( $1.0 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv.). The reaction mixture was heated to $100^{\circ} \mathrm{C}$ for 3 h . The course of the reaction was followed by TLC on silica (hex: $\mathrm{CH}_{2} \mathrm{Cl}_{2} 1: 1$ ) and after completion, the reaction mixture was cooled to room temperature and an aqueous solution of $\mathrm{HCl}(3 \mathrm{~N})$ was carefully added dropwise until pH 3 was reached. The product precipitated as a pale yellow solid, which was filtered,

[^109]recrystallized from MeOH and dried over night over $\mathrm{CaCl}_{2}$ in a dessicator. Yield: $77 \%$ ( $1.4 \mathrm{~g}, 7.7 \mathrm{mmol}$ ).
$\mathbf{3}^{\text {rd }}$ step: The 2 H -chromenecarboxylic acid obtained in the previous step ( $5 \mathrm{mmol}, 1$ equiv.) was suspended in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(11.5 \mathrm{~mL})$. After addition of $\mathrm{Et}_{3} \mathrm{~N}(0.9 \mathrm{~mL}, 6.5 \mathrm{mmol}$, 1.3 equiv.), a homogeneous solution was obtained. Then, a solution of $(\mathrm{PhO}){ }_{2} \mathrm{P}(\mathrm{O}) \mathrm{N}_{3}$ ( $1.19 \mathrm{~mL}, 5.5 \mathrm{mmol}, 1.1$ equiv.) in toluene ( 5 mL ) was added dropwise to the reaction mixture over a period of 15 minutes. Afterwards, the solution was heated to $50{ }^{\circ} \mathrm{C}$ for 1.5 h . Another aliquot of toluene ( 11.5 mL ) was added and the solution was heated subsequently to $85{ }^{\circ} \mathrm{C}$ for 2.5 h . The quantitative formation of the isocyanate intermediate was followed by TLC on silica (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ 20:80). Finally, the reaction mixture was cooled down and an aqueous solution of $\mathrm{HCl}(6 \mathrm{~N}, 50 \mathrm{~mL})$ was added. The biphasic system was heated under reflux for 16 h . The course of the reaction was controlled by TLC on silica gel (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2} 20: 80$ ). Then, the layers were separated; the organic phase was washed with a saturated solution of $\mathrm{NaHCO}_{3}$ and brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The product was purified by column purification on silica gel (hexane/EtOAc 90:10). Pale yellow solid. m. p. $=81-82^{\circ} \mathrm{C}$. Yield: $48 \%(430 \mathrm{mg}, 2.4 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.02$ $-6.91(\mathrm{~m}, 1 \mathrm{H}), 6.81(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.68(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.41(\mathrm{~s}, 2 \mathrm{H}), 3.86(\mathrm{~s}$, $3 \mathrm{H}), 3.56(\mathrm{~s}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 207.1,149.1,143.4,123.2,122.5$, 120.3, 110.7, 72.9, 55.8, 40.5. MS: calculated for $\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{O}_{3}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 179.0708; found, 179.0708.

## 4-(2-Methylprop-1-en-1-yl)chroman-3-one (65)

The same procedure employed for the synthesis of rac 1 -substituted $\beta$-tetralones (Section 5.4.12) was used starting from the commercially available 5,7,8,9-tetrahydro6 H -benzo[7]annulen-6-one ( $740 \mathrm{mg}, 5 \mathrm{mmol}$ ), obtaining compound $\mathbf{6 5}$ as a yellow oil. Yield: $30 \%$ ( $360 \mathrm{mg}, 1.5 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.30-7.17(\mathrm{~m}, 4 \mathrm{H}$ ), $7.07-6.87(\mathrm{~m}, 4 \mathrm{H}), 6.77(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.51(\mathrm{~d}, J=17.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.35(\mathrm{~d}, J=$ $17.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.80-3.69(\mathrm{~m}, 1 \mathrm{H}), 3.25(\mathrm{dd}, J=13.5,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.09(\mathrm{dd}, J=13.5$, $8.7 \mathrm{~Hz}, 1 \mathrm{H}){ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 209.1,154.4,137.4,129.2,129.1,128.6$, 128.3, 126.6, 123.0, 117.6, 72.7, 52.6, 38.0.

### 5.4.14. Preparation of seven-membered cycloalkanones 55 and 66

## 5,7,8,9-tetrahydro-6H-benzo[7]annulen-6-one (55)

Known cycloalkanone $\mathbf{5 5}^{276}$ was prepared according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: ${ }^{277}$ Under argon atmosphere, potassium tert-butoxide ( $1.35 \mathrm{~g}, 12 \mathrm{mmol}, 1.2$ equiv.) was added to a mixture of methyltripheylphosphonium bromide ( $4.29 \mathrm{~g}, 12$ mmol, 1.2 equiv.) in anhydrous $\mathrm{Et}_{2} \mathrm{O}$. The resulting mixture was stirred at rt for 1 h and a solution of $\alpha$-tetralone ( $1.3 \mathrm{~mL}, 10 \mathrm{mmol}, 1$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{~mL})$ was slowly added. The resulting mixture was allowed to stir overnight, passed through a pad of celite and washed with $\mathrm{Et}_{2} \mathrm{O}$. The solvent was eliminated under reduced pressure and the crude was diluted with hexane before passing it again trough a pad of celite. The alkene was purified by flash column chromatography (hexane/EtOAc 99:1). The spectroscopic data were identical to those reported in the literature. Yield: Cuantitative. ${ }^{\mathbf{1}} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.72-7.60(\mathrm{~m}, 1 \mathrm{H}), 7.18-7.13(\mathrm{~m}, 2 \mathrm{H}), 7.13-7.06(\mathrm{~m}, 1 \mathrm{H}), 5.62-$ $5.27(\mathrm{~m}, 1 \mathrm{H}), 4.95(\mathrm{~d}, J=1.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{t}, J=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.61-2.46(\mathrm{~m}, 2 \mathrm{H})$, $1.89(\mathrm{p}, J=6.3 \mathrm{~Hz}, 2 \mathrm{H})$.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{276}$ Iodobenzene ( $1.3 \mathrm{~mL}, 11.5 \mathrm{mmol}, 1.15$ equiv.), meta-chloroperbenzoic acid ( $70 \%$ ) ( $2.6 \mathrm{~g}, 11.5 \mathrm{mmol}, 1.15$ equiv.) and para-toluenesulfonic acid monohydrate ( 2.2 $\mathrm{g}, \quad 11.5 \mathrm{mmol}, 1.15$ equiv.) were stirred together in hexafluoroisopropanol (HFIP)/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:6) $(50 \mathrm{~mL})$ for 30 min before the previously obtained alkene was added at $0^{\circ} \mathrm{C}$. The reaction mixture was allowed to warm to rt and stirred for 1 h . The reaction was quenched with $\mathrm{NaHCO}_{3}$, the phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$. The combined organic layers were washed with brine ( 50 mL ), dried over $\mathrm{MgSO}_{4}$ and the solvent was eliminated under reduced pressure. The desired ketone $\mathbf{5 5}$ was purified by flash column chromatography (hexane/EtOAc 92:8). Yellow oil. Yield: $90 \%$ ( $1.44 \mathrm{~g}, 9.0 \mathrm{mmol}$ ). The spectroscopic data were identical to those reported in the literature. ${ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $7.24-7.12(\mathrm{~m}, 4 \mathrm{H}), 3.73(\mathrm{~s}, 2 \mathrm{H}), 3.10-2.80(\mathrm{~m}, 2 \mathrm{H}), 2.57(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.00(\mathrm{dt}, J$ $=13.2,6.6 \mathrm{~Hz}, 2 \mathrm{H})$.

[^110]
## 5-benzyl-5,7,8,9-tetrahydro-6 H -benzo[7]annulen-6-one (66)

The same procedure employed for the synthesis of rac 1 -substituted $\beta$-tetralones (Section 5.4.12) was used starting compound 55 ( $801 \mathrm{mg}, 5 \mathrm{mmol}$ ), affording new product 66 as a yellow oil. Yield: $64 \%(803 \mathrm{mg}, 3.2 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.31-7.06(\mathrm{~m}, 8 \mathrm{H}), 7.02(\mathrm{~d}, J=6.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.15(\mathrm{dd}, J=7.9,6.1 \mathrm{~Hz}, 1 \mathrm{H})$, 3.65 (dd, $J=13.4,7.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), $3.08-2.93$ (m, 2H), 2.79 (ddd, $J=14.1,9.3,4.0 \mathrm{~Hz}$, $1 \mathrm{H}), 2.67-2.53(\mathrm{~m}, 1 \mathrm{H}), 2.53-2.43(\mathrm{~m}, 1 \mathrm{H}), 2.15-2.00(\mathrm{~m}, 1 \mathrm{H}), 1.98-1.80(\mathrm{~m}$, 1H). ${ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 209.88,140.08,139.71,136.56,129.35,129.21$, $128.15,127.85,127.27,126.88,126.05,58.67,43.70,35.02,32.72,27.88$. MS: calculated for $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{O}_{5}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 251.1436; found, 251.1436.

### 5.4.15. $\alpha$-Alkylation of $\boldsymbol{\beta}$-tetralones and related ketones with nitroalkenes

### 5.4.15.1.General procedure

The selected catalyst ( $2 \mathrm{~mol} \%$ for $\mathrm{R}^{2}=\mathrm{H} ; 10 \mathrm{~mol} \%$ for $\mathrm{R}^{2} \neq \mathrm{H}$ ) was added to a solution of the corresponding cycloalkanone $\mathbf{4 9}, 53$ or 55 ( $0.3 \mathrm{mmol}, 1$ equiv.) and nitroalkene 32 ( $0.36 \mathrm{mmol}, 1,2$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at the specified temperature. The resulting solution was stirred at the specified temperature until the reaction was completed (monitored by TLC hexane/EtOAc 80:20) and the mixture was directly submitted to a flash column chromatography (hexane/EtOAc 90:10), affording the corresponding $\alpha$-alkylation adducts as essentially pure compound.

The racemic version of the reaction was performed following the asymmetric reaction procedure except the reaction was conducted at room temperature and TEA (20 $\mathrm{mol} \%$ ) was used as the catalyst.

### 5.4.15.2.Characterization data for compounds 51, $\mathbf{5 4}$ and 56

## (S)-1-((S)-2-Nitro-1-phenylethyl)-3,4-dihydronaphthalen-2(1H)-one (51Aa)

The adduct was obtained as a $4: 1$ mixture of diastereomers by using $\beta$-tetralone 49A ( $40 \mu \mathrm{~L}, 0.3 \mathrm{mmol}, 1$ equiv.), nitrostyrene 32a (54 $\mathrm{mg}, 0.36 \mathrm{mmol}, 1.2$ equiv.) and catalyst $\mathbf{C} 7$, and carrying out the reaction at $-20^{\circ} \mathrm{C}$. Foam. Yield: $83 \%(75 \mathrm{mg}, 0.251 \mathrm{mmol})$. Major diastereomer $(S, S):{ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.17(\mathrm{dq}, J=22.2,7.5 \mathrm{~Hz}, 6 \mathrm{H}), 6.84$ (d, $J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.71(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.94(\mathrm{dd}, J=13.4,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.72(\mathrm{dd}$, $J=13.4,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.27(\mathrm{q}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.65(\mathrm{~d}, J=6.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.68-2.45(\mathrm{~m}$, 2H), 2.45-2.27 (m, 1H), 2.14-1.99 (m, 1H). ${ }^{13}$ C NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 211.4$, 138.1, 135.8, 132.9, 129.6, 128.6, 128.2, 128.1, 127.6, 126.6, 77.2, 56.6, 46.3, 38.5, 26.3. ## (S)-5-((S)-1-(2-Chlorophenyl)-2-nitroethyl)-5,7,8,9-tetrahydro-6H-

 benzo[7]annulen-6-one (56e)

The general procedure was applied starting from $55(48 \mathrm{mg}, 0.3$ mmol, 1 equiv.), o-chloronitrostyrene (32e) ( $66 \mathrm{mg}, 0.36 \mathrm{mmol}, 1.2$ equiv.) and $10 \mathrm{~mol} \%$ catalyst $\mathbf{C}$, and carrying out the reaction at room temperature for 32 h . Foam. Single diastereomer.Yield: $75 \%$ $(77 \mathrm{mg}, 0.23 \mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-23.1^{\circ}(c=2.00,99 \% e e, d r=>20: 1$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.18-7.11(\mathrm{~m}, 1 \mathrm{H})$, $7.11-6.94(\mathrm{~m}, 5 \mathrm{H}), 6.81(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.00-4.76(\mathrm{~m}, 4 \mathrm{H}), 3.25(\mathrm{ddd}, J=13.7$, $10.4,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.06-2.87(\mathrm{~m}, 2 \mathrm{H}), 2.68(\mathrm{ddd}, J=12.3,5.2,3.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.33-2.18$ (m, 1H), 1.95-1.77 (m, 1H). ${ }^{13}$ C NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 208.1,141.5,134.3,134.1$, $132.8,130.2,129.5,128.9,128.6,127.6,127.3,127.2,77.5,54.7,45.4,38.7,33.4,28.7$. MS: calculated for $\mathrm{C}_{19} \mathrm{H}_{18} \mathrm{ClNO}_{3} \mathrm{Na}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 366.0873; found, 366.0869. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IA,
hexane/isopropanol, 90:10; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 7.2 min (major), 8.4 min (minor)).

### 5.4.16. Base-promoted epimerization of $\boldsymbol{\beta}$-tetralone 51Aa

Triethylamine ( $2.5 \mu \mathrm{~L}, 0.02 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) was added over a solution of the 51Aa/51Aa' mixture previously obtained ( $d r=3: 1,99 \% e e ; 30 \mathrm{mg}, 0.1 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.3 \mathrm{~mL})$ and the mixture was stirred at room temperature for 2 h . The resulting product was purified by flash column chromatography (hexane/EtOAc 90:10). Yield: $95 \%$ ( $29 \mathrm{mg}, 0.95 \mathrm{mmol}$ ). The enantiomeric and diastereomeric purity were determined by chiral HPLC analysis.

Chromatograms before and after epimerization:

| Retention Time | \% Area |
| :--- | :--- |
| 10,360 | 0,09 |
| 12,557 | 77,43 |
| 13,777 | 0,07 |
| 23,292 | 22,41 |

| Retention Time | \% Area |
| :--- | :--- |
| 10,635 | 0,08 |
| 13,174 | 49,36 |
| 14,200 | 0,30 |
| 23,162 | 50,26 |

### 5.4.17. Elaboration of adducts 51

5.4.17.1.Synthesis of tricyclic compounds 57/57' and 58/58'

Nitrostyrene ( $60 \mathrm{mg}, 0.4 \mathrm{mmol}, 2$ equiv.) was added to a solution of adduct 51Aa ( $59 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) and catalyst $\mathbf{C} 7(12.6 \mathrm{mg}, 0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) in dichloromethane $(0.6 \mathrm{~mL})$ and the resulting mixture was stirred for 48 h at room temperature. Then the mixture was directly submitted to a flash column chromatography (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2} 75: 25$ ) from which essentially pure compounds 57 and 57' were obtained separately as white solids.

## (4bS,5S,6R,7R, $8 S, 8 \mathrm{BR}$ )-6,8-Dinitro-5,7-diphenyl-5,6,7,8,9,10-

hexahydrophenanthren-8a(4bH)-ol (57)

The product was obtained following the general procedure from adduct 51Aa and nitrostyrene (32a). Major isomer. Diastereomeric ratio $3: 1$. Yield: $45 \% ~(~ 40 \mathrm{mg}, 0.09 \mathrm{mmol}$ ). Structure confirmed by xray analysis. $[\alpha]_{\mathrm{D}}{ }^{23}=-38.3^{\circ}(c=0.30,99 \% e e$, acetone $) .{ }^{1} \mathbf{H}$ NMR ( 300 MHz , acetone- $d_{6}$ ) $\delta 7.75$ (d, $J=7.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.46-7.28 (m, $6 \mathrm{H}), 7.25-7.16(\mathrm{~m}, 2 \mathrm{H}), 7.15-7.04(\mathrm{~m}, 2 \mathrm{H}), 6.98(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.86(\mathrm{t}, J=7.6$ $\mathrm{Hz}, 1 \mathrm{H}), 6.75(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.19(\mathrm{~d}, J=12.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.56(\mathrm{t}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H})$, 4.73 (dd, $J=12.5,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.44(\mathrm{dd}, J=12.3,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.14(\mathrm{~d}, J=12.3 \mathrm{~Hz}$, $1 \mathrm{H}), 4.06(\mathrm{~s}, 1 \mathrm{H}), 3.25-3.10(\mathrm{~m}, 1 \mathrm{H}), 3.10-2.99(\mathrm{~m}, 1 \mathrm{H}), 2.99-2.87(\mathrm{~m}, 1 \mathrm{H}), 1.80$ (ddd,

### 5.4.17.2.Synthesis of spirocyclic compound $\mathbf{6 0}$

(4S,5S)-5-(2-chlorophenyl)-4-nitro-5-((S)-2-oxo-1,2,3,4-tetrahydronaphthalen-1yl)pentanal (59)

Catalyst C7 ( $13 \mathrm{mg}, 0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) was added to a solution of acrolein ( $27 \mu \mathrm{~L}, 0.4 \mathrm{mmol}$, 2 equiv.) and the previously obtained nitroketone 51Ae ( $67 \mathrm{mg}, 0.2$ mmol, 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ and the resulting solution was stirred at room temperature for 8 h . The product was purified by flash column chromatography (hexane/EtOAc 90:10) obtaining the addition compound as a sole diastereomer. Foam. Yield: $80 \%$ ( $62 \mathrm{mg}, 0.16 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.64$ (s, 1H), 7.18 (ddd, $J=40.5,22.9,9.2 \mathrm{~Hz}, 6 \mathrm{H}), 6.87(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.12$ (dt, $J=13.3,6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.85(\mathrm{dd}, J=11.0,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.54(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.69-$ $2.56(\mathrm{~m}, 2 \mathrm{H}), 2.52-2.42(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.23(\mathrm{~m}, 2 \mathrm{H}), 1.85(\mathrm{q}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H})$.

## (1R,2S,3R,6R)-2-(2-Chlorophenyl)-6-hydroxy-3-nitro-3',4'-dihydro-2'H-

 spiro[cyclohexane-1,1'-naphthalen]-2'-one (60)METHOD A:

Pyrrolidine ( $1.1 \mathrm{mg}, 0.015 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) was added to a solution of adduct 59 ( $48 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.) in dichloromethane ( 0.3 mL ) and the resulting solution was stirred at room temperature for 3 h . Then the mixture was directly submitted to a flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOAc} 95: 5\right)$ from which the spirocyclic compound 60 was obtained essentially pure. White solid. Yield: $78 \%$ ( $68 \mathrm{mg}, 0.117$ mmol ).

## METHOD B:

Pyrrolidine ( $1.4 \mathrm{mg}, 0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) was added to a solution of acrolein ( $27 \mu \mathrm{~L}, 0.4 \mathrm{mmol}, 2$ equiv.) and adduct 51Ae ( $67 \mathrm{mg}, 0.2 \mathrm{mmol}, 1$ equiv.) in dichloromethane $(0.4 \mathrm{~mL})$ and the resulting solution was stirred at room temperature for 3 h . Then the mixture was directly submitted to a flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOAc} 95: 5\right)$ from which the spirocyclic compound $\mathbf{6 0}$ was obtained essentially pure as a white solid. Yield: $83 \%$ ( $64 \mathrm{mg}, 0.166 \mathrm{mmol}$ ). Structure confirmed by X-ray analysis. $[\boldsymbol{\alpha}]_{\mathbf{D}}{ }^{23}=+184.0^{\circ}\left(c=2.00,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{\mathbf{1}} \mathbf{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 7.84(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.38-7.30(\mathrm{~m}, 2 \mathrm{H}), 7.19(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.13-$ $7.05(\mathrm{~m}, 1 \mathrm{H}), 7.05-6.95(\mathrm{~m}, 2 \mathrm{H}), 6.92(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.02(\mathrm{td}, J=11.4,4.4 \mathrm{~Hz}$, $1 \mathrm{H}), 4.70-4.58(\mathrm{~m}, 1 \mathrm{H}), 4.26(\mathrm{~d}, J=11.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.66-2.46(\mathrm{~m}, 4 \mathrm{H}), 2.40-2.21(\mathrm{~m}$, $1 \mathrm{H}), 2.15-2.06(\mathrm{~m}, 1 \mathrm{H}), 1.96-1.82(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 214.6$, $139.9,136.9,136.5,134.1,130.7,130.2,129.8,128.7,128.5,128.0,127.5,87.5,77.0$, 61.7, 50.7, 44.3, 30.5, 28.0, 27.8. MS: calculated for $\mathrm{C}_{21} \mathrm{H}_{20} \mathrm{NO}_{4} \mathrm{ClNa}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 408.0977; found, 408.0979 .

### 5.4.17.3.Synthesis of tricyclic compounds 61-64

(1S,3aR,9bS)-1-(2-Chlorophenyl)-2,3,3a,4,5,9b-hexahydro-1H-benzo[e]indole (61) ${ }^{278}$

Nitroalkane 51Aa ( $132 \mathrm{mg}, 0.40 \mathrm{mmol}, 1$ equiv.) was suspended on MeOH ( 4 mL ) and Pd ( $10 \% \mathrm{wt}$. on charcoal) ( $26 \mathrm{mg}, 20 \%$ weight) was added. The reaction mixture was stirred under hydrogen atmosphere ( 45 atm ) at $80^{\circ} \mathrm{C}$ for 24 h . The resulting mixture was filtered over a 2 cm path of celite and the solvent was eliminated under reduced pressure. The product was purified by flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 90: 10\right)$ to afford the amine as a colourless oil. Diastereomeric ratio 10:1. Yield: $80 \%$ ( $90 \mathrm{mg}, 0.32 \mathrm{mmol}$ ). $[\alpha]_{\mathrm{D}}{ }^{23}=+6.6^{\circ}(c=2.00,99 \% e e, d r=10: 1$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.60(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.37-7.30(\mathrm{~m}, 2 \mathrm{H})$, $7.25-7.17(\mathrm{~m}, 1 \mathrm{H}), 7.13-7.05(\mathrm{~m}, 2 \mathrm{H}), 6.99-6.91(\mathrm{~m}, 1 \mathrm{H}), 6.63(\mathrm{~s}, 1 \mathrm{H}), 6.58(\mathrm{~d}, J=7.7$ $\mathrm{Hz}, 1 \mathrm{H}), 4.08(\mathrm{q}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.83(\mathrm{q}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.70-3.59(\mathrm{~m}, 2 \mathrm{H}), 3.31-$ $3.19(\mathrm{~m}, 1 \mathrm{H}), 3.04-2.91(\mathrm{~m}, 1 \mathrm{H}), 2.82-2.70(\mathrm{~m}, 1 \mathrm{H}), 2.15-1.99(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 138.2,135.9,134.6,129.8,128.7,128.4,128.2,128.0,127.4,126.3$, 126.1, 57.7, 51.4, 49.4, 48.5, 26.8, 26.7. ### 5.4.18. $\alpha$-Amination of $\boldsymbol{\beta}$-tetralones and related ketones

### 5.4.18.1.General procedure

Catalyst C27 ( $4.4 \mathrm{mg}, 5 \mathrm{~mol} \%$ ) was added to a solution of the corresponding nucleophile 49, $\mathbf{6 5}$ or $\mathbf{6 6}$ ( $0.15 \mathrm{mmol}, 1$ equiv.) and di-tert-butyl azodicarboxylate (50) ( 0.30 mmol , 2 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$. The resulting solution was stirred at the same temperature until the reaction was completed (monitored by TLC hexane/EtOAc 80:20) and the mixture was directly submitted to a flash column chromatography (hexane/EtOAc 90:10), affording the corresponding $\alpha$-amination adducts as essentially pure compound.

The racemic version of the reaction was performed following the asymmetric reaction procedure except the reaction was conducted at room temperature and TEA (20 $\mathrm{mol} \%$ ) was used as the catalyst.

### 5.4.18.2.Characterization data for compounds $\mathbf{5 2}$ and $\mathbf{6 7}$

## di-tert-Butyl (S)-1-(1-benzyl-2-oxo-1,2,3,4-tetrahydronaphthalen-1-yl)hydrazine-

 1,2-dicarboxylate (52B)NHBoc The adduct was obtained by using 1-benzyl- $\beta$-tetralone (49B) ( 35 mg ,

52B $0.15 \mathrm{mmol}, 1$ equiv.), di-tert-butyl azodicarboxylate ( $69 \mathrm{mg}, 0.30$ mmol, 2 equiv.) and catalyst $\mathbf{C} 27(4.4 \mathrm{mg}, 5 \mathrm{~mol} \%)$ and carrying out the reaction at $0{ }^{\circ} \mathrm{C}$. Yellow oil. Yield: $86 \%$ ( $60 \mathrm{mg}, 0.129 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{22}=-296.6^{\circ}\left(c=3.00,98 \% \mathrm{ee}, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.35(\mathrm{~d}, J=$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.36(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.10(\mathrm{~m}, 2 \mathrm{H}), 7.01(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 6.86$ $(\mathrm{d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.78(\mathrm{~s}, 1 \mathrm{H}), 6.50(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.60(\mathrm{~d}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H})$, $2.97(\mathrm{~d}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.65-2.38(\mathrm{~m}, 2 \mathrm{H}), 2.31-2.09(\mathrm{~m}, 1 \mathrm{H}), 1.54(\mathrm{~s}, 9 \mathrm{H}), 1.30-$
$1.21(\mathrm{~m}, 1 \mathrm{H}), 1.18(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 214.6,156.3,154.5,139.3$, 135.2, 133.8, 130.9, 127.8, 127.2, 127.0, 1269, 82.3, 81.0, 71.1, 46.6, 37.4, 28.3, 27.9, 25.8. MS: calculated for $\mathrm{C}_{27} \mathrm{H}_{34} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{Na}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 489.2365; found, 489.2374. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IC, hexane/isopropanol, $98: 2$; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 8.9 min (minor), 17.3 min (major)).

## di-tert-Butyl (S)-1-(1-(3-methylbut-2-en-1-yl)-2-oxo-1,2,3,4-tetrahydronaphthalen-1-yl)hydrazine-1,2-dicarboxylate (52C)

The adduct was obtained by using 1-(3-methylbut-2-en-1-yl)-tetralone (49C) ( $30 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.), di-tert-butyl azodicarboxylate ( 69 $\mathrm{mg}, 0.30 \mathrm{mmol}, 2$ equiv.) and catalyst $\mathbf{C} 27(4.4 \mathrm{mg}, 5 \mathrm{~mol} \%)$ and carrying out the reaction at $0^{\circ} \mathrm{C}$. Yellow oil. Yield: $84 \%$ ( $56 \mathrm{mg}, 0.126$ $\mathrm{mmol}) .[\alpha]_{\mathrm{D}}{ }^{23}=-32.9^{\circ}\left(c=1.50,90 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.09(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.34-7.25(\mathrm{~m}, 1 \mathrm{H}), 7.21-7.15(\mathrm{~m}, 1 \mathrm{H}), 7.14$ $-7.08(\mathrm{~m}, 1 \mathrm{H}), 6.64(\mathrm{~s}, 1 \mathrm{H}), 4.80(\mathrm{t}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.23-2.96(\mathrm{~m}, 2 \mathrm{H}), 2.77-2.65$ (m, 3H), $2.52-2.40(\mathrm{~m}, 1 \mathrm{H}), 1.59-1.43(\mathrm{~m}, 15 \mathrm{H}), 1.30-1.18(\mathrm{~m}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 212.8,156.0,154.8,135.7,127.4,127.2,127.0,126.6,117.2,82.0,808$, 37.0, 36.9, 28.3, 28.1, 27.9, 27.6, 25.8, 17.5. MS: calculated for $\mathrm{C}_{25} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{Na}(\mathrm{M}+$ $\mathrm{Na}^{+}$), 467.2522; found, 467.2529. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak ADH, hexane/isopropanol, 90:10; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 4.9 min (minor), 11.3 min (major)).
di-tert-Butyl
(S)-1-(1-(cyanomethyl)-2-oxo-1,2,3,4-tetrahydronaphthalen-1-yl)hydrazine-1,2-dicarboxylate (52D)
The adduct was obtained by using 2-(2-oxo-1,2,3,4- 2.00, $96 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.21-7.86(\mathrm{~m}, 1 \mathrm{H}), 7.48-7.30$ $(\mathrm{m}, 2 \mathrm{H}), 7.28-7.18(\mathrm{~m}, 1 \mathrm{H}), 6.66(\mathrm{~s}, 1 \mathrm{H}), 3.72-2.57(\mathrm{~m}, 6 \mathrm{H}), 1.50(\mathrm{~d}, J=14.4 \mathrm{~Hz}$, 9H), 1.36 - 1.25 (m, 9H). ${ }^{13} \mathbf{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 207.4,155.9,134.6,129.5$, 128.9, 128.4, 127.6, 126.9, 116.0, 83.2, 81.8, 68.8, 36.3, 28.1, 27.9, 27.8, 26.6. MS: calculated for $\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{~N}_{3} \mathrm{O}_{5}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 416.2185; found, 416.2191. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak IA, hexane/isopropanol, 90:10; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 11.4 min (minor), 20.6 $\min ($ major)).

## di-tert-Butyl (S)-1-(2-oxo-1-(prop-2-yn-1-yl)-1,2,3,4-tetrahydronaphthalen-1-yl)hydrazine-1,2-dicarboxylate (52E)

The adduct was obtained by using 1-(Prop-2-yn-1-yl)-tetralone 49E ( $28 \mathrm{mg}, 0.15 \mathrm{mmol}, 1$ equiv.), di-tert-butyl azodicarboxylate ( 69 mg , $0.30 \mathrm{mmol}, 2$ equiv.) and catalyst C27 ( $4.4 \mathrm{mg}, 5 \mathrm{~mol} \%$ ) and carrying out the reaction at $0^{\circ} \mathrm{C}$. Yellow oil. Yield: $83 \%$ ( $52 \mathrm{mg}, 0.125 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=-48.8^{\circ}\left(c=2.00,99 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.08(\mathrm{~d}, J=$ $7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.37-7.23(\mathrm{~m}, 1 \mathrm{H}), 7.26-7.10(\mathrm{~m}, 2 \mathrm{H}), 6.64(\mathrm{~s}, 1 \mathrm{H}), 3.29-3.16(\mathrm{~m}$, $2 \mathrm{H}), 3.02-2.73(\mathrm{~m}, 3 \mathrm{H}), 1.97(\mathrm{~s}, 1 \mathrm{H}), 1.52-1.46(\mathrm{~m}, 9 \mathrm{H}), 1.28-1.19(\mathrm{~m}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 209.0,155.8,154.4,134.3,127.5,127.3,127.1,82.3,80.9$, 78.7, 72.3, 36.9, 28.8, 28.2, 27.8. MS: calculated for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{Na}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 437.0252; found, 437.0251. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak ADH, hexane/isopropanol, 90:10; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 7.0 min (minor), 14.7 min (major)).
di-tert-Butyl ( $\boldsymbol{S}$ )-1-(4-benzyl-3-oxochroman-4-yl)hydrazine-1,2-dicarboxylate (67)

The adduct was obtained by using 4-benzylchroman-3-one $\mathbf{6 5}$ ( 28 mg , $0.15 \mathrm{mmol}, 1$ equiv.), di-tert-butyl azodicarboxylate ( $69 \mathrm{mg}, 0.30$ mmol, 2 equiv.) and catalyst $\mathbf{C} 27$ ( $4.4 \mathrm{mg}, 5 \mathrm{~mol} \%$ ) and carrying out the reaction at $-60^{\circ} \mathrm{C}$. Yellow oil. Yield: $89 \%$ ( $63 \mathrm{mg}, 0.134 \mathrm{mmol}$ ). $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=-98.7^{\circ}\left(c=1.50,94 \% e e, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26(\mathrm{~d}, J=$ $8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-6.90(\mathrm{~m}, 6 \mathrm{H}), 6.77-6.47$ (m, 3H), $4.34(\mathrm{~d}, J=17.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.97$ (d, $J=17.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.50(\mathrm{~d}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{~d}, J=12.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.56(\mathrm{~s}, 9 \mathrm{H})$, 1.33 - 1.19 (m, 9H). ${ }^{13}{ }^{\mathbf{C}}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 210.6,156.2,152.8,132.9,130.4$, 128.6, 127.9, 127.4, 127.2, 122.8, 116.6, 82.8, 81.3, 71.6, 45.5, 28.2, 27.9. MS: calculated for $\mathrm{C}_{26} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{Na}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 491.218; found, 491.2154. The enantiomeric purity was determined by chiral HPLC analysis (Daicel Chiralpak ADH, hexane/isopropanol, 90:10; flux $=1 \mathrm{~mL} / \mathrm{min}$; retention times: 5.9 min (minor), 10.8 min (major)).

### 5.5. Experimental section of chapter 4

### 5.5.1. Oxazolidinone route

5.5.1.1. Preparation of imine $\mathbf{7 6}^{280}$

L-Tyrosine ( $1.0 \mathrm{~g}, 5.5 \mathrm{mmol}, 1$ equiv.) and $\mathrm{NaOH}(220 \mathrm{mg}, 5.5 \mathrm{mmol}, 1$ equiv.) were dissolved in dry methanol ( 20 mL ) in a flame-dried round bottom flask gently warming the mixture and benzaldehyde ( $0.56 \mathrm{~mL}, 5.5 \mathrm{mmol}, 1$ equiv.) was added. The resulting solution was refluxed for 1 h , cooled to room temperature and isopropanol (20 mL was added so the product would precipitate. The resulting solid was filtrated, collected and stored in a vacuum oven at $50^{\circ} \mathrm{C}$ overnight affording compound 76 as a white solid. Yield: $96 \%(1.5 \mathrm{~g}, 5.3 \mathrm{mmol}) .{ }^{\mathbf{1}} \mathbf{H}$ NMR ( 300 MHz , Methanol- $d_{4}$ ) $\delta 7.79$ (s, $1 \mathrm{H}), 7.65$ (dd, $J=7.3,2.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.41-7.30(\mathrm{~m}, 3 \mathrm{H}), 6.95(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 6.58$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}$ ), 3.90 (dd, $J=9.5,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.26-3.20(\mathrm{~m}, 1 \mathrm{H}), 2.94$ (dd, $J=$ $13.6,9.7 \mathrm{~Hz}, 1 \mathrm{H})$.

### 5.5.1.2. Preparation of imine $\mathbf{7 7}$ and transformation into compounds $\mathbf{7 8 - 8 0}$

## Sodium ( $\boldsymbol{S}, \boldsymbol{E}$ )-2-(benzylideneamino)-3-(4-methoxyphenyl)propanoate (77) ${ }^{281}$

$o$-Methyl-L-tyrosine ( $1.0 \mathrm{~g}, 5.1 \mathrm{mmol}$, 1 equiv.) was dissolved in a 1 M NaOH aqueous solution ( $5.1 \mathrm{~mL}, 5.1 \mathrm{mmol}, 1$ equiv.) stirring and gently heating. The water was then evaporated under reduced pressure and the residue was stored in a vacuum oven at $50^{\circ} \mathrm{C}$ overnight before being suspended in dry $\mathrm{EtOH}(10 \mathrm{~mL})$ in a flame-dried

[^113]round bottom flask and adding benzaldehyde ( $0.55 \mathrm{~mL}, 5.4 \mathrm{mmol}, 1.05$ equiv.). The reaction mixture was stirred overnight, concentrated under reduced pressure, suspended in pentane and filtrated to obtain the desired imine as a white solid. Yield: $82 \%(1.3 \mathrm{~g}$, $4.2 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( 400 MHz , Methanol- $d_{4}$ ) $\delta 7.83(\mathrm{~s}, 1 \mathrm{H}), 7.67(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H})$, $7.38(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.73(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.94(\mathrm{dd}, J=$ $9.7,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.28(\mathrm{dd}, J=4.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.01(\mathrm{dd}, J=13.5,9.8 \mathrm{~Hz}, 1 \mathrm{H})$.

## (S)-4-(4-Methoxybenzyl)oxazolidine-2,5-dione (78)

The previously obtained imine 76 ( $200 \mathrm{mg}, 0.66 \mathrm{mmol}, 1$ equiv.) was suspended in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ in a flame-dried round bottom flask and cooled to $-78^{\circ} \mathrm{C}$. Then phosgene ( $15 \% \mathrm{wt}$. in toluene) ( $2.4 \mathrm{~mL}, 3.3 \mathrm{mmol}, 5$ equiv.) was slowly added and the resulting mixture was allowed to slowly warm to room temperature and stirred overnight. The crude of the reaction was concentrated under reduced pressure and was subjected to flash column chromatography (petrol ether/EtOAc 60:40) obtaining N carboxyanhydride 78 as the major product. White solid. Yield: $31 \%$ ( $45 \mathrm{mg}, 0.20$ mmol). ${ }^{1} \mathbf{H}$ NMR ( 500 MHz , Acetone- $d_{6}$ ) $\delta 8.00(\mathrm{~s}, 1 \mathrm{H}), 7.17(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.87$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 4.79(\mathrm{t}, J=5.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 3.14(\mathrm{dd}, J=14.3,4.7 \mathrm{~Hz}$, $1 \mathrm{H}), 3.08(\mathrm{dd}, J=14.3,5.8 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( 126 MHz , Acetone- $d_{6}$ ) $\delta 171.2,159.9$, $152.5,131.7,127.5,114.7,59.6,55.4,36.8$. MS: calculated for $\mathrm{C}_{11} \mathrm{H}_{11} \mathrm{NO}_{4} \mathrm{Na}(\mathrm{M}+$ $\mathrm{Na}^{+}$), 244.0580; found 244.0580.
(S)-3-Benzoyl-4-(4-methoxybenzyl)-2-phenyloxazolidin-5-one (79)

The previously obtained imine 77 ( $200 \mathrm{mg}, 0.66 \mathrm{mmol}, 1$ equiv.) was suspended in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ in a flame-dried round bottom flask and cooled to $0{ }^{\circ} \mathrm{C}$. Then
benzoyl chloride ( $0.76 \mathrm{~mL}, 6.6 \mathrm{mmol}, 10$ equiv.) was slowly added and the resulting mixture was allowed to slowly warm to room temperature and stirred overnight. The crude of the reaction was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The resulting product was purified by flash column chromatography (petrol ether/EtOAc 80:20) obtaining the desired product 79 as a white solid in a $2: 1 \mathrm{dr}$. Yield: $70 \%(180 \mathrm{mg}, 0.46 \mathrm{mmol})$. Major isomer: ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.61-6.73(\mathrm{~m}, 14 \mathrm{H}), 5.94(\mathrm{~s}, 1 \mathrm{H}), 5.25(\mathrm{~b}, 1 \mathrm{H}), 3.87(\mathrm{~s}, 3 \mathrm{H}), 3.80$ $-3.04(\mathrm{~b}, 2 \mathrm{H})$. Minor isomer: ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.61-6.73(\mathrm{~m}, 15 \mathrm{H}), 5.08$ (b, 1H), $3.82(\mathrm{~s}, 3 \mathrm{H}), 3.80-3.04(\mathrm{~b}, 2 \mathrm{H})$. MS: calculated for $\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{NO}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right)$, 388.1543; found 388.1554.

## 2,5-Dioxopyrrolidin-1-yl <br> (S)-4-(4-methoxybenzyl)-5-oxo-2-phenyloxazolidine-3carboxylate (80)

The previously obtained imine 77 ( $200 \mathrm{mg}, 0.66 \mathrm{mmol}, 1$ equiv.) and $N, N^{\prime}$ disuccinimidyl carbonate (DSC) ( $338 \mathrm{mg}, 1.32 \mathrm{mmol}, 2$ equiv.) were cooled in a flamedried round bottom flask to $-78{ }^{\circ} \mathrm{C}$ and dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was slowly added. The resulting mixture was allowed to slowly warm to room temperature and stirred overnight. The crude of the reaction was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The resulting product was purified by flash column chromatography (petrol ether/EtOAc 80:20) obtaining the desired product as a white solid, which showed low stability. Yield: $35 \%$ ( $98 \mathrm{mg}, 0.23 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.91(\mathrm{~s}, 1 \mathrm{H}), 7.70(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.46-7.34(\mathrm{~m}, 3 \mathrm{H}), 7.11$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.79(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 4.44(\mathrm{dd}, J=9.0,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{~s}$, $3 \mathrm{H}), 3.44(\mathrm{dd}, J=14.0,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.25(\mathrm{dd}, J=13.8,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{~s}, 4 \mathrm{H})$.

### 5.5.2. Imidazolidinone route

### 5.5.2.1. Preparation of spirocyclic compound $\mathbf{7 3}$

Imidazolidinone $\mathbf{7 3}$ was synthesised from intermediate $\mathbf{8 1}$ provided by L. Eagling according to the following synthetic sequence: ${ }^{282}$

$\mathbf{1}^{\text {st }}$ step: Palladium on active carbon ( $10 \% \mathrm{wt}$.) ( $200 \mathrm{mg}, 20 \% \mathrm{wt}$.) was added to a solution of the benzyl ether $\mathbf{8 1}(0.95 \mathrm{~g}, 2.3 \mathrm{mmol})$ in dry THF in a flame-dried round bottom flask and the mixture was stirred at room temperature for 1 h under hydrogen atmosphere. The reaction mixture was filtered over a pad of celite and the solvent was eliminated under reduced pressure obtaining the desired alcohol 71 as a white solid. Yield: $83 \%$ ( $620 \mathrm{mg}, 1.9 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.05$ (d, $J=8.4 \mathrm{~Hz}$, 2H), 6.72 (bs, 2H), 4.86 (d, $J=36.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 4.69 (d, $J=44.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.40$ (d, $J=$ $12.1 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.74 (dd, $J=54.3,17.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.24 (dd, $J=34.7,14.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.82$ (d, $J=49.2 \mathrm{~Hz}, 3 \mathrm{H}), 0.97(\mathrm{~d}, J=28.3 \mathrm{~Hz}, 9 \mathrm{H})$.
$2^{\text {nd }}$ step: Triethylamine ( $0.37 \mathrm{~mL}, 3.6 \mathrm{mmol}, 2$ equiv.) and potassium iodide ( 340 mg , $2.0 \mathrm{mmol}, 1.1$ equiv.) were added to a solution of the previously obtained phenol 71 ( $600 \mathrm{mg}, 1.8 \mathrm{mmol}, 1$ equiv.) in a $4: 1$ mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and toluene ( 3.5 mL ) in a flame-dried round bottom flask and the reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 72 h . The solvent was then eliminated under reduced pressure and the residue was dissolved in dihloromethane ( 5 mL ), washed with water ( 3 x 5 mL ) dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The resulting product was purified by flash

[^114]column chromatography (petrol ether/EtOAc 70:30) obtaining the desired product 72 as a white solid. Yield: $81 \%(420 \mathrm{mg}, 1.5 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.93$ (d, $J$ $=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.72(\mathrm{~d}, J=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.41(\mathrm{~d}, J=10.1 \mathrm{~Hz}$, $1 \mathrm{H}), 4.86(\mathrm{~s}, 1 \mathrm{H}), 4.46(\mathrm{t}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.04(\mathrm{~s}, 3 \mathrm{H}), 2.62(\mathrm{dd}, J=13.5,7.2 \mathrm{~Hz}, 1 \mathrm{H})$, 2.47 (dd, $J=13.2,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.04(\mathrm{~s}, 9 \mathrm{H})$.
$\mathbf{3}^{\text {rd }}$ step: Cerium chloride heptahydrate ( $780 \mathrm{mg}, 2.1 \mathrm{mmol}, 1.5$ equiv.) and sodium borohydride ( $81 \mathrm{mg}, 2.1 \mathrm{mmol}, 1.5$ equiv.) were added to a solution of the previously obtained spirocycle 72 ( $380 \mathrm{mg}, 1.4 \mathrm{mmol}, 1$ equiv.) at $0^{\circ} \mathrm{C}$ in dry methanol in a flamedried round bottom flask and the reaction mixture was stirred at the same temperature for 2 h . The reaction was quenched with water and diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic phase was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The two diastereomers could be separated by flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 95: 5\right)$ obtaining the product as a white solid in a $3: 173 / 73$ ' proportion. Total yield: $67 \%$ ( $270 \mathrm{mg}, 0.94 \mathrm{mmol}$ ). Store under argon, slowly oxidizes back to the ketone with time. Major isomer (74): ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.21$ (ddd, $J=$ $10.0,3.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.12(\mathrm{ddd}, J=9.8,3.8,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.92(\mathrm{~d}, J=9.4 \mathrm{~Hz}, 1 \mathrm{H})$, $5.64(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.79(\mathrm{~s}, 1 \mathrm{H}), 4.47(\mathrm{~s}, 1 \mathrm{H}), 4.36(\mathrm{t}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.99(\mathrm{~s}$, $3 \mathrm{H}), 2.47(\mathrm{dd}, J=13.2,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.15(\mathrm{dd}, J=13.2,8.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.01(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 178.0,172.3,131.6,130.8,129.4,128.1,81.8,61.4,56.8$, $50.5,38.9,38.3,31.4,25.8$. Minor isomer (74'): ${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.16(\mathrm{~d}$, $J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.05(\mathrm{~d}, J=10.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.90(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.61(\mathrm{~d}, J=10.0$ $\mathrm{Hz}, 1 \mathrm{H}), 4.80(\mathrm{~s}, 1 \mathrm{H}), 4.68(\mathrm{~s}, 1 \mathrm{H}), 4.36(\mathrm{t}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.00(\mathrm{~s}, 3 \mathrm{H}), 2.53-2.45$ $(\mathrm{m}, 1 \mathrm{H}), 2.25-2.16(\mathrm{~m}, 1 \mathrm{H}), 1.60(\mathrm{~d}, J=8.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.02(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (126 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 177.5,172.3,131.5,129.8,128.0,126.3,81.6,61.8,56.8,50.2,38.5$, 38.3, 31.3, 25.8.
5.5.2.2. Synthesis of disodium arogenate (70) $)^{283}$

[^115]The major diastereomer of the above obtained alcohol (73) ( $50 \mathrm{mg}, 0.17 \mathrm{mmol}$, 1 equiv.) was dissolved in a mixture of $\mathrm{H}_{2} \mathrm{O}(0.75 \mathrm{~mL})$ and dioxane ( 0.25 mL ), and barium hydroxide ( $87 \mathrm{mg}, 0.51 \mathrm{mmol}, 3$ equiv.) were added. The reaction mixture was stirred at $90^{\circ} \mathrm{C}$ for 4 h , after which the reaction mixture was cooled to room temperature and sodium carbonate anhydrous ( $110 \mathrm{mg}, 1.0 \mathrm{mmol}, 6$ equiv.) and water ( 3 mL ) were added. The resulting barium carbonate salt was separated by filtration and the aqueous layer was washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 4 \mathrm{~mL})$. The aqueous phase was concentrated under reduced pressure and the product was purified by reverse phase chromatography ( 0.1 M TFA/acetonitrile $99: 1$ to $0: 100$ ) being the last thing to exit the column. The spectroscopic data resulted coincidental with the one found in the literature. ${ }^{284}{ }^{1} \mathbf{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) \delta 6.06-5.97(\mathrm{~m}, 3 \mathrm{H}), 5.90(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.63-4.52(\mathrm{~m}, 1 \mathrm{H})$, $3.14-3.08(\mathrm{~m}, 1 \mathrm{H}), 2.23-2.07(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{dd}, J=14.1,7.4 \mathrm{~Hz}, 1 \mathrm{H})$.

### 5.5.3. Acyclic route

### 5.5.3.1. Preparation of ester intermediate $\mathbf{8 2}^{285}$

The commervially available $O$-benzyl methyltyrosinate hydrochloride ( $1.0 \mathrm{~g}, 3.1$ mmol, 1 equiv.) was dissolved in dry $\mathrm{MeOH}(15 \mathrm{~mL})$ and neutralised with sodium hydroxide powder ( $130 \mathrm{mg}, 3.3 \mathrm{mmol}, 1.05$ equiv.). Trimethylacetaldehyde ( 0.47 mL , $4.34 \mathrm{mmol}, 1.4$ equiv.) was added and the solution was stirred at room temperature for 10 min before cooling it to $0^{\circ} \mathrm{C}$ and adding sodium borohydride ( $95 \mathrm{mg}, 2.5 \mathrm{mmol}, 0.8$ equiv.). The resulting mixture was stirred at the same temperature for 1 h and the remaining sodium borohydride was treated adding water ( 5 mL ). The methanol was eliminated under reduced pressure and EtOAc ( 15 mL ) was added. The organic phase was separated, washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The product was purified by flash column chromatography (petrol ether/EtOAc $85: 15$ ) obtaining the desired compound $\mathbf{8 2}$ as a white solid. Yield: $55 \%$ ( $610 \mathrm{mg}, 1.7 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.47-7.27(\mathrm{~m}, 5 \mathrm{H}), 7.11(\mathrm{~d}, J=$

[^116]$8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.89(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 5.04(\mathrm{~s}, 2 \mathrm{H}), 3.63(\mathrm{~s}, 3 \mathrm{H}), 3.39(\mathrm{t}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H})$, 2.88 (dd, $J=6.8,2.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.38(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.11(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 1 \mathrm{H}), 0.85$ ( $\mathrm{s}, 9 \mathrm{H}$ ).

### 5.5.3.2. Preparation of amide intermediate 86

$\mathbf{1}^{\text {st }}$ step: ${ }^{286}$ Dimethylamine ( 2 M in THF) ( $0.55 \mathrm{~mL}, 1.1 \mathrm{mmol}, 1.0$ equiv.) was added to a solution of Boc- $O$-benzyl- $L$-tyrosine hydrosuccinimide ester ( $500 \mathrm{mg}, 1.1 \mathrm{mmol}, 1.0$ equiv.) in dry dichloromethane ( 2 mL ) and the resulting solution was stirred for 2 h . The mixture was concentrated under reduced pressure and product was purified by flash column chromatography (petrol ether/EtOAc 80:20) obtaining compound $\mathbf{8 4}$ as a colourless oil. Yield: Cuantitative. ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.50-7.27(\mathrm{~m}, 5 \mathrm{H})$, $7.09(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.88(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 5.39(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.82-4.69$ $(\mathrm{m}, 1 \mathrm{H}), 2.96-2.85(\mathrm{~m}, 2 \mathrm{H}), 2.84(\mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H})$.
$\mathbf{2}^{\text {nd }}$ step: ${ }^{286}$ The above obtained Boc-protected amine $\mathbf{8 4}$ ( $400 \mathrm{mg}, 1.0 \mathrm{mmol}, 1.0$ equiv.) was dissolved in a $1: 1$ mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and trifluoroacetic acd ( 5 mL ) and was stirred at room temperature for 1 h . The solvent was eliminated under reduced pressure and the residue dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$. The organic phase was washed with an aqueous solution of $\mathrm{NaOH}(1 \mathrm{M})(2 \times 5 \mathrm{~mL})$ and brine ( 5 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure obtaining the desired compound $\mathbf{8 5}$ as a white solid. Yield: Cuantitative. ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.47-7.28$ (m, 5H), 7.10 (d, J $=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.91(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 5.05(\mathrm{~s}, 2 \mathrm{H}), 3.91(\mathrm{t}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.90(\mathrm{~s}$, $3 \mathrm{H}), 2.92-2.84(\mathrm{~m}, 1 \mathrm{H}), 2.73(\mathrm{~s}, 3 \mathrm{H}), 2.76-2.69(\mathrm{~m}, 1 \mathrm{H}), 1.82(\mathrm{~s}, 2 \mathrm{H})$.

[^117]$\mathbf{3}^{\text {rd }}$ step: ${ }^{285}$ The previously obtained amine $\mathbf{8 5}$ ( $300 \mathrm{mg}, 1.0 \mathrm{mmol}, 1$ equiv.) was dissolved in dry $\mathrm{MeOH}(15 \mathrm{~mL})$ trimethylacetaldehyde ( $0.15 \mathrm{~mL}, 1.4 \mathrm{mmol}, 1.4$ equiv.) was added. The solution was stirred at room temperature for 10 min before cooling it to $0{ }^{\circ} \mathrm{C}$ and adding sodium borohydride ( $30 \mathrm{mg}, 0.8 \mathrm{mmol}, 0.8$ equiv.). The resulting mixture was stirred at the same temperature for 1 h and the remaining sodium borohydride was treated adding $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$. The methanol was eliminated under reduced pressure and EtOAc ( 5 mL ) was added. The organic phase was separated, washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The product was purified by flash column chromatography (petrol ether/EtOAc 50:50) obtaining the desired amide $\mathbf{8 6}$ as a white solid. Yield: 62\% (230 $\mathrm{mg}, 0.62 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.46-7.26(\mathrm{~m}, 5 \mathrm{H}), 7.13(\mathrm{~d}, J=8.6$ $\mathrm{Hz}, 2 \mathrm{H}), 6.87(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 5.05(\mathrm{~s}, 2 \mathrm{H}), 3.61(\mathrm{dd}, J=8.5,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.90(\mathrm{dd}$, $J=13.2,6.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{~s}, 3 \mathrm{H}), 2.71(\mathrm{dd}, J=13.2,8.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.56(\mathrm{~s}, 3 \mathrm{H}), 2.31(\mathrm{~d}$, $J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.03(\mathrm{~d}, J=10.9 \mathrm{~Hz}, 1 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H})$.

### 5.5.3.3. Synthesis of NCA 83

Pyridine ( $45 \mu \mathrm{~L}, 0.56 \mathrm{mmol}, 1$ equiv) and phosgene ( $15 \% \mathrm{wt}$. in toluene) ( 1.2 $\mathrm{mL}, 1.7 \mathrm{mmol}, 3$ equiv.) were added in this order to a solution of the previously obtained ester $\mathbf{8 2}$ or amide $\mathbf{8 6}\left(0.56 \mathrm{mmol}\right.$, 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$. The resulting mixture was allowed to warm to room temperature and stirred for 4 h . The solvent and the remaining phosgene were eliminated under reduced pressure and the product was purified by flash column chromatography (petrol ether/EtOAc 90:10) obtaining the pure NCA as a white solid. Yield from ester 82: $65 \%$ ( $134 \mathrm{mg}, 0.36$ mmol). Yield from amide 86: $40 \%$ ( $82 \mathrm{mg}, 0.22 \mathrm{mmol}$ ). ${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.40 (dt, $J=14.8,7.2 \mathrm{~Hz}, 4 \mathrm{H}), 7.33(\mathrm{~s}, 1 \mathrm{H}), 7.03(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.91(\mathrm{~d}, J=8.7$ $\mathrm{Hz}, 2 \mathrm{H}), 5.03(\mathrm{~s}, 2 \mathrm{H}), 4.62(\mathrm{t}, J=4.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.60(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.18(\mathrm{~d}, J=$ $4.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.87(\mathrm{~d}, J=14.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.00(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $168.5,158.6,152.4,136.7,130.4,128.6,128.0,127.5,124.6,115.4,70.0,62.4,52.8$, 34.1, 33.4, 28.0. MS: calculated for $\mathrm{C}_{22} \mathrm{H}_{25} \mathrm{NNaO}_{4}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 390.1676; found 390.1679 .

### 5.5.4. Hydantoin route

### 5.5.4.1. Synthesis of hydantoins 87 and 88

(S)-3-(tert-Butyl)-5-(4-((tert-butyldimethylsilyl)oxy)benzyl)-2,4-dioxoimidazolidine -1-carbonyl chloride (75)

Pyridine ( $64 \mu \mathrm{~L}, 0.80 \mathrm{mmol}, 1.5$ equiv.) was added to a triphosgene ( 80 mg , $0.27 \mathrm{mmol}, 0.5$ equiv.) solution in dry dichloromethane ( 3 mL ) in a flame-dried round bottom flask at $-78^{\circ} \mathrm{C}$ and the resulting solution was stirred at the same temperature for 10 min before adding hydantoin 74 provided by L. Eagling ( $200 \mathrm{mg}, 1.53 \mathrm{mmol}, 1$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$. The resulting mixture was slowly warmed to room temperature and was stirred at that temperature for 5 h . The solvent was partially eliminated under reduced pressure and the product was purified by flash column chromatography (petrol ether/EtOAc 90:10) obtaining the desired product 75 as colourless oil. Yield: $63 \%$ ( $423 \mathrm{mg}, 0.96 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.93$ (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.76(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 4.60(\mathrm{dd}, J=4.7,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.46(\mathrm{dd}, J=$ $14.4,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.21(\mathrm{dd}, J=14.4,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}), 0.96(\mathrm{~s}, 9 \mathrm{H}), 0.15(\mathrm{~s}$, $6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.5,155.5,150.7,143.6,130.9,124.9,120.4$, 61.1, 59.8, 34.2, 28.0, 25.6, 18.2, -4.5 . MS: calculated for $\mathrm{C}_{21} \mathrm{H}_{31} \mathrm{ClN}_{2} \mathrm{NaO}_{4} \mathrm{Si}(\mathrm{M}+$ $\mathrm{Na}^{+}$), 461.1639; found 461.1634.

## (S)-3-(tert-Butyl)-5-(4-hydroxybenzyl)imidazolidine-2,4-dione (87) ${ }^{287}$

[^118]The above obtained compound 75 ( $45 \mathrm{mg}, 0.1 \mathrm{mmol}, 1$ equiv.) was dissolved in dry THF ( 1 mL ) and tetrabutylammonium fluoride ( 1 M in THF) ( $105 \mu \mathrm{~L}, 0.105 \mathrm{mmol}$, 1.05 equiv.) was added at $0{ }^{\circ} \mathrm{C}$. The resulting solution was stirred at the same temperature for 30 min before the reaction was quenched by adding brine and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The product was purified by flash column chromatography (petrol ether/EtOAc 50:50) obtaining compound $\mathbf{8 7}$ as a white solid. Yield: $60 \%(16 \mathrm{mg}, 0.060$ mmol). ${ }^{1} \mathbf{H}$ NMR ( 500 MHz , Methanol- $d_{4}$ ) $\delta 7.00(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.68(\mathrm{~d}, J=8.4$ $\mathrm{Hz}, 2 \mathrm{H}), 4.07(\mathrm{t}, J=4.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.00-2.84(\mathrm{~m}, 2 \mathrm{H}), 1.34(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR (126 MHz , Methanol- $d_{4}$ ) $\delta 176.6,173.0,157.7$, 132.2, 126.5, 116.0, 58.4, 37.4, 28.8, 20.9. MS: calculated for $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NNaO}_{3}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 285.1215; found 185.12.

## Methyl <br> (S)-3-(tert-butyl)-5-(4-hydroxybenzyl)-2,4-dioxoimidazolidine-1carboxylate (88)

The carbonyl chloride above obtained (75) ( $45 \mathrm{mg}, 0.1 \mathrm{mmol}, 1$ equiv.) was dissolved in dry $\mathrm{MeOH}(1 \mathrm{~mL})$ in a flame-dried round bottom flask under nitrogen atmosphere and hydrogen chloride ( 1.25 M in MeOH ) ( $0.2 \mathrm{~mL}, 0.25 \mathrm{mmol}, 2.5$ equiv.) was added. The resulting solution was stirred at room temperature for 16 h and the solvent was eliminated under reduced pressure obtaining the desired product as a white solid. Yield: $60 \%(19 \mathrm{mg}, 0.060 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.90(\mathrm{~d}, J=5.7$ $\mathrm{Hz}, 2 \mathrm{H}), 6.74(\mathrm{~d}, J=5.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.21(\mathrm{~s}, 1 \mathrm{H}), 4.49(\mathrm{~s}, 1 \mathrm{H}), 3.95(\mathrm{~s}, 2 \mathrm{H}), 3.37(\mathrm{~d}, J=$ $13.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.15(\mathrm{~d}, J=13.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.33(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $171.0,155.8,152.5,150.8,130.9,124.4,115.4,59.4,59.1,54.0,34.5,28.1$ MS: calculated for $\mathrm{C}_{16} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{NaO}_{5}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 343.1264; found 343.1265.

### 5.5.4.2. Synthesis of hydantoin 92

Hydantoin 92 was prepared according to the following synthetic sequence:

$\mathbf{1}^{\text {st }}$ step: tert-Butyl isocyanate ( $0.45 \mathrm{~mL}, 3.9 \mathrm{mmol}, 1.1$ equiv.) was added to a stirred solution of $O$-benzyl methyltyrosinate hydrochloride ( $1.1 \mathrm{~g}, 3.5 \mathrm{mmol}, 1$ equiv.) and triethylamine ( $1.4 \mathrm{~mL}, 10.5 \mathrm{mmol}, 3$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ in a flame-dried round bottom flask under nitrogen atmosphere and the reaction mixture was stirred at room temperature overnight. The organic phase was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(3 \times 10 \mathrm{~mL})$, a saturated solution of $\mathrm{NaHCO}_{3}(3 \times 10 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was eliminated under reduced pressure to afford the pure urea 89 as a white solid. Yield: Quantitative. ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.47$ $7.29(\mathrm{~m}, 5 \mathrm{H}), 7.02(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 6.89(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.03(\mathrm{~s}, 2 \mathrm{H}), 4.72-$ $4.63(\mathrm{~m}, 1 \mathrm{H}), 4.50(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.20(\mathrm{~s}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.10-2.94(\mathrm{~m}, 2 \mathrm{H})$, $1.30(\mathrm{~s}, 9 \mathrm{H})$.
$2^{\text {nd }}$ step: Potassium tert-butoxyde ( $390 \mathrm{mg}, 3.9 \mathrm{mmol}, 1.1$ equiv.) was added to a stirred solution of the urea $\mathbf{8 9}$ obtained in the previous step ( $1.3 \mathrm{~g}, 3.5 \mathrm{mmol}, 1$ equiv.) in THF $(12 \mathrm{~mL})$ in a flame-dried round bottom flask under nitrogen atmosphere and the reaction mixture was stirred at room temperature for 2 h . The reaction was then quenched by adding a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$. The organic phase was separated and washed with a saturated solution of $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The product was purified by flash column chromatography (petrol ether/EtOAc 70:30) obtaining the desired compound 90 as a white solid. Yield: $58 \%(512 \mathrm{mg}, 2.0 \mathrm{mmol}) .{ }^{1} \mathbf{H} \mathbf{N M R}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.47-$ $7.28(\mathrm{~m}, 5 \mathrm{H}), 7.10(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 6.91(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.47(\mathrm{~s}, 1 \mathrm{H}), 5.04(\mathrm{~s}$, $2 \mathrm{H}), 4.02(\mathrm{dd}, J=7.4,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.10(\mathrm{dd}, J=14.0,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.81(\mathrm{dd}, J=14.0$, $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.49$ (s, 9H).
$3^{\text {rd }}$ step: Pyridine ( $0.24 \mathrm{~mL}, 3.0 \mathrm{mmol}, 1.5$ equiv.) was added to a triphosgene ( 297 mg , $1.0 \mathrm{mmol}, 0.5$ equiv.) solution in dry dichloromethane ( 15 mL ) in a flame-dried round
bottom flask at $-78^{\circ} \mathrm{C}$ and the resulting solution was stirred at the same temperature for 10 min before adding the hydantoin $\mathbf{9 0}$ obtained in the previous step ( $715 \mathrm{mg}, 2.0$ mmol, 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ). The resulting mixture was slowly warmed to room temperature and was stirred at that temperature for further 4 h . The solvent was partially eliminated under reduced pressure and the product was purified by flash column chromatography (petrol ether/EtOAc 80:20) obtaining the desired compound 91 as colourless oil. Yield: $43 \%$ ( $360 \mathrm{mg}, 0.86 \mathrm{mmol}$ ). ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.45-$ $7.27(\mathrm{~m}, 5 \mathrm{H}), 7.00(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.90(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.11-4.98(\mathrm{~m}, 2 \mathrm{H})$, $4.60(\mathrm{dd}, J=4.6,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.47(\mathrm{dd}, J=14.4,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.24(\mathrm{dd}, J=14.4,2.5$ $\mathrm{Hz}, 1 \mathrm{H}), 1.34(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.5,158.5,150.7,143.6,136.7$, 130.9, 128.6, 128.0, 127.3, 124.5, 115.2, 69.9, 61.1, 59.9, 34.2, 28.0. MS: calculated for $\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{ClN}_{2} \mathrm{NaO}_{4}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$, 437.1239; found 437.1243.
$4^{\text {th }}$ step: Palladium on active carbon ( $10 \% \mathrm{wt}$.) ( $2 \mathrm{mg}, 20 \% \mathrm{wt}$.) was added to a solution of compound 91 above obtained ( $20 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) in dry THF in a flame-dried round bottom flask and the mixture was stirred at room temperature for 1 h under hydrogen atmosphere. The reaction mixture was filtered over a pad of celite and the solvent was eliminated under reduced pressure obtaining the desired product 92 as a white solid. Yield: $50 \%(8.1 \mathrm{mg}, 0.025 \mathrm{mmol}) .{ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.95(\mathrm{~d}, J=8.5 \mathrm{~Hz}$, $2 \mathrm{H}), 6.76(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 5.06(\mathrm{~s}, 1 \mathrm{H}), 4.60(\mathrm{dd}, J=4.7,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.46(\mathrm{dd}, J=$ $14.5,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.23(\mathrm{dd}, J=14.5,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.37(\mathrm{~s}, 9 \mathrm{H})$. MS: calculated for $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{ClN}_{2} \mathrm{NaO}_{4}\left(\mathrm{M}+\mathrm{Na}^{+}\right), 347.0769$; found 347.0767.
