

ENGLISH FRIENDLY COURSES (EFC) 2023-2024 CAMPUS OF BIZKAIA

<u>https://www.ehu.eus/en/web/bilboko-ingeniaritza-</u> <u>eskola/international_relations/incoming_exchange_students</u> **Contact**: <u>ingenieria.internacional@ehu.eus</u>

In addition to the general offer of courses taught in English, some Centers offer for incoming students English Friendly Courses (EFC): subjects taught in Spanish or Basque, in which the syllabus summary; lecturer tutoring, examinations and/or papers are available in English.

English Friendly Courses taught in SPANISH:

Universidad Euskal Herriko del Pais Vasco Unibertsitatea Lesson 18. Introduction to welding processes Lesson 19. Additive Manufacturing Lesson 20. Sintering

TEACHING METHODS

The teaching of the subject is articulated through the following instruments:

- Theoretical and practical classes (M and GA) taught in the classroom, where the teacher will explain the main concepts.

- Industrial workshop practices (TI): Students will be able to analyze the manufacturing processes of different workpieces, perform calculations corresponding to real problems and use instruments and machines similar to those that can be found in an industrial manufacturing workshop.

- Seminars (S): Students will be able to carry out calculations corresponding to machining problems to strengthen the knowledge acquired in the magistral lessons related to the machining module.

The contents of both the industrial workshop practices and the seminars are a necessary complement to the magistral lessons in order to establish the differences between different manufacturing processes and to observe real applications of these to industrial components. Given the importance of both, their content is a subject of examination, as well as the contents of magistral lessons (M) and classroom practices (GA). The industrial workshop practices and the seminars will be carried out by groups in the official schedules of the subject.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	30	6	15					9	
Horas de Actividad No Presencial del Alumno/a	45	9	22,5					13,5

	GL: Applied laboratory-based groups	GO: Applied computer-based groups	GCL: Applied clinical-based groups
	TA: Workshop	TI: Industrial workshop	GCA: Applied fieldwork groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

General features:

- All concepts taught in both theoretical and practical classes are subject to evaluation.

- The pass in the subject will be obtained with a grade equal to or greater than 5 in the corresponding call. In no case will

evaluations be carried out outside the official published dates.

- Only those students who are officially enrolled in the subject may receive the evaluation of the subject.

The evaluation process consists of quantifying to what extent the students have assimilated the fundamental concepts of the subject. The evaluation of the subject is continuous and is made up of a set of written exams.

WRITTEN EXAMS (development and test)

The evaluation of the theoretical-practical part is carried out through a set of written exams. The evaluation system for the written exams is detailed below.

MIDTERM EXAM

Partial exam corresponding to the first three modules of the subject: Dimensional Metrology, Casting and Plastic Forming. It is an optional exam, whose weight on the ordinary call of the subject is 35%. The qualification required in order not to repeat it in the regular exam is 5.

REGULAR EXAM

It is an official exam. It consists of 4 parts:

1. Written exam corresponding to the last two modules of the subject: Machining by Chip Removal and Other Technologies. The weight on the final exam of the subject is 30%.

2. Numerical problem associated with module IV. The weight on the final exam of the subject is 25%.

3. Written exam corresponding to the Industrial Workshop Practices (PTI). The weight on the final exam of the subject is 10%.

4. Written exam corresponding to the first three modules of the subject: Dimensional Metrology, Casting and Plastic Forming. The weight on the final exam of the subject is 35%. This part will not be compulsory if the midterm exam has been passed.

If this call is failed, the complete exam should be taken in the extraordinary call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

It is an official exam which consists of 4 parts:

1. Written exam corresponding to the first three modules of the subject: Dimensional Metrology, Casting and Plastic Forming. The weight on the final exam of the subject is 35%.

2. Written exam corresponding to the last two modules of the subject: Machining by Chip Removal and Other

Technologies. The weight on the final exam of the subject is 30%.

2. Numerical problem associated with module IV. The weight on the final exam of the subject is 25%.

3. Written exam corresponding to the PTI. The weight on the final exam of the subject is 10%.

The student has to take all the parts in order to pass the exam.

LABORATORY PRACTICE: waveguide measurements, network analyser, passive devices measurements, active devices measurements.

Universidad Euskal Herriko del País Vasco Unibertistatea **TEACHING METHODS**

In the lectures of this course the required knowledge will be explained in order to solve problems. The most of the class time will be devoted to solving problems.

In laboratory practice knowledge and skills will be acquired which complement the knowledge acquired in class.

In the event that health conditions prevent the performance of a teaching activity and / or evaluation in person, will activate a mode of non-presence of which students will be informed promptly.

Declining to sit: not attending the final exam call will be considered equivalent to a withdrawal (no examination attempt is used).

In case of health conditions do not allow the face-to-face teaching and/or evaluation activity, and on-line modality will be prepared and the students will be informed.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The students who have passed one section in the ordinary call are not required to do that section exam in the extraordinary call, although they have the option to do it.

In case of the student who does the pass section exam in the extraordinary call, the mark obtained in that section exam of the extraordinary call will be taken to calculate the final mark, even if it is lower than the obtained in the ordinary call.

Declining to sit: not attending the final exam call will be considered equivalent to a withdrawal (no examination attempt is used).

In case of health conditions do not allow the face-to-face teaching and/or evaluation activity, and on-line modality will be prepared and the students will be informed.

ofdr0035

Universidad Euskal Herriko del País Vasco Unibertistatea

The crystal order. Bravais networks. Miller indices. Metallic crystal structures. Other crystal structures. X-ray diffraction.

LESSON 4 Real solids and diffusion.

Defects in the solids. Point defects. Linear defects. Surface defects. Determination of grain size. The amorphous state: polymers and glasses. Thermal behavior of crystalline materials and amorphous materials. Solid state diffusion. Mathematical laws of diffusion. Diffusion coefficient. Industrial processes.

LESSON 5 Phase Diagrams.

Definitions. Solid solutions: Hume-Rothery rules. Gibbs phase rule. Types of phase diagrams: pure substances, binary. Total solubility binary diagrams. Binary diagrams with invariant points: eutectic, peritectic, monotectic. Diagrams with phases and intermediate compounds.

LESSON 6 Mechanical properties of materials.

Introduction. Elastic deformation. Plastic deformation. Tensile properties and stress-strain diagram. Influence of temperature and strain rate. Modeling of behavior in tensile tests. Hardness. Fracture and Charpy test. Fatigue. Creep.

LESSON 7 Metallic materials.

Ferrous materials: Manufacture of steels and cast irons. Types of steel: metal construction, stainless, tool steels. Types of cast irons. Aluminum and its alloys. Copper and its alloys. Titanium and its alloys. Other non-ferrous alloys. Thermal treatments of metallic materials.

LESSON 8 Polymeric and composite materials.

Polymer structure. Molecular weight distribution. Families of polymeric materials. Shape, structure and molecular conformation. Crystallinity in polymers. Mechanical behavior of polymers. Viscoelasticity. Fracture. Thermoplastic, thermosetting and elastomeric polymers. Manufacturing. Additives. Composite materials. Reinforcing fibers and particles. Laminar and structural compounds.

LESSON 9 Ceramic materials.

Obtaining and properties. Classic ceramics: bricks, tiles, porcelain, earthenware, stoneware. Technical ceramics: alumina, zirconia, silicon carbide, silicon nitride. Glasses: Manufacturing, properties and applications. Vitroceramics: properties and applications.

LESSON 10 Electrical properties. Semiconductor materials.

Electrical conduction in metals. Ohm's law. Band theory. Microscopic model of conduction. Matthiessen's rule. Electrical conduction in semiconductors. Intrinsic and extrinsic semiconductors. Band theory. Fermi level. Hall effect. p-n junction. Dielectric properties: capacitance, dielectric constant and polarization. Applications of dielectric materials. Ferroelectric and piezoelectric materials. Applications.

LESSON 11 Magnetic Properties.

Introduction. Microscopic origin of magnetism. Magnetic field intensity. Magnetic susceptibility and permeability. Diamagnetism. Paramagnetism. Ferromagnetism. Antiferromagnetism. Ferrimagnetism. Hysteresis. Structure of the magnetic domains. Hard and soft magnetic materials. families and applications. Hard and soft ferrimagnetic materials. families and applications.

LESSON 12 Superconducting Materials (SC).

Historical introduction. Perfect conductor and perfect diamagnetic. Meissner effect. Magnetic levitation. SC type I. BCS theory and Cooper pairs. Critical field and critical current. SC type II. High temperature SC. Irreversible field. SC materials and applications.

LESSON 13 Optical properties.

Introduction. Light and the electromagnetic spectrum. Light refraction Absorption, transmission and reflection. Luminescence. Lasers. Optical fibers.

TEACHING METHODS

In the master classes, extensive explanations will be given by the teacher with the help of the projection of the presentations, that will also be available to the students both electronically in the virtual classroom (eGela) and printed in the reprography service of the center.

In the seminars, teaching will be focused on specific topics that require complementary exercises to encourage teamwork and student participation with occasional debates. In this way it is possible to deepen the theoretical knowledge of the subject in a more practical and application focused way.

COURSE GUIDE 2023/24	
Faculty 345 - Faculty of Engineering - Bilbao	Cycle .
Degree GITECI30 - Bachelor`s Degree in Industrial Technology Engineering	Year Third year
COURSE	
27317 - Elasticity and Strength of Materials	Credits, ECTS: 6
COURSE DESCRIPTION	
The engineer dedicated to the design of structures and mechanical elements must own an in practical knowledge. In particular, he should be able to explain the relationship between a particular.	•

practical knowledge. In particular, he should be able to explain the relationship between a particular structural member with the stresses to which it may be subjected, either in the form of applied forces, temperature variations, support displacements, etc., and the stresses and strains originated in the structure, all of which constitute the primary object of the "Elasticity and Strength of Materials". Among the different types of structures that could be considered, the course focuses on the analysis of structures formed by prismatic bars.

The content of the course is divided into two distinct blocks. After a first subject in which the student is introduced into the behavior of deformable solids and the concept of structure, in the following four topics the basics of the Theory of Elasticity are presented: stresses, strains, constitutive laws and elastic problem resolution, with particular attention to the problems of two-dimensional elasticity and a brief presentation of the most relevant experimental methods to obtain stresses and strains. This first block is concluded with a theme, theories of failure, which serves as a transition between the field of Elasticity and the following topics belonging more specifically to the Strength of Materials.

In the first topic of the second block, after describing the different types of structures formed by prismatic bars, the analysis of section forces and moments is addressed in these elements. A theme is dedicated to the analysis of simple lattices subjected to axial forces. In the last two themes the stresses and strains caused in pure bending and simple bending are studied, and this knowledge is applied to the resolution of isostatic structures.

This course is part of the curricular line of Mechanical Engineering and, therefore, is based on the subjects of 2nd course "Mechanics" and "Applied Mechanics" whose knowledge and mastery are essential to understand the behavior of structures and other mechanical parts considered as deformable solids. Obviously, the student should also have a good grasp of the fundamental concepts of "Algebra" and "Calculus" studied in the first year. Another link can also be found with another subject taught in the third year, "Theory of Mechanisms and Mechanical Vibrations", a discipline that helps determine the forces undergone by the elements of a mechanism, and from which stresses and strains can be obtained by means of the "Elasticity and Strength of Materials". In this way a proper design ensuring system integrity can be obtained. The knowledge acquired in this subject also form the basis of other mechanical-type subjects of the fourth year such as "Theory of Structures and Construction", where new methods are shown in the calculation of structures formed by prismatic bars. It is also evident the relationship with the subjects "Theory of Machines" and "Machine Elements", where it is essential to obtain stresses and strains and to apply the corresponding theories of failure. Finally, the "Elasticity and Strength of Materials" is also basic for some subjects included in several Master courses: in the "Master in Mechanical Engineering" (a continuation of the Degree in Mechanical Engineering) and in the "Master in Industrial Engineering" (a continuation of the Degree in Mechanical Engineering).

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT

The competence of the subject, for the common module of the Industrial Branch, and reflected in the memory of the degree is:

- Knowledge and use of the principles of strength of materials.

As a result of learning it is expected that the students are able to:

- Acquire the basic knowledge governing the Theory of Elasticity, fundamental for analyzing the behavior of deformable solids and therefore for the analysis of Strength of Materials.

- Establish the basic equations in the analysis of solids with linear elastic behavior and the range of application of the linear-elastic theory.

- Know the criteria for the selection and use of different failure theories in the calculation of structures.

- Become familiar with some of the experimental techniques used in the calculation of stresses and strains in structures.

- Be able to calculate the stresses and strains in lattices, both isostatic and statically indeterminate. For these latter

structures special emphasis is placed on the use of the force method.

- Be able to determine the stresses and strains in isostatic structures subjected to bending.

Theoretical and Practical Contents

THEORETICAL CONTENTS

- 1. INTRODUCTION
- 2. CONCEPT OF STRESS
- 3. GENERAL THEORY OF STRAIN
- 4. THE ELASTIC SOLID
- 5. THE ELASTIC PROBLEM 6. THEORIES OF FAILURE

7. INTRODUCTION TO THE STRENGTH OF MATERIALS. PRISMATIC BAR STRUCTURES 8. AXIAL FORCE IN A TRUSS STRUCTURE 9. GENERAL THEORY OF BENDING. STRESS ANALYSIS **10. GENERAL THEORY OF BENDING. STRAIN ANALYSIS**

LABORATORY PRACTICES SESSION 1. THE TENSION TEST SESSION 2. EXTENSOMETRY

TEACHING METHODS

The contents of the subject "Elasticity and Strength of Materials" are taught through lectures, practical classes, seminars and laboratory practice.

In the lectures the contents and theoretical concepts of each topic are presented with the aid of some specific publications available to the student and by the resolution of practical exercises.

In the practical classes problems based on structures and mechanical systems are solved in order to consolidate the concepts presented in the lectures.

Throughout the semester three seminars are held, in which larger problems as well as exams of previous editions are solved. The arrangement in small seminar groups propitiates an interactive resolution of problems between the professor and the students.

Along the course two laboratory practices are performed, the first corresponding to the tension test and the second dedicated to the experimental measurement method of extensometry. The practices are carried out in the "Laboratory of Strength of Materials and Structures" of the Department of Mechanical Engineering. Previously, and depending on each practice, students individually or divided into groups initially attend a theoretical presentation and solve analytically some exercise related to the practice. During the session, students are divided into smaller groups so as to carry out experimental measurements and validate their calculations. At the end of each practice, students must submit a report with the results and final conclusions.

On the virtual platform eGela, the following material is available to the students: the Student Guide, a collection of review exercises, some problems to be solved in the seminars and other problems from the examination sessions, together with the results and exam grades. All subject groups have at their disposal the same material simultaneously.

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 95%

- Exercises, cases or problem sets 5%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In this subject a partial exam is proposed that allows reducing contents in the final exam. It will be assumed that by not doing or not obtaining the required grade in this partial exam the student is giving up the continuous assessment system. The requirements for passing the course are:

1. Attend all laboratory practices.

2. Get an average rating greater than or equal to 5.0.

The laboratory practices account for 5% and the written tests for 95% of the final grade. The written tests consist of individual resolution of problems and theoretical questions. The first written test enables to pass definitively the first part of the course (for this it is necessary to obtain a rating equal to or greater than 4.0). In the second part of the course, a score equal to or greater than 3.5 should be obtained in order to be able to get a pass average. The final grade is the average of the two partial tests. Students may also make a full examination even after having passed the first of the written tests. The theoretical part of the exam is in any case one third of the mark for each exam.

According to the current regulations of the University of the Basque Country - EHU, it is sufficient for the student not to present himself to give up the corresponding call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary examination a written exam including the full course will be performed. This will consist of individual resolution of problems and theoretical questions. The theoretical part accounts for one third of the exam. The final grade will be obtained by taking the laboratory practices into account.

As in the ordinary call, to give up this call it will be sufficient for the student not to present himself.

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT		
As the verified report of the Degree in Industrial Technology Engineering states, the skills and developed in this subject are:	learning outco	omes to be
-M02R6 Knowledge of the basics of automatic systems and control methods.		
-LO Automatic and control Systems design for machines and industrial facilities.		
Theoretical and Practical Contents LECTURES:		

Universidad Euskal Herriko del Pais Vasco Unibertsitatea Lesson 1 Introduction. Open and Closed Loop control. Automatic and Manual Control. Main variables identification. Block Diagram of a system. Feedback Loop. Elements of the control loop.

Lesson 2 Dynamic System Modelling and External Representation. System Mathematical Modelling. Linearization. Laplace transform. Differential equations and transfer function.

Lesson 3 Time Domain Analysis. Test signals. Time response of first order, second order and great order systems. Experimental system identification.

Lesson 4 Feedback System Analysis. Feedback Systems. Stability of Feedback Systems. Definition and creation of the Root Locus. Steady state error analysis.

Lesson 5 Control System Design. PID Control: actions and parameters. Common algorithms. PID design and tuning approaches. Experiment-based design methods. Model-based analytical design methods.

Lesson 6 Frequency Domain Analysis. Transfer Function and Frequency response relationship. Identification of systems based on the frequency response.

LABORATORY SESSIONS:

The laboratory sessions are essential to acquire the knowledge on control systems and emphasize the basic concepts of Automatics and Control subject.

P1: Experimental indentification (with real scale models)

P2: Feedback systems and Root Locus (in simulation)

P3: Experimental Design of PID Controllers (in simulation)

P4-5: Analythical Design of PID Controllers (with real scale models)

TEACHING METHODS

The aim of the subject is to provide the student with the necessary tools to design a control system, applying the basic control concepts to each step of the design process: modelling, analysis and design.

The lectures are used to explain the theoretical concepts while emphasizing their importance and their application context.

The seminars are used to strengthen the theoretical concepts by means of the resolution of practical exercises. In some sessions, concepts related with the laboratory sessions will be analysed, so that the preparation work required for the Laboratory Sessions is reinforced. Moreover, students are encouraged to work in teams to discuss their design results.

The laboratory sessions are focused on the different stages of a control system design and validation. Some of these sessions are focused on using real scale processes in which students work in teams, while others are based on the use of simulation software that will be handled individually.

In order to get the most of the seminars and the laboratory sessions, a proper preparation work is mandatory. The Seminar and Laboratory Notebook is the required tool to achieve this goal.

This way, students will fill the exercises and questions proposed in this notebook prior and during these sessions. This Notebook could be required by the lecturers at any time to analyse the progression of the students and provide with feedback.

All the information related with the subject (theory, simulation software) is available in the virtual platform eGELA: https://egela.ehu.es/. Hence, students should access regularly to the web page, as it will, in addition, be used to notify students with all matters related to the subject.

NOTE: If the sanitary conditions fue to the pandemic do not allow in-person activity or evaluation, a telematic mode will be activated.

SOFTWARE USED:

-Labview based tool: Analysis, simulation and control tool for real scale models

-Virtual Platform (eGELA):Communication platform in which students will find the information related with the subject. -MATLAB: Control and Simulation tool

TYPES OF TEACHING S GA GL GO GCL TA ΤI GCA Μ Types of teaching Hours of face-to-face teaching 37,5 15 7,5 Horas de Actividad No Presencial del Alumno/a 56,25 22,5 11,25 Legend: M: Lecture-based S: Seminar GA: Applied classroom-based groups GCL: Applied clinical-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups TI: Industrial workshop TA: Workshop GCA: Applied fieldwork groups **Evaluation methods** - Continuous evaluation - End-of-course evaluation Evaluation tools and percentages of final mark - Written test, open questions 50% - Multiple choice test 40% - Exercises, cases or problem sets 10% **ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT** The course introduces concepts related to the analysis of systems in the time domain and the effect of feedback (T1-4), to later combine all the concepts together with analytical and experimental techniques that allow the definition of controllers for this system (T5) and even extend it to the frequency domain (T6). Therefore, the subject has an incremental development of concepts, in which it is essential that students have correctly internalised the concepts of the first topics, in order to be able to tackle the final objective of the subject: the design of controllers. In order to promote learning, the assessment of the subject is established continuously throughout the course by means of three main milestones: -Intermediate Written Exam (40%): Evaluates the basic concepts and fundamentals of Topics 1 to 4. This test will be in the format test+ justification. Given the importance of the basic concepts to progress in the subject, a minimum of 40% will be required for the test to count towards the average. -Controller design practice in the laboratory (10%): The final practical session of the course will allow students to face the design of several controllers with one of the real mock-ups in the laboratory. The controllers designed and validated by the students will be evaluated at the end of the practical session. -Final Written Exam (50%): It will evaluate if the student has achieved the learning outcome associated to the subject, the ability to design control systems. For this, the student will have to apply the techniques of T5-6, in addition to the concepts of topics T1-4. This exam will take place on the official date set by the centre for the exam associated with the ordinary call. A minimum of 40% will be required for this exam to count towards the average. In order to pass the subject in the ordinary exam, a total score equal to or higher than 5 points must be achieved by means of the three instruments indicated above, in addition to a mark higher than 40% in the intermediate written exam and the final written exam. In the event that a student does not achieve the required 40% in the Intermediate Written Exam, the continuous assessment mentioned above will not be taken into account and the Final Assessment mechanism detailed in the section on Resignation to the continuous evaluation will be applied directly. In the event that in the Final Written Exam a student does not pass the required 40%, the maximum mark that may appear in the ordinary call will be a 4.5 out of 10. **RESIGNATION TO THE CONTINUOUS EVALUATION** The resignation will be materialised by the student's NON-APPEARANCE to the Intermediate Written Exam Those students who resign to the continuous evaluation will have to accredit the achievement of knowledge and competences of the whole subject through the Final Written Exam (50% of the final grade) and a Complementary Exam (50% of the final grade). The Complementary Exam may be a multiple-choice test, short answers, problems or a combination of the above.

This structure will be maintained in both the ordinary and extraordinary calls.

RESIGNATION TO THE EVALUATION

The unattendance to the official final exam, will automatically imply a resignation to the call. The resignation to the ordinary or extraordinary call will imply a "No-Show" mark.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The final mark in the extraordinary exam will be awarded following the Final Assessment mechanism detailed in the Resignation to the Continuous Evaluation of the Ordinary Call:

-Extraordinary Final Written Exam (50%): It will have similar characteristics to those of the ordinary exam. In this test a minimum of 40% will be required to count towards the average.

-Complementary Exam (50%): It will be able to evaluate concepts and techniques of the whole subject by means of multiple-choice questions, short answers, development of problems or a combination of the previous ones.

Students who have not resigned to the continuous evaluation will keep the grade of the Intermediate Written Exam (40%) and the grade related to the Controller design practice in the laboratory (10%), so they will not have to take the Complementary Exam. In any case, if a student wishes to evaluate 100% of the course, he/she can do so by sending an e-mail to the Course Coordinator at least one month before the Extraordinary Final Written Exam.

In order to pass the course in the Extraordinary Call, a total score equal to or higher than 5 points must be achieved by means of the above-mentioned assessment instruments, and it is compulsory to obtain 40% in the Extraordinary Final Written Exam. In case of not achieving it, the grade that will appear in GAUR application will be a maximum of 4.5 (out of 10).

RESIGNATION TO THE EVALUATION

The unattendance to the official final exam, will automatically imply a resignation to the call. The resignation to the ordinary or extraordinary call will imply a "No-Show" mark.

MANDATORY MATERIALS

All the mandatory materials are available in eGela virtual room.

The Laboratory and Seminar Notebook is also available at the Faculty publication Service platform.

SOFWARE TOOLS:

-Labview-based software tool for simulation and control of real time systems such as the processes analyzed in the laboratory.

-eGELA virtual platform for subject notes, information and general issues, available for all students

-Matlab: Students have access to the corporate educational license as members of the UPV/EHU.

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT			
The competence of the subject corresponding to the module Specific Technologies, and	d reflected in the	e memory of	the
degree is: - Knowledge and ability to apply the fundamentals of elasticity and strength of materials	to the behavio	r of real solic	ls.
As a result of learning it is expected that the students are able to: - Understand the fundamentals of calculation of statically indeterminate structures with	particular emph	asis on the r	nethor
of forces and master the resolution of simple structures composed of prismatic bars.			
 Complete calculation of stresses and strains in structures subjected to different types in circular prismatic bars. 	of forces includ	ing torsion e	ffects
- Acquire the skills to carry out the advanced analysis of bars under biaxial or unsymme	etrical bending.		
 Know the procedures for calculating heterogeneous sections subjected to pure bendir transformed section method and the static method. 	ng and be able t	o apply the	
- Master the analysis of elements subjected to eccentric compression, both in materials	with similar bel	navior in tens	sion
and compression, and those that do not support tensile stresses.			
 Acquire theoretical analysis methods for calculating supports against buckling under c with the standards-based calculation (Technical Standards for Building). 	compression and	a become fa	miliar
- Be able to use as an alternative energy methods to calculate both isostatic and statica	ally indeterminat	e structures	,
understanding the meaning of the fundamental energy theorems. - Know the method of the equivalent static load to solve impact loads on structures with	both linear and	Inonlinear	
behavior.

LABORATORY PRACTICES PRACTICE SESSION 1. PHOTOELASTICITY PRACTICE SESSION 2. BENDING OF BEAMS

TEACHING METHODS

The contents of the subject "Solid Elastic Calculation" are taught through lectures, practical classes, seminars and laboratory practice.

In the lectures the contents and theoretical concepts of each topic are presented with the aid of some specific publications available to the student and by the resolution of practical exercises.

In the practical classes problems based on structures and mechanical systems are solved in order to consolidate the concepts presented in the lectures.

Throughout the semester three seminars are held, in which larger problems as well as exams of previous editions are solved. The arrangement in small seminar groups propitiates an interactive resolution of problems between the professor and the students.

Along the course two laboratory practices are performed, the first corresponding to a photoelasticity test and the second consisting of the measurement of reactions and deformations in beams subjected to bending. The practices are carried out in the "Laboratory of Strength of Materials and Structures" of the Department of Mechanical Engineering. Previously, and depending on each practice, students individually or divided into groups initially attend a theoretical presentation and solve analytically some exercise related to the practice prior year. During the session, students are divided into smaller groups so as to carry out experimental measurements and validate their calculations. At the end of each practice, students must submit a report with the results and final conclusions.

On the virtual platform eGela, the following material is available to the students: the Student Guide, a collection of review exercises, some problems to be solved in the seminars and other problems from the examination sessions, together with the results and exam grades. All subject groups have at their disposal the same material simultaneously.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	30	4,5	22,5					3	
Horas de Actividad No Presencial del Alumno/a	45	6,75	33,75					4,5

GA: Applied classroom-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 95%

- Exercises, cases or problem sets 5%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In this subject a partial exam is proposed that allows reducing contents in the final exam. It will be assumed that by not doing or not obtaining the required grade in this partial exam the student is giving up the continuous assessment system. The requirements for passing the course are:

1. Attend all laboratory practices.

2. Get an average rating greater than or equal to 5.0.

The laboratory practices account for 5% and the written tests for 95% of the final grade. The written tests consist of individual resolution of problems and theoretical questions. The first written test enables to pass definitively the first part of the course (for this it is necessary to obtain a rating equal to or greater than 4.0). In the second part of the course, a score equal to or greater than 3.5 should be obtained in order to be able to get a pass average. The final grade is the average of the two partial tests. Students may also make a full examination even after having passed the first of the written tests. The theoretical part of the exam is in any case one third of the mark for each exam.

According to the current regulations of the University of the Basque Country - EHU, it is sufficient for the student not to present himself to give up the corresponding call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary examination a written exam including the full course will be performed. This will consist of individual

resolution of problems and theoretical questions. The theoretical part accounts for one third of the exam. The final grade will be obtained by taking the laboratory practices into account.

As in the ordinary call, to give up this call it will be sufficient for the student not to present himself.

COURSE DESCRIPTION	
The subject "Engineering Projects" is a common subject that is given in the Degree o Technology. The subject develops the capacity of the student to combine knowledge career to apply them in the develops of projects of engineering, having in counts espec resources, organizational aspects, quality, risks and respect to the environment. Equa of information. The topics of the theoretical part consist of exposing questions related projects of Engineering in its different phases. The practical part is about the application several individual and in group practices.	e and attitudes acquired along the ecially the cost limitations, time, ally it develops the capacity of sea d to the managing and timing of

NAZIOARTEKO BIKAINTASUN CAMPUSA CAMPUS DE EXCELENCIA INTERNACIONA

rsidad Vasco Unibertsitatea

ofdr0035

material suitable to approach the course.

The seminars will focus on specific topics, where students will advance their expertise by means of teamwork and occasional debates around case studies. In this way, the syllabus-contents about those topics is attained in a practical and applied way.

In the laboratory practices, a small team project will be developed. It entails experimental work in the metallurgylaboratory in order to acquire knowledge and expertise about experimental techniques, as well as analysis and decisionmaking skills.

In the event that minimum distances between students are established for health-safety reasons, the practices will be organized on a delegated basis and, likewise the rest of the teaching modalities, the conditions indicated by the EIB management team will apply. Also, in the event that face-to-face assessment cannot be carried out, the pertinent changes will be made to carry out an online evaluation by using the existing computer tools at the UPV/EHU. The characteristics of this online evaluation will be published in eGela.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	37,5	7,5	7,5	7,5					
Horas de Actividad No Presencial del Alumno/a	56,25	11,25	11,25	11,25					

S: Seminar

Legend: M: Lecture-based

TI: Industrial workshop

GA: Applied classroom-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 45%

TA: Workshop

- Exercises, cases or problem sets 20%
- Teamwork assignments (problem solving, Project design) 25%
- PRACTICAS DE LABORATORIO 10%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A continuous assessment methodology will be used, with several activities and tasks. The weighting will be as follows:

-Final assessment test, including exercises and theoretical questions: 45% of the final grade.

Syllabus content comprehension and expertise in solving practical exercises. Assessment of the skills for autonomous work.

- Completion of various tasks and activities throughout the course: 20% of the final grade. Achievement degree of several syllabus topics (theoretical background and practical exercises).

- Written reports, poster presentations and oral communication of the work carried out in the Seminars: 25% final grade.

Assessment of the skills and expertise to use theoretical and practical knowledge to solve open problems and case studies.

Assessment of the skills and expertise for teamwork by presenting proposals, analyzing other members´contributions, discussing ideas and executing pertinent actions. Interpersonal skills.

-Writing a report and a visual presentation about the Laboratory project, and presenting it face to face to the class: 10% of the final grade.

Assessment of the skills to approach a poorly defined task, which needs to develop a plan for the required steps, to execute them experimentally, to analyze critically the obtained results, to propose solutions and to communicate them, both in writing and orally. All of it as part of a team.

It is compulsory to carry out all the tasks, tests and activities scheduled in the continuous evaluation. A score above 5 out of 10 must be obtained in each of them. Exceptionally, students may pass with a Final assessment test score higher than 4.5 out of 10, as long as the rest of the activities and tests evaluated in the course have a grade higher than 5 out of 10.

Students have the right to waive the continuous assessment and opt for the assessment according to one single final assessment test. The students who choose this option must inform the teacher before week 12th. In this case, the final test will contain questions and exercises regarding all the topics and aspects approached along the course in all the teaching modalities.

The students have the right to revoke the assessment of the current course. No notification to the teacher is required in that case. By default, any student who does not take the final assessment test revokes the assessment of the course.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A final assessment test will be held for 100% of the final mark. It will contain questions and exercises questions and exercises regarding all the topics and aspects approached along the course in all the teaching modalities.

Students who, having done continuous assessment during the ordinary assessment period, passed all the assessed activities except for the final assessment test, may choose to keep the grade obtained in those activities. In that case, a final assessment test in the extraordinary call will be 45% of the final grade, as long as the minimum grade obtained in it is 4 out of 10.

By default, the students who do not take this final assessment test revoke the assessment of the course.

Universidad Euskal Herriko del Pais Vasco Unibertsitatea

- A first description of the MEF and its use in mechanical design
- 1. Product Development Cycle
- 2. Brief historical description and MEF bases
- 3. Functions of interpolation, natural coordinates and approximate solution.
- 4. Basic relations in an element
- 5. Calculation of the stiffness matrix of an element
- 6. Stiffness matrix model, boundary conditions, properties

Chapter 2 Analysis of two-dimensional models

- 1. Types and applications of two dimensional analysis in machine design
- 2. Properties and applications truss and beam elements
- 3. Triangular and quadrilateral linear element
- 4. Other elements; higher order and transition

Chapter 3

Analysis of three-dimensional models

- 1. Overview of three-dimensional analysis
- 2. Elements bar and beam
- 3. General considerations on the solid elements
- 4. Finite element models of plates and shells

Chapter 4

Mechanical properties and material selection

- 1. Selection of materials
- 2. Qualitative Properties
- 3. Quantitative Properties
- 4. Local effects; stress concentration
- 5. Stress concentration coefficients
- 6. Factors that contribute brittle failure in ductile materials

Chapter 5

Safety factor and failure theories in machine design

- 1. Necessity of the safety factor
- 2. Influence of material and method of analysis
- 3. Selection of safety factors
- 4. Theories of static failure in machine design

Chapter 6 Introduction to material fatigue

- 1. Analysis with variable solicitations: quasi-static and dynamic cases
- 2. Background and current status
- 3. Qualitative aspects of fatigue
- 4. Fatigue tests

Chapter 7

Material fatigue with uniaxial alternating stresses

- 1. Theories for fatigue analysis
- 2. Resistance to fatigue and fatigue limit
- 3. Modifying factors of fatigue limit
- 4. Stresses concentration and notch sensitivity
- 5. Modifying factors for finite life; Basquin equation

Chapter 8

Fatigue analysis with nonzero mean stress

1. Fatigue with mean stresses; Haigh diagram

2. Criteria for the Haigh diagram in ductile materials

- 3. Criteria for the Haigh diagram in brittle materials
- 4. Safety factor; equivalence stresses
- 5. Safety margin; equivalence duration
- 6. Treatment of stress concentration

Chapter 9 Cumulative damage

- 1. Cumulative Damage: Palmgren-Miner method
- 2. Cumulative Damage: modification of Manson
- 3. Procedures for cycle counting

Chapter 10 Fatigue analysis with multiaxial stress

- 1. General considerations on multiaxial fatigue
- 2. Multiaxial simple state with alternating stresses
- 3. Multiaxial simple state with nonzero mean stresses
- 4. Classic treatment of complex multiaxial states
- 5. Methods for global approach and critical plane

Chapter 11

Linear Fracture Mechanics for Fatigue

- 1. Basic concepts of fracture mechanics
- 2. Fatigue crack propagation; applying Paris equation
- 3. Delay effects caused by overload
- 4. Prediction of crack growth

Computer practices (PO)

Chapter PO1

Practical considerations about finite element programs

- 1. Organization of a Finite Element program
- 2. Outline of use of computer program
- 3. A basic example of modeling

Chapter PO2

Analysis of two-dimensional models

- 1. Examples with truss and beam elements
- 2. Examples with two-dimensional elements: plane stress, plane strain, axisymmetric
- 3. Examples with combination of different types of 2D elements

Chapter PO3

Analysis of three-dimensional models

- 1. Examples with truss and beam elements
- 2. Examples with solid elements
- 3. Examples shell elements
- 4. Examples with combination of different types of 3D elements

Chapter PO 4

- Test and fatigue design practice
- 1. Computer programs for fatigue analysis
- 2. Fatigue design using finite element method
- 3. Comparison and practical considerations

TEACHING METHODS

The course consists of lectures, classroom practices and computer practices.

1. Lectures

It is the fundamental part of the subject, teachers expose classroom lessons interacting with students. For the successful use of these classes, students will have previously basic information corresponding to the lesson taught. Classes are primarily based on developments made on the board with computer presentations.

2. Classroom practices

Troubleshooting and practical approach to learning to select the most appropriate design method to each case and apply the methods and calculation procedures outlined in the theory classes and practical method of computer cases.

3. Individual and group tutorials

The tutorial classes serve to elucidate and reinforce those aspects of the subject that need the student, after attending class and done prior study work. The teachers of the subject will be available in the hours devoted to tutoring published in the GAUR application of the UPV / EHU. The place for tutoring will be the office of each professor in the Department of Mechanical Engineering of Bilbao ETSI

4. Virtual Teaching Platform

On the platform egela-EHU is available to the students notes and miscellaneous information to facilitate monitoring of the course. Specifically, the Student Guide, scripts computer practices, exams of previous years are published. Likewise, the establishment of forums will be promoted to encourage student participation and facilitate cooperative learning

TYPES OF TEACHING

	Types of teaching	Μ	S	GA	GL	GO	GCL	TA	TI	GCA

Evaluation methods

Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 75%

- Teamwork assignments (problem solving, Project design) 25%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Students will have the opportunity to be evaluated through a single exam, according to the official call. A minimum mark of 5 points out of 10 will be required to pass the subject. In no case will the final exam be held out the official published date. The exam will have 3 tests. The first test will evaluate the knowledge acquired by the student in the first part of the subject, and will have a weight of a 30% over the final mark. The second test will evaluate the knowledge acquired by the student in the second part of the subject, and will have a weight of a 45% over the final mark. The third test will evaluate the knowledge acquired by the student in the second part of the subject, and will have a weight of a 45% over the final mark. The third test will evaluate the knowledge acquired by the student in the computer practices, and will have a weight of a 25% over the final mark. In the ordinary call, students will also have the opportunity to choose a continuous evaluation according to the next criterion:

- Mid-term exam:
- Weight over the final mark: %30.
- · Content: first part of the subject.
- Minimum grade: 3,5 out of 10.
- Final exam:
- * If more than 3,5 in the mid-term exam:
- Weight over the final mark: %45.
- · Content: second part of the subject.

• Minimum grade: 3,5 out of 10. The average with the mid-term exam must be greater than 5 out of 10 to pass the subject.

* If less than 3,5 in the mid-term exam or to improve previously obtained mark (the mark of the mid-term exam would not be considered in this case):

- Weight over the final mark: %75.
- · Content: the whole subject.
- Minimum grade: 5 out of 10.
- Team work:
- Weight over the final mark: %25.

Content: a design or analysis study of a component using the Finite Element Method. Fatigue analysis methods can also be used.

· Minimum attendance: %80 of the computer classes.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary call, students will be evaluated through a single exam, according to the official call. A minimum mark of 5 points out of 10 will be required to pass the subject. In no case will the final exam be held out the official published date. The exam will consist of a single test, which will include the contents taught both in the theoretical and computer classes.

MANDATORY MATERIALS

Regarding the support material for the theoretical content, in the Library of the Engineering School, the student has a very extensive bibliography of consultation on the topics covered in this subject; those students who wish, have available in the Publications Service of the Engineering School the books entitled: "MÉTODOS DE ANÁLISIS PARA DISEÑO MECÁNICO: Vol. II." and "MÉTODOS DE CÁLCULO DE FATIGA PARA INGENIERÍA" Paraninfo publisher. For class problems there are notes in the Publications Department of the School: "CUADERNO DE EJERCICIOS DE CLASE: TECNOLOGÍA DE MATERIALES Y DISEÑO DE MÁQUINAS ". Also, on the website, http://egela.ehu.es, computer practices about finite element method, some figures, previous exam, photographs of interest, links to other pages and content of computer practices are linked.

Serious conceptual errors will be penalized in the correction. - Evaluation of laboratory practices through monitoring and reporting. Attendance to laboratory practices is mandatory. Students will deliver a complete report for each practice carried out, which will be assessed with a grade from 0 to 10. These reports will assess the application of knowledge to practical applications as well as the calculation of errors and their interpretation. The practice mark will be the average of the marks obtained in the practices carried out. The final mark will be calculated according to the following percentages: Practice mark (20%) Final exam mark (80%) To pass the course, it will be a necessary condition to have passed the practices, have a minimum mark of 5.0 in the final exam and have obtained an overall mark equal to or greater than 5.0. In the case of continuous assessment, students may waive the call within a period that, at least, will be up to one month before the end of the teaching period for the subject. This resignation must be submitted in writing to the teaching staff responsible for the subject. B) The students who want to be evaluated through the final evaluation system must present in writing to the coordinator responsible for the subject the waiver of continuous evaluation, for which they will have a period of 9 weeks, counting from the beginning of the semester, according to the academic calendar of the center. In this case, the learning results will be

-A final exam that will include the resolution of exercises and the development of a theoretical topic: The following will be valued: the degree of knowledge of the basic principles of Optics, the precision in the arguments, the obtaining of exact numerical values, the appropriate use of units, the completeness of the solutions, the correct use of verbal, mathematical and / or language. or graphic. Serious conceptual errors will be penalized in the correction.

- A practical exam that will be carried out in the laboratory and will last three hours. In this exam, they must make a report of a practice that must contain: obtaining and mathematical treatment and graphing of experimental data, calculation of errors, discussion of results and conclusions of the work.

The final mark will be calculated according to the following percentages: Practice exam mark (20%) Final exam mark (80%)

evaluated through a test, consisting of:

To pass the course, it will be a necessary condition to pass the practical exam and have obtained an overall mark equal to or greater than 5.0.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The following evaluation tools will be used:

- A final exam that will include the resolution of exercises and the development of a theoretical topic. The following will be valued: the degree of knowledge of the basic principles of Optics, the precision in the arguments, the obtaining of exact numerical values, the appropriate use of units, the completeness of the solutions, the correct use of verbal, mathematical and / or language. or graphic. Serious conceptual errors will be penalized in the correction.

- A practical exam to be carried out in the laboratory. Those students who have not passed the practices during the course must take a practice exam that will be carried out in the laboratory and will last three hours. In this exam, they must make a report of a practice that must contain: obtaining and mathematical treatment and graphing of experimental data, calculation of errors, discussion of results and conclusions of the work.

The final mark will be calculated according to the following percentages: Practice exam mark (20%) Final exam mark (80%)

To pass the course, it will be a necessary condition to have passed the practices, have a minimum mark of 5.0 in the final exam and have obtained an overall mark equal to or greater than 5.0.

SEMINAR SUBJECTS: DEVELOPMENT:

- 1st Seminar: Description of the industrial automation systems
- 2nd Seminar: Building blocks
- 3rd Seminar: SFC design (GRAFCET)
- 4th Seminar: Process data access communications
- 5th Seminar: Control communications
- 6th Seminar: High level communications
- 7td Seminar: Final Project

PRACTICAL SUBJECTS: DEVELOPMENT:

- 1st Practice: Development environment
- 2nd Practice: Combinational Systems
- 3rd Practice: Sequential Systems 1/2
- 4th Practice: Decentralized peripherals communications
- 5th Practice: Control communications
- 6th Practice: High level communications
- 7th Practice: Final Project

TEACHING METHODS

In this course several methodologies are used, depending on the type of education:

- Master Lecture: Offering brief presentations of theoretical content will be taught by the teacher, carrying out various individual activities by the student.

- Seminary Mode: Brief theoretical/practical exhibitions will be taught by the teacher, devoting part of the on-site time to the realization of individual and group activities.

- Laboratory Model: Different works about case of concept in which implement the contents in lectures and seminar in order to strengthen both autonomous and group work .

A final group work will be is performed for the resolution of a case study that will bring together the different methodologies and technologies developed in the different modes.

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Written Test: 30% (Pass score 40%)

Seminar/Laboratory: 70% (Continuous Assessment)Disposition for Seminar Sessions: 10% (Independent work - Pass score 50%)Laboratory Practices:30% (Independent work - Pass score 50%)Final work:30% (Group work - Pass score 50%)

The renounce to the ordinary call or to the continuous assessment will be notified personally and in the format agreed at the start of the course, to the coordinator or teacher of the course, 2 weeks before the end of the quarter in which the subject is taught.

In case of renounce to the continuous assessment, a seminar/laboratory test will be made.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Written Test: 30% (Pass score 50%) Laboratory Test: 70% (Pass score 50%)

The renounce to the extraordinary call will be notified personally and in the format agreed at the start of the course, to the coordinator or teacher of the course, 2 weeks before the date of the resist exam of the subject.

MANDATORY MATERIALS

Students will be equipped with the informatics (software) needed for the development of the different works:

- Tools for hardware devices configuration
- Programming tools for the devices
- Programming tools for communications

CONTENIDOS TEÓRICO-PRÁCTICOS

1.-Basic concepts and foundations of telecommunication networks and services What is a telecommunication network, elements, topologies, services, applications ... Architecture of a telecommunications network: - Terminal systems - Access network: technologies, dedicated / shared link ... - Network core: Switching functions (circuits / packets, connection oriented / non-connection oriented), multiplexing (FDM / TDM / statistics) Internet backbones, ISPs Protocol layers / Service models 2.-Application layer Principles of network applications Basic applications: web browsing, file transfer, email, name resolution, p2p applications 3.-Transport Layer The transport layer and its services Unreliable transport: UDP Reliable transport: TCP, flow control, congestion control Session capture and analysis of them. 4.-Network layer Network functions, types of services Service oriented connection (generic). Non-connection oriented service: IP. Addressing, datagrams, basic procedures and associated procedures (ARP, ICMP, DHCP, NAT ...) 5.-Link layer Link functions. Point-point links: Simplified HDLC, PPP. Multipoint links-LAN: Ethernet 6.-Network interconnection Interconnection functions. Interconnection at the physical level (repeaters, hubs), link (bridges, switches), network (routers), superior (gateway)

7.-Global vision of the course Vision of telecommunication networks and services integrating all levels of communication

TEACHING METHODS

Teaching-Learning Methodology

The course consists of Lectures (M), Seminars (S) and Labs (PL) based on which the theoretical and practical contents are articulated according to the instructions M / S / PL for each one of them.

Regarding the organization/distribution throughout the course of the different modalities of classes, since it is an annual (fall+spring semester) course, the bulk of the lecturing hours are concentrated during the first semester so that the students have all the necessary theoretical background to make the most out of the lab sessions and seminars as soon as

possible. **TYPES OF TEACHING** S GA GL GO GCL TA TL GCA Μ Types of teaching Hours of face-to-face teaching 30 31,5 21 7,5 Horas de Actividad No Presencial del Alumno/a 45 47,25 31,5 11,25 Legend: M: Lecture-based S: Seminar GA: Applied classroom-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups TA: Workshop TI: Industrial workshop GCA: Applied fieldwork groups **Evaluation methods** - Continuous evaluation - End-of-course evaluation Evaluation tools and percentages of final mark - Written test, open questions 70% - Exercises, cases or problem sets 5% - Lab sessions with computers and other communication network equipments 25% **ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT** The final grade for this course is computed as the sum of 4 aspects: A. Continuous evaluation of the seminars: 5% of the grade B. Labs: 25% of the grade C. Minimum skills assessment: 20% of the grade D. Theory/Assignment-practical exams (written): 50% of the grade In order to pass the course, the following conditions must be met (BOTH): -In section C, score a minimum of 7 points (out of 10). -In the weighted sum (A * 0.05 + B * 0.25 + C * 0.20 + D * 0.5) score 5 points (out of 10) or above. Not fulfilling any of the above two conditions will meant that the course will be graded as "Not passed". Below is a breakdown of each of the 4 parts of the grade: 5% Continuous Evaluation Performance: This part of the grade includes the evaluation of the individual and group-assignments to be solved during seminar sessions, as well as the attitude, involvement and evolution of the students during these sessions. 25% Labs Evaluation. To choose: 1) With compulsory attendance and continuous performance assesment (default): -Evaluation of weekly activities related to labs performance and written lab-reports, both at individual and team (couple) level (50%). - Individual hands-on skills assessment tests, scheduled after the end of each block of lab practices (50%). 2) Without compulsory attendance and without continuous assessment: -A single individual lab-skills assessment test to be carried out during the Spring semester. The specific date of completion of this test will be notified at the beginning of the Fall semester (100% of the labs grade). Students are requested to communicate their choice of one or another form of assessment before Labs practices have begun i.e., before the 4th academic week of the Fall semester. 20% Minimum skills assesment Mastery of basic/fundamental concepts covered in this course. 50% Written Exams December / January: written exam on Theory related aspects covered in lectures during the Fall semester (20%) May: written exam on exercises and practical questions related to contents covered in the course assignments during the Fall and Spring semester (30%) DISCLAIMERS OF FOLLOW-UP/CONTINUOUS ASSESSMENT EVALUATION: Those students who wish to avail themselves of the right to renounce the continuous (or mixed) assessment system and opt for the final evaluation, may communicate the aforementioned decision, preferably via email, to the teachers responsible for the course at any time during the first 18 academic weeks of the current academic year.

The resignation to the call will mean the qualification of "Not Presented". In the case of continuous assessment evaluation, students may waive the call by simply not signing in for the final evaluation test.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Evaluation of the Extraordinary Call

The evaluation of the extraordinary call will be made based on the results of an exam that constitutes the 100% of the final grade.

The exam will consist of 2 separate parts:

Y. Minimum skills assessment: 20% of the grade

Z. Written Exam to cover all theoretical and practical aspects treated in the course (lectures, seminars and labs): 80% of the grade

In order to pass the course, the following conditions must be met (BOTH): -In section Y, score no less than 7 points (out of 10). -Score above 5 points (out of 10) in the weighted sum (Y * 0.2 + Z * 0.8).

Among the students that either did not take the exam or did not pass the course in the ordinary call, those who scored less than 7 points (out of 10) in section C, but

achieved 5 points (out of 10) or above in the weighted sum A * 0.05 + B * 0.25 + D * 0.50 will be able to released of sitting for Part Z of the exam.

And their final grade will be computed in the extraordinary call as the weighted sum of Aord * 0.05 + Bord * 0.25 + Yextra * 0.20 + Dord * 0.50.

MANDATORY MATERIALS

-Slide bundles with material for lecture classes (available eGela).

-Self-assessment questionnaires for knowledge assimilation (available in eGela in online format and / or pdf)

-Wiki and final report on expected minimum knowledge required for each of the theoretical topics (available in eGela) -Assignents (exhibitions and resolution of exercises individually, or through different group dynamics) for seminar classes.

-Guides for the realization of labs (includes questionnaires prior to practice, script of the proposed practice for its development in the laboratory, questionnaire to be completed for the preparation of the final report of the practice based on the skills acquired during the realization Of the same).

TEACHING METHODS

Theory lessons are supported by both master classes and problem-solving classes.

At the beginning of the course, and in a class dedicated to it, the laboratory training project to be carried out during the course will be exposed, as well as the requirements to fulfill and some aspects to be taken into account in the assessment. Achieving the requirements of the project is a necessary but not a sufficient condition to overcome the laboratory part. Furthermore, it will be necessary to demonstrate, answering to questions in an individually oral exam, a sufficient skill in the characterization of the circuits performed.

Laboratory attendance is voluntary, as well as master classes attendance. In the implementation of the project, each student must provide the consumables components that are needed, which will also be of their choice. It is also recommended for them, to have basic tools to help in the hardware assembly, such as welders, scissors, etc. By extension, it is also helpful to have some basic instruments for the characterization of the circuits, such as a multimeter and the possibility to use an oscilloscope. Basic equipment for circuit characterization is available at the laboratory's opening hours: power supply, multimeter, signal generator, and oscilloscope. As a courtesy, working-stations will be set up for the recommended modifications or failure correction of the circuits, but not for their assembly itself, as this is supposed to be done outside the established practice hours. The evaluation of the work of the laboratory will be done in one of the work-stations, individually, based on the characterization of the assembled circuit, which must be operative at

the moment of the assessment, and the written report.

t,)

In the case that the health conditions do not allow the realization of a teaching activity and / or evaluation in person, it will activate a modality of non-presence of which students will be informed promtly.

OBSERVATIONS

There will be no restrictions on the use of calculating instruments in the examinations.

From the experience of past editions of this course, as well as from other equivalent courses from previous study plans, the existence of students whose laboratory skills are exceptional, but not on the theoretical part or vice versa has been observed. The current system of a single subject with a single weighting prevents these students from achieving the brilliance in their results as they deserve. It is for this reason that the teaching staff of this course will pay attention to these students and, if so, they will be able to qualify the student regardless of the general formula.

In the scope of the telematics module this course aims at combining the views fro Networks" courses in a holistic e2e manner.	les and services ting mechanism exchange amo gramming and v QoS levels and hancements wi	s required ns and int ong all the validating guarante Il be also	d. ernetworking elements routing and ee proper considered	ng in th d d in
COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT The course aims at applying the network architecture and interconnection princip				
 * Design and configure in a lab environment the addressing/routing mechanisms to application layer to support the information exchange among all the elements in chain (Competence TE2 -routing, signaling- and TE4 -description and validation of Telematics Module) * Design a infrastructure as to deliver required QoS levels and guarantee proper enhancements of networks and services via technological- and TE6 -designg of a * Empirically evaluate the obtained performance and propose posible enhancement degradation conditions (TE3 -ability to compose services by using planning and a service services by using planning and a service service service service services by using planning and a service service service service services by using planning and a service servi	in the telecomm of protocols and performance o architecture-) ents/optimizatio	nunication d interface f deploye on mecha	a service su es- from the d services	upply e (TE5
heoretical and Practical Contents				
 It is basically a lab course so most lab tasks are to be accomplished by student to 1. Introduction to the simulated company networking and services requirements/g 2. HW and SW installation and maintenance. 3. Basic services and link level. 4. Isolated company network. 5. Interconnection. 6. Network management and modeling. 7. Advanced services and enhancement. 	• ·	llowing th	is structure	e::
EACHING METHODS				
Students, organized into small groups, will have to face the design and deploymer (networking and services, as well as interconnection with other companies) of a fict cover not only exclusively technical aspects, but also consider cost rationality and It is, therefore, a methodology close to PBL (project-based learning), in which ear supervision of the teaching staff, the most appropriate projects for each company development to be carried out. As a prerequisite, it will be necessary to polish basic competences of administrat individual basis, which will be useful in the subsequent deployment of the group r professional environment, students' autonomous work will be encouraged manuals, tutorials and diverse computer resources, limiting the magisterial part of problematic that is pursued to approach in each case.	ictitious compared d suitability for e ch group will es v, and establish ion of networks models. In any e d, by means of	ny. This c each com tablish, u the limits and serv case, tryin the consu	lesign shou pany's cas nder the of the ers on an ng to mimic ultation of fo	uld suistry c a orum

TEACHING METHODS

Methodology of teaching based on laboratory work, which consists of designing and constructing, through a series of guided practices, electronic subsystems for the implementation of basic functions in telecommunications.

The student must design, assemble, measure, improve the designs until they meet the required starting specifications, and finally characterize the built circuits.

The subject will be managed through a virtual platform that will allow the immediate sharing of messages and information, access to documentation and electronic specification sheets, consultations, discussion groups, etc.

The non-presence part will be dedicated to the search of information, reading of documentation, specification sheets and application notes, and the preparation of designs and even electronic assembly of prototypes, as well as electronic simulation of subsystems which may be relevant. It will also be dedicated to the completion of the final reports of the practices carried out.

To prepare the laboratory practices there will be brief lectures and a previous job of searching information on the web. In laboratory practices, the proposed electronic systems should be designed, simulated and physically realized. Finally, the electronic system should be characterized with a report.

In the event that the sanitary conditions prevent the realization of a teaching activity and / or face-to-face evaluation, a on-line modality will be activated of which the students will be informed promptly.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching				40	5				
Horas de Actividad No Presencial del Alumno/a				60	7,5				

Legend: M: Lecture-based

TA: Workshop

S: Seminar TI: Industrial workshop

GA: Applied classroom-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Oral defence 20%
- Exercises, cases or problem sets 40%
- Teamwork assignments (problem solving, Project design) 40%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The scores will be based on the evaluation of the work performed in class, the prototypes to be designed and assembled, and the final report of the prototype assemble and, which should include the design process and the characterization of the implemented circuits.

Evaluation instruments:

- Attendance control sheet through ICTs and presence.
- Written report of the theoretical realization by means of simulation of the proposed practices.
- Resolution in the laboratory of the proposed practices.
- Written report of laboratory practices.

The resignation procedure is the one included in the corresponding regulations. The evaluation of those students that accept the resignation is done by a test for the 100% of the subject.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation in second call consists of a test, for the 100% of the subject, to be carried out in the laboratory.

MANDATORY MATERIALS

Orcad, PSpice, LTspice, Agilent ADS or equivalent CAD/CAE tool.

Laboratories

Universidad Euskal Herriko del Pais Vasco Unibertsitatea

Practice 1 Analog Modulations. AM. Practice 2 Analog modulations. FM. Practice 3 Digital modulations

TEACHING METHODS

PRESENTIAL TEACHING:

- Classroom lectures: *exposition of fundamentals and theory *problem resolution.

It will be necessary for the students to perform the required personal work (non-contact teaching) to follow the classes.

- Laboratory practices: simulation of analog and digital communication systems in the Matlab / Octave environment and analysis of digital communication systems using real equipment.

- Seminars: explanation of analog modulations and resolution of complex problems.

NON-PRESENTIAL TEACHING:

- Classroom lectures:

- * Study of the theory proposed for the week. Preparation of lists of questions for discussion in the classes face-to-face
- * Resolution of proposed problems and preparation of exercises.
- Laboratory practices: preparation of the proposed practices and relate results to the theory.

- Seminars: preparation of the proposed problems.

It will be necessary for the students to perform the required personal work (non-contact teaching) to follow the classes with use.

- Laboratory practices: simulation of analog communication systems in the Matlab / Octave environment and analysis of digital communication systems using real equipment.

- Seminars: resolution of complex problems.

If the health conditions do not allow a presential teaching and evaluation, a non-presential mode will be activated and the students will be informed from time to time.

GA: Applied classroom-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 53%

- CUESTIONARIOS EGELA 47%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Two assessment systems are considered in ordinary call: on the one hand, the continuous evaluation system, which requires regular attendance at the classes and a regular follow-up of the subject, surpassing the partial exams that are carried out; on the other hand, the final evaluation system, basically consisting of a single final exam of the subject. Both systems are exclusive, so the student must expressly waive the continuous evaluation to be able to take the final evaluation test.

A) CONTINUOUS EVALUATION SYSTEM

A continuous evaluation will be carried out throughout the course through three individual partial evaluation tests (PEP). In each of the PEP they will evaluate the competences acquired in solving problems (lectures, classroom practices and seminars) and in laboratories (laboratory classes):

- PEP1:

* Lessons 1 and 2 (PEP1-M)

- *Laboratory Practice 1 (PEP1-L) - PEP2:
- * Lessons 3 and 4 (PEP2-M)
- * Laboratory practice 2 (PEP2-L)
- PEP3:
- * Lessons 5, 6 and 7 (PEP3-M)
- * Laboratory Practice 3 (PEP3-L)

CALCULATION OF THE FINAL NOTE

The final grade of the subject will be calculated with the following formula:

NF= 0,75*(N(PEP1-M)*0,3+ N(PEP2-M)*0,3+ N(PEP3-M)*0,4)+ 0,25*(N(PEP1-L)*0,25+ N(PEP2-L)*0,35+ N(PEP3-L)*0,40)+

To pass the subject it will be necessary to fulfill the following conditions:

- Obtain an NF equal to or greater than 5 points out of 10 (5/10).

- Having obtained an average score in the part of Classroom (M) higher than 3 points out of 10 and an average score in the part of Laboratories higher than 3 points out of 10. That is to say:

* N(PEP1-M)*0,3+ N(PEP2-M)*0,3+ N(PEP3-M)*0,4 must be equal or greater than 3 out of 10

* N(PEP1-L)*0,25+ N(PEP2-L)*0,35+ N(PEP3-L)*0,40 must be equal or greater than 3 out of 10

- Have a minimum attendance of 75% to face-to-face classes of laboratory.

In case you have not obtained a minimum of 3 points out of 10 in any of the sections and the final grade obtained through the formula was greater than 4.5 the final grade that will be reflected in the minutes will be 4.5 / 10.

ASSISTANCE TO THE PRESENTIAL TEACHING

To be able to follow the continuous evaluation system, a minimum attendance of 75% is required for face-to-face classes classes of laboratory.

This criterion will be applied throughout the course, so that in order to be evaluated in the partial evaluation tests (PEPs), this requirement must be met on the date of completion of each test.

The rejection of the continuous evaluation must be made through written communication to the teacher of the subject until April 30. The rejection of the continuous evaluation supposes the loss of the results of the evaluations previously carried out. The rejection of the continuous evaluation can be done separately for the laboratories, on the one hand, and for the set of classroom lectures -seminars, on the other.

B) FINAL EVALUATION SYSTEM

It will consist in the realization of an exam on the day of the ordinary call. The exam will have two parts, one test consisting of problem solving of the subject and a test of laboratory practices.

The Final Note will be calculated by applying the following formula:

NF = 0.75 * N (M + PA) + 0.25 * N (Lab)

It will be necessary to obtain a minimum score of 3 out of 10 in each of the sections. That is to say:

- N (M + PA) must be equal to or greater than 3 points out of 10

- N (Lab) must be equal to or greater than 3 points out of 10

In case you have not obtained a minimum of 3 points out of 10 in any of the sections and the final grade obtained by the formula was higher than 4.5 the final grade that will be reflected in the minutes will be 4.5 / 10.

If you do not assist to the exam in the ordinary call, the rejection of it will be assumed in any case.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation in the extraordinary call will be made with respect to the same contents taught during the course (classroom lessons (M+PA), Laboratory practices (Lab) and Seminars).

It will consist of an examination on the day of the extraordinary call. The exam will have two parts, one test consisting of problem solving on the subject and a test of laboratory practices.

The Final Note will be calculated by applying the following formula:

NF = 0.75 * N (M + PA) + 0.25 * N (Lab)

It will be necessary to obtain a minimum score of 5 out of 10. Additionally, it will be necessary to obtain a minimum score of 3 out of 10 (3/10) in each of the sections. That is to say:

- N (M + PA) must be equal to or greater than 3 points out of 10 (3/10)

- N (Lab) must be equal to or greater than 3 points out of 10 (3/10)

In case you have not obtained a minimum of 3 points out of 10 in any of the sections and the final grade obtained by the formula was higher than 4.5 the final grade that will be reflected in the minutes will be 4.5 / 10.

If a grade equal to or greater than 5/10 has been obtained in the ordinary call at the Classroom lectures modalities (M+PA)

, it will be possible to keep this note for the extraordinary call. The same applies to the Laboratory Practices modality. No grade obtained during the course in the different sections is maintained for later courses.

OBSERVATIONS

Faculty 345 - Faculty of Engineering - Bilbao		Cycle	٦.
Degree GTELEC30 - Bachelor's Degree in Telecon	mmunications Engineering	Year	Fourth year
COURSE			
27373 - Optic Communications		Cred	lits, ECTS: 4,5
COURSE DESCRIPTION			. , .
Optical communications is an elective subject given on Engineering in Bilbao, and it is linked to the module Te	•	the 4th year in the	Faculty of
The subject is devoted to the fiber-optic communication taking on a more important role in the field of telecomm analyze, evaluate and design the elements, devices, sy	nunications engineering. There	efore, this is a key	subject to learn,
The subject will not be difficult to follow provided that the statistics (subjects 'Calculus I', 'Algebra' and 'Statistics' in solving problems related to the propagation of electro and in handling circuits, components and subsystems of of the 3rd year).	of the 1st year). Likewise, it i omagnetic fields (subject 'Ele	s required a workin ctromagnetic Fields	g knowledge both s' of the 2nd year)
COMPETENCIES/LEARNING RESULTS FOR THE SUB	JECT		
Competencies are the correct combination of knowledge to perform correctly a job. The specific competencies a Systems, whereas the general and transversal competencies Telecommunications Engineering (Grado en Ingeniería	re acquired and developed in encies are developed during t	the module Teleco the whole degree o	ommunication
Students of this subject will acquire the following comp	etencies:		
 Specific competencies: Ability to select circuits, subsystems and systems for radiodetermination (M03S4). Ability to select antennas, pieces of equipment and sy propagation by electromagnetic, radio-frequency relate spectrum and frequency assignment (M03S5). 	stems for transmission and g	uided and non-guid	ded wave
General and transversal competencies: - Knowledge of the fundamental topics and technologies and to adapt themselves to any new situation (G003). - Ability to solve problems with initiative, decision making and abilities, understanding the ethical and professional Telecommunications Engineering (G004).	ng, creativity, and to commun	icate and transfer k	nowledge, skills
Theoretical and Practical Contents			
The subject is divided into two sections: - On one hand, in the lectures + practical classroom we and in groups of three or four, and they consist of 5 les - On the other, in the practical laboratory work, student practical tasks. Previously, one training lesson is given	sons. s work in groups of three or fo	our, and they have	to complete 8
Lectures + practical classroom work + seminars: - Lesson 1: Introduction to optical fibers. Critical angle and evanescent field. Optical fiber: struct and transmission capacity. Historical view. - Lesson 2: Propagation in optical fibers.	ure, types, applications, refrac	ctive index profiles,	numerical apertu
 Attenuation: intrinsic and extrinsic mechanisms, transme Dispersion: concept and effects, types of dispersion an structure and types of cables. Connectors and splices: Lesson 3: Optical emitters. LEDs: working principle, SLEDs, ELEDs and efficiencies 	d maximum distance limited b intrinsic and extrinsic losses,	by dispersion. Cabl connector and spli	es and fibers: ce losses.
 LEDs: working principle, SLEDs, ELEDs and efficiencie emission modes and lasers based on distributed mirror Lesson 4: Optical detectors and network design. Photodiodes: working principle, efficiencies and respon 	s. External modulators.	-	

Photodiodes: working principle, efficiencies and responsivity, spectral features and avalanche photodiodes vs PIN photodiodes. Design of an optical link taking into account the times of response of the laser, of the optical fiber and of the receiver.

NAZIOARTEKO BIKAINTASUN CAMPUSA CAMPUS DE EXCELENCIA INTERNACIONAL

Universidad del País Vasco - Lesson 5: Optical amplifiers and non-linear effects.

Optical amplifiers: working principle, EDFA, SOA and Raman. Non-linear effects: classification and description.

Practical laboratory work:

- Training lesson for practical laboratory work: Introduction and safety. Metrology. Study of uncertainties.

- Practical task 1: Measurement of passive devices in monomode fibers.

Measurement of bending losses. Couplers.

- Practical task 2: Measurement of the numerical aperture and other parameters of interest in multimode fibers.

Misalignment losses in fibers. Attenuation in optical fibers with connectors using different LEDs.

- Practical task 3: Measurement of active devices and WDM transmission systems.

Measurement of a semiconductor laser. Power-current curve. Transmission with wavelength division multiplexing. Measurement of the attenuation in demux filters.

- Practical task 4: Measurement of monomode fiber communications links.

Learning to use an optical time-domain reflectometer (OTDR). Measurement of the attenuation and insertion losses in fiber links.

- Practical task 5: Investigation of the dispersion and the attenuation in multimode fiber optical links.

Measurement of the dispersion and the attenuation as a function of the link length.

- Practical task 6: Investigation of the eye diagram and the bit error rate in multimode fiber optical links.

Investigation of the quality factor and bit error rate as a function of the link length.

- Practical task 7: Simulation of digital transmission systems.

Simulation of digital transmission systems in medium-range distances using monomode fibers.

- Practical task 8: Design and optimization of a digital transmission optical network.

Design and optimization of a digital transmission optical network using monomode fibers.

TEACHING METHODS

Students of this subject work individually or in groups. The methodology is explained in more detail below:

- Cooperative masterclasses (lectures):

The theoretical basics and concepts are explained by the lecturer. In order to encourage students to participate, theoretical lectures are alternated with mathematical tasks performed in groups of three or four students. Furthermore, the lecturer assists students with the study and the reading of recommended bibliography in the hours of student work outside the classroom.

- Problem-solving activities (practical classroom work):

Problem-solving activities are carried out by the lecturer on the blackboard; these problems are related to the theory explained in the lectures (they are marked with an asterisk). Students are also encouraged to participate and discuss in class, involving question-answer type interactions, as well as problem-solving activities of a certain subsection on the blackboard by one student chosen by drawing. In such an interaction, mistakes in problem-solving activities can be as valuable as correct answers, since they make it possible to identify items that were not clear enough and correct common mistakes.

- Problem-solving task-based learning (seminars):

Students solve the remaining problems (i.e. not marked with an asterisk) in groups of three or four. Students are encouraged to prepare them beforehand (in the hours of student work outside the classroom). In addition, upon completion of each lesson, a group must give a brief presentation (of aproximately 15 minutes) about more specific aspects related to that lesson by using the material provided by the teacher. Such activities will allow the teacher to track the learning results of students.

- Practical task-based learning (practical laboratory work):

Students perform experimental measurements and simulations in groups of three or four (there are 8 practical tasks). Previously, students can read the manuals thoroughly and prepare each practical task in the hours of student work outside the classroom. Afterwards, in the practical laboratory work, each group performs the experimental measurements or the simulations, and the results are recorded, processed and documented in a report. The lecturer assists each group both with their measuring and with the development of the report in order to improve successive practical tasks and reports. Assistance from lecturer takes place in the hours of face-to-face teaching of the subject, as well as in office hours.

Note: should the health conditions prevent any face-to-face teaching and/or assessment, such activity will move online, and students will be kept informed in a timely manner.

Students who achieved at least a 50% pass mark in the assessment of the lectures + practical classroom work + seminars

Universidad Euskal Herriko del Pais Vasco Unibertsitatea or in the assessment of the practical laboratory work of a previous call: it is possible to keep the mark of the corresponding assessment.

Withdrawal from a call:

- Non-attendance at the exam call in the official examination date of the final assessment test will result in a withdrawal (NOT PRESENTED will be applied).

MANDATORY MATERIALS

Lecture materials and notes are available in the eGela virtual platform:

- PowerPoint slides used in the lectures.
- Questions from the exercises worked on in the practical classroom work and in the seminars.
- Manuals and reports of the practical laboratory work.

Information about the use of materials, media and resources:

- During teaching activities (continuous assessment):

* Students are permitted to use books or course notes as well as electronic or computer systems or devices. Should these systems or devices have access to the Internet, any search for other than instructional materials will be prohibited. In any case, no telephone systems, devices or any other type of help are permitted.

- In the final assessment test (both continuous assessment and final assessment):

* Students are only permitted to use calculators. Neither books or course notes nor telephone, electronic or computer systems or devices nor any other type of help are permitted.

OBSERVATIONS

- Students will be subjected to the 'Academic ethics policy and prevention of dishonest and fraudulent activities of the University of the Basque Country (UPV/EHU)'.

- Attendance of the lectures + practical classroom work + seminars is optional. Nevertheless, students who do not attend and do not show any doctor's note will have to get up to date with the lecture material.

- Attendance of the practical laboratory is compulsory for students accepting the conditions of continuous assessment of this type of teaching. Students who do not attend and do not show any doctor's note will receive no marks in the corresponding report.

Faculty345 - Faculty of Engineering - BilbaoDegreeGTELEC30 - Bachelor's Degree in Telecommunications Engineering	Cycle .
	Year
OURSE	i cai
27374 - Access Networks	Credits, ECTS: 6
OURSE DESCRIPTION	
The ``Access Networks`` course is one of the subjects of the Telematics specialization in Engineering in Telecommunication Technology. It belongs to the area of ``Networks`` of the ``Transport Networks`` and ``Mobile Service Networks`` within this branch.	
This subject presents and explains the main characteristics of the access network, which connects the end user of the service to the first node in the network that supports this service. Mobile Networks and Services and Transport Networks make up a set to have a complete Mobile Networks and Services deals with aspects of access networks that include mobility the study of communications networks to describe the functioning of the different service is techniques that allow the services to be provided. The subject is divided into two main parts. In the first part, the features and technologies of are those available to the general public, are presented. In the second part, Corporate Ac	vice. This course, together with e vision of the current networks y. Transport Networks complete nodes, their interconnection an of Public Access Networks, whi
These help provide access to a particular closed group of users. The architecture and ope are very different and that is the reason for this division.	
For the study of Public Access Networks technologies, they will be classified and describe medium used: wired (ADSL, HFC, FFTX) or wireless (WiMAX). In the case of Corpora technologies, different technologies are analyzed and some complex scenarios are also in segmentation of a LAN, remote access to a private network and loop resolution in LANs.	ate Access Networks
One of the main aims of this subject is that the student should develop the ability to mana and mandatory standards as well as analyze and evaluate the social and environmental in meet these goals, legislation or the main regulations related to the access network infrast cabling systems) necessary for the design and installation of these networks in a timely m	mpact of technical solutions. To ructure (CTI and structured
Prerequisite to take this course is, at least, having acquired the basic concepts related to introduced in the Telecommunication Networks and Services Architecture course, which is the second year of the degree.	
OMPETENCIES/LEARNING RESULTS FOR THE SUBJECT	
This subject contributes to the following telematics competency related to the design and	deployment of networks:
Ability to apply the fundamental techniques of networks, services and data communication switching and management systems, routing, security (cryptographic protocols, tunnelling authentication and content protection), traffic engineering (graph theory, queuing theory a reliability and quality of service, either in fixed, mobile, personal, local or long distance environmentation bandwidths, including telephony and data.	g, firewall, charging mechanism and teletraffic) charging and
heoretical and Practical Contents	
THEORETICAL CONTENT	
1 Introduction 2 Public Network Access Technologies 3 Corporate Network Access Technologies	
PRACTICAL CONTENT	
Seminar 1: Getting knowledge about my access network Seminar 2: QoS and network neutrality	
Practice 1: Access network performance Practice 2: Structured cabling and CTIs Practice 3: VLAN	

As regards the methodology, the course is divided into two parts: 1) the theoretical knowledge is taught in lectures and in

Universidad Euskal Herriko del País Vasco Unibertistatea

classroom practice (30 hours) and 2) the subject has a practical component based on laboratory practice (27 hours) and two seminars (3 hours).

In lectures, the teacher's explanation will be supported by material that will be available in eGela. Debate with students will be encouraged, together with activities that may help the understanding of the topics discussed in the context of the classroom.

In laboratory practical work, both autonomous (based on individual questionnaires) and group work will be required. The practices and reports will be developed in pairs and groups.

Finally, in seminars debate and oral presentation of current issues related to access networks will be encouraged.

In the event that sanitary conditions prevent the face-to-face teaching activity and / or assessment, online modalities will be made active and the students will be promtly informed.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	ТА	TI	GCA
Hours of face-to-face teaching	22,5	3	7,5	27					
Horas de Actividad No Presencial del Alumno/a	33,75	4,5	11,25	40,5					
Legend: M: Lecture-based	S: Seminar					GA: A	pplied cl	assroom	i-based o

M: Lecture-based GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups TA: Workshop

TI: Industrial workshop

GA: Applied classroom-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 50%
- Exercises, cases or problem sets 25%
- Individual assignments 5%
- Teamwork assignments (problem solving, Project design) 15%
- Oral presentation of assigned tasks, Reading; 5%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

- In the ordinary evaluation modality, the mark will be the sum of 2 parts:
- A. Final exam: 50% of the mark
- B. Continuous Evaluation: 50% of the mark, of which
 - 25% related to practical work
 - 5% handing in of individual questionnaires
 - 15% attitude and progress shown in class (all kinds of class)
 - 5% presentation of work done (seminars)

In order to pass the course, the students must fulfil ALL the following conditions:

- To have attended all the compulsory attendance classes (laboratory classes and seminars).

- To pass both parts of the subject, A and B. In that case, the final grade will be the sum of the two parts. In case of failure to pass any of the two parts, the final grade will be that of the failed part.

If a student wants to opt out of continuous evaluation or of ordinary evaluation, he/she must proceed according to the procedure and deadlines established in the Student Evaluation Rules, in articles 8 and 12 respectively.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary exam call, the note will be the result of a final exam that will comprise the 100% of the subject.

To decline to sit in the extraordinary call of the course, it will be enough not to attend the final written test of the extraordinary call.

concepts as s	d, operate and manage telecom networks, services, processes and applications, c systems for acquisition, transportation, representation, processing, storage, manag formation, from the point of view of telematics services.			

Ability to apply learnt techniques in networks, services and telematics applications, such as management systems, signaling and switching, routing, security (cryptographic protocols, tunneling, firewall, billing mechanisms, content authentication and protection strategies), traffic engineering (graph theory, queuing theory and teletraffic) billing, reliability and quality of service, both in fixed, mobile, personal, local or long distance environments and with different bandwidths, including telephony and data.

TRANSVERSE COMPETENCY

Communicate and transmit knowledge, skills and abilities. Communicate in writing knowledge, procedures, results and ideas related to telecommunications and electronics, in a multilingual environment.

Theoretical and Practical Contents

0. INTRODUCTION

- 0.1. Introduction to this subject
- 0.2. Introduction to main concepts related to transport networks: routing, transmission, switching and signalling.

1. ROUTING

- 1.1. What is routing? What is it for? Context and operation. Types of routing strategies.
- 1.2 Routing in data networks
- 1.2.1 Static routing (ARP-IP, RIBs and FIBs)
- 1.2.2 Dynamic routing: RIP, OSPF, BGP
- [Some of the routing concepts are studied and worked by means of laboratory sessions]

2. TRANSMISSION 2.1 Introduction 2.1.1 Introduction to transmission networks 2.1.2 Contextualization, evolution and operation 2.2 Technologies in transmission networks 2.2.1 Introduction to optical transport networks 2.2.2 Digital Multiplexing Hierarchies TDM 2.2.2.1 PDH (just introduction: obsolete in RT) 2.2.2.2 SDH / SONET 2.2.3 Optical Multiplexing Hierarchies (emergent networks) 2.2.3.1 OTN / WDM 2.2.3.2 MPLS-TP 2.3 Convergence of networks and services: NGN 3. SWITCHING 3.1 Switching 3.1.1 Introduction 3.1.2 Types of switching: circuit, packet, connectionless and connection oriented 3.2 Circuit Switches 3.2.1 Spatial / Temporal / Two-dimensional switching 3.2.2 Single-stage / multi-stage switches 3.3 Packet Switches 3.3.1 Elements: input interface, output interface, switching framework, processor. 3.3.2 Queue management, sending planning, discard criteria 3.3.3 Switching frameworks in routers: 3 generations 3.3.4 Evolution of connection-oriented networks: X.25, FR, ATM 3.4 Integrated Switching 3.4.1 Hybrid Switching 3.4.2 Based on circuit switching 3.4.3 Based on packet switching 4. SIGNALLING 4.1 Signalling 4.1.1 What is it? Functions (in circuits and packets based networks) 4.1.2 Classification (in circuits and packets based networks) 4.2 SS7 Signalling 4.2.1 SS7 Signaling 4.2.1.1 Common channel network signaling 4.2.1.2. Architecture of SS7 signaling network 4.2.1.3 SS7 protocols 4.2.2 ISUP 4.2.2.1 Supported services by ISUP. ISUP vs ISDN 4.2.2.2 ISUP Messages Formats 4.2.2.3 Call control procedures and messages 4.2.3 MTP 4.2.3.1 MTP3

4.2.3.2 MTP2

4.2.3.3 MTP1

TEACHING METHODS

The subject consists of lectures (M), Seminars (S), and Laboratory Sessions (PL).

It will be necessary to deliver a practice report for every practical exercise proposed by the teacher. The exercises in the lab and their corresponding reports can be made in pairs. Students must submit reports one week after the final session of every exercise.

In the event that the sanitary conditions prevent the realization of any teaching activity and/or face-to-face evaluation, a non-face-to-face modality will be activated of which the students will be informed promptly.

Evaluation methods

Universidad Euskal Herriko del Pais Vasco Unibertsitatea

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 80% - Exercises, cases or problem sets 20% **ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT** The subject is evaluated following the ongoing assessment ("evaluación continua") typology that is composed of two parts: a theoretical part (composed of a mid-term exam and a final exam) and a laboratory part. Final mark: - 80% of the mark from the theoretical part plus 20% from the mark of the laboratory part - Minimum: 4 points out of 10 in each part. 1) The mark of the theoretical part (written exam corresponding to master and practical classes) is calculated as follows: - Mid-term exam: 50% of the mark. Chapter 1, 2 and 3. - Final exam: 2 parts, each one is 50% of the mark • 1st part. Chapters 4, 5, 6 and 7 • 2nd part. Chapters 1, 2 and 3. If the student does this exam, the new mark will replace the mark of the mid-term exam. 2) The mark of the laboratory part corresponds to the deliverables presented by the student. Attending to the laboratory is mandatory to be evaluated following the "evaluacion continua" system. The students refusing the ongoing assessment system, following the procedure and the deadlines stated in Normativa de Evaluación del Alumnado, will have a final evaluation in the form of a written exam consisting of a part corresponding to lectures (80%) and a part corresponding to the laboratory (20%). Waiving the ordinary call: students not sitting for the final exam will be considered as students waiving the ordinary call. When the condition of "Minimum of 4 points out of 10 in each of the two parts (theory and laboratory)" is not met, and the value of Final_Note calculated according to the next formula Nota_final=0,8*nota_teoría+0,2*nota_laboratorio is greater than 4, the final mark will be 4. In all other cases, the final mark will be the result of applying the formula. **EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT** Written exam consisting of a part corresponding to lectures (80%) and a part corresponding to the laboratory (20%), requiring a minimum of 4 points out of 10 in each of the two parts. If a student request to maintain the mark of the laboratory part from the ongoing assessment, the student will have only a written exam corresponding to lectures. The final mark will be calculated from the laboratory part (20%) and from the written exam (80%). When the condition of "Minimum of 4 points out of 10 in each of the two parts (theory and laboratory)" is not met, and the value of Final_Note calculated according to the next formula Nota_final=0,8*nota_teoría+0,2*nota_laboratorio is greater than 4, the final mark will be 4. In all other cases, the final mark will be the result of applying the formula MANDATORY MATERIALS - Lecture slides - Practical cases and problems - Guides for laboratory

Degree GTELEC30 - Bachelor's Degree in Telecommunications Engineering	Year Fourth year
COURSE	
27377 - Mobile Networks and Services	Credits, ECTS: 4,5

COURSE DESCRIPTION

In this course the particularities of the wireless mobile environment regarding the provision of telecommunications services are identified and the necessary adjustments at different levels compared to the non-mobile environment are analysed. Different technological solutions to provide mobility are studied and compared, analysing the specific problems solved by each of them, their application environment, network architecture, protocols, types of services they can offer... The course seeks a specialization in the telematics aspects of mobile networks and services, fostering the acquisition of the skills to apply the techniques required by both telephony and data networks to the ever-growing mobile environments. The course is based on the general networking concepts presented in the course "Architecture of Telecommunication Networks and Services" which are particularized in this course for mobile networks. In addition, "Mobile Networks and Services" forms a block with two other courses: "Access Networks" and "Transport Networks". In the first one, the different technologies that allow the users to access the data networks are covered. Wireless and mobile networks are a subset of these technologies that in "Mobile Networks and Services" is studied in depth. In the second backhaul and interconnection networks are analysed.

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT

BASIC COMPETENCIES

. Students have demonstrated knowledge and understanding in a field of study that has its foundations on the general secondary education, and it is typically at a level which, although it is based on advanced textbooks, includes some aspects that involve knowledge of the forefront of their field of study.

. Students can apply their knowledge to their work or vocation in a professional manner and have skills typically demonstrated through devising and defending arguments and solving problems within their field of study.

. Students have the ability to gather and analyse relevant data (usually within their field of study) to make judgments that include reflection on relevant social, scientific or ethical aspects.

. Students can communicate information, ideas, problems and solutions to both specialised and non-specialised audiences.

. Students have developed those skills needed to undertake further studies with a high degree of autonomy.

COMPETENCIES OF THE GRADE

. Knowledge of basic subjects and technologies that enable the student to learn new methods and technologies and that will give him or her the versatility to adapt to new situations.

. Ability to solve problems with initiative, decision making, creativity, and to communicate and transmit knowledge and skills, understanding the ethical and professional responsibility of the activity of a Technical Telecommunications Engineer. Ability to work in a multidisciplinary group and in a multilingual environment and communicate, both in writing and orally,

knowledge, procedures, results and ideas related to telecommunications and electronics.

SPECIALTY COMPETENCIES OF THE TELEMATICS MODULE

. Ability to apply the fundamental techniques of the networks, services and data communication applications, such as management systems, signaling and switching, routing, security (cryptographic protocols, tunneling, firewall, tarification mechanisms, authentication and contents protection), traffic engineering (graph theory, queuing theory and teletraffic) pricing and reliability and quality of service, either in fixed, mobile, personal, local or long distance environments with different bandwidths, including telephony and data.

LEARNING RESULTS.

. The students will be able to describe the problems and the particular needs that arise in the provision of telecommunication services due to the wireless mobile environment, and will also be able to analyse comprehensively and compare alternative solutions to address these problems.

. The students will be able to search and analyse information on a mobile technology, working in a team. They will be able to analyse and understand in depth and, in most cases, experimentally test this technology as a prerequisite to achieve the following learning outcomes.

. The students will be able to prepare an oral presentation on the technology that has been analysed, present it to the class and satisfactorily answer questions about it.

. The students will be able to discuss the characteristics, advantages and disadvantages of mobile technologies, and compare them reasonably.

Theoretical and Practical Contents

1. Mobile networks and services: Introduction and context.

- 2. Technological requirements of the mobile environment.
- 3. Mobile network technologies.

TEACHING METHODS

Regarding the teaching methodology, the course is divided into two parts. In the first 6 weeks of the course lectures are used to present the first two units. In the second part of the course (9 weeks) the class is organised in work groups to analyse different mobile technologies and present them to the class. Seminar classes and classroom practices are used in this stage to accomplish these tasks.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	ТА	TI	GCA
Hours of face-to-face teaching	17,5	15	12,5						
Horas de Actividad No Presencial del Alumno/a	26,25	22,5	18,75						

S: Seminar

Legend: M: Lecture-based GL: Applied laboratory-based groups GO: Applied computer-based groups

TA: Workshop

TI: Industrial workshop

GCL: Applied clinical-based groups GCA: Applied fieldwork groups

GA: Applied classroom-based groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 60%
- Teamwork assignments (problem solving, Project design) 30%
- Oral presentation of assigned tasks, Reading; 10%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

- In the ordinary exam call, the mark will be the sum of 3 parts:
- A. Partial examination: 10% of the mark
- B. Analysis of technologies: 40% of the mark
- C. Final examination: 50% of the mark

In order to pass the course, the students must meet the following conditions (all of them):

- Have participated actively in one of the working groups on technology.

- In the weighted sum (A + B * 0.1 * 0.4 * 0.5 + C), get at least 5 points (out of 10).

- In the weighted sum (A + C * 0.1 * 0.5), obtain at least 4 points (out of 10).

To decline to sit in the ordinary call of the course will be enough not to attend the final written test of the ordinary call.

If a student wants to decline the ongoing assessment, he/she must proceed according to the procedure and deadlines established in the Article 8.3 of the Student Assessment Rules of the UPV/EHU.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary exam call, the qualification will be determined by a final written test that will comprise the 100% of the subject.

To decline to sit in this call it will be enough not to attend the final written examination.

MANDATORY MATERIALS

Documentation available in the virtual classroom of the course in eGela.

Evaluation methods

- Oral presentation of assigned tasks, Reading; 5%

GL: Applied laboratory-based groups

- COMPUTER PROGRAM EXAM 70%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A continuous assessment system is followed consisting of:

* Examinations during the course (30%): attendance at lectures will be monitored by tests carried out in class, according to teaching needs. Computer practical work will be evaluated by public presentation and discussion in class, and by participation in computer and classroom practical work. If the oral presentation is not made or if attendance at any of the lecture tests, computer or classroom practical work sessions is below 80%, then the total mark for the examinations during

22,5

TI: Industrial workshop

GO: Applied computer-based groups

S: Seminar

33,75

GA: Applied classroom-based groups

GCL: Applied clinical-based groups

GCA: Applied fieldwork groups

the course will be 0. Not preparing practical computer work in advance will count as an attendance fault. * Final examination on the official exam date (70%): this will consist of the development of a computer program.

In order to pass it is necessary to achieve at least 4.0 in the final examination and an average 5.0 in this and the rest of the examinations.

In order to withdraw from this ordinary call it is sufficient not to attend the final exam.

In order to renounce to the continuous assessment Article 8 of the Regulations on Assessment of Students is applicable. In this case, the assessment will be carried out following the same system as the one followed in the extraordinary call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The assessment consists of a final exam constituting 100% of the grade. This exam contains a written part and another practical one carried out in the computer. Both parts must be passed in order to pass the subject.

Those students with a grade of at least 6.0 over 10 in the lecture tests (continuous assessment) under the ordinary call can keep that grade for the written part of the extraordinary call in the same academic year.

MANDATORY MATERIALS

This subject makes use of a virtual classroom in the e-Gela platform where the student can access the following compulsory material for each type of class:

* Lectures: outlines to help in following the lectures that must be filled in by the student.

* Practical work: protocols for the different computer work, which must be read in advance to help with the preparation of sessions.

PRIVATE STUDY (90h):

Magisterial classes: home assignments should be done every week, and some effort is also dedicated to the preparation

Universidad Euskal Herriko del País Vasco Unibertistatea for individual basic knowledge exams of basic knowledge (CB).

Classroom practices: students have to do 15 problems per topic individually. Questions that arise are solved in the seminars.

Laboratory classes: a deliverable short task (pre-lab) per session has to be done, and some effort is also dedicated to the preparation for questionnaires and for the final exam.

Seminars: there are individual assessments that should be prepared.

If the case of being under inadequate health conditions for a normal development of the classes and the exams, it would be necessary to proceed with online education, about which all students would be informed in a timely manner.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	15	12	15	18					
Horas de Actividad No Presencial del Alumno/a	22,5	18	22,5	27					

Legend: M: Lecture-based S: Seminar

TI: Industrial workshop

GA: Applied classroom-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 75%

TA: Workshop

- Exercises, cases or problem sets 25%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation system is divided into two distinct groups:

1.- Written test of the MAG/PA, consisting of two parts:

1a: Partial exam on subjects 1 and 2: 40% (30% of the final grade of the subject). Those who pass this test ("5") will not have to perform this part in the ordinary final examination. All others shall do this part in the regular final exam (1.b). 1.b: Final examination under ordinary call. It consists of two parts:

i. Part of subjects 1 and 2: 40% (30% of the final grade of the subject). This paragraph should only be made by those who cannot overcome it in the partial examination of paragraph 1°a. However, persons who have passed that partial examination are authorised to perform that part, in which case they renounce the note of that examination. ii. Part of subjects 3 and 4: 60% (45% of the final grade of the subject). A minimum rating (>=3.5) should be exceeded in this part to allow weighting together with the rating obtained in the previous paragraph (paragraph 1.a or 1.b.i). 2.- Section on PL. This section provides a continuous evaluation of the tasks related to practices (25% of the final grade of the subject).

IMPOSSIBILITY OF CONTINUOUS EVALUATION:

Students who give up the continuous evaluation will be able to check the learning results of the subject by performing a final examination on the day of the ordinary call. Without continuous evaluation, two final tests will be carried out, one for laboratory and another for theory, and a weighted note must be obtained between both –5– to pass it, besides meeting the minimum grade 3.5 in Themes 3 and 4.

If a student does not attend the final examination, he or she shall be deemed to waive that call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

This special call shall consist of two tests:

- 1.- Written test for the assessment of magistral modalities and classroom practices, 75% of the final note.
- 2.- Test (using a computer) for the evaluation of the laboratory practices: 25% of the final note. Those students wishing to use the grade obtained in the continuous laboratory evaluation may waive this test.

MANDATORY MATERIALS

In eGela (http://egela.ehu.eus/), students will be provided with the following learning materials, which are necessary for the subject:

- 1 Overhead transparencies with the theoretical contents of the subject, topics T1-T4.
- 2 A collection of 10 problems to be solved in the classroom practices (PA) and 15 more problems aimed for offsite private work, topics T1-T4.
 - 3 A collection of 15 problems per topic on basic concepts, topics T1-T4.
 - 4 OrCAD/PSPICE user manual and installation guide.

-LR03: Certifies the performance and operation of radiant systems using simulation software and measurement instruments; correctly processes and analyzes the data obtained.

-LR04: Knows and applies the concepts related to radioelectric propagation mechanisms as well as deterministic and

NAZIOARTEKO BIKAINTASUN CAMPUSA CAMPUS DE EXCELENCIA INTERNACIONA

rsidad use tildad use vasco Unibertsitatea empirical prediction algorithms, in different deployment environments of radiocommunication systems, both outdoor and indoor, to evaluate the availability of associated services, in their phase of planning. -LR05: Expresses fluently, both in writing and orally with visual support, both individually and as part of teamwork, the procedures, results and conclusions derived from the learning outcomes described above.

Theoretical and Practical Contents

ANTENNAS and PROPAGATION program

Lesson 1

-Frequency bands and antenna types.

-Antenna parameters: input impedance, efficiency, radiation pattern, polarization.

Lesson 2

-Fundamentals of electromagnetic radiation. Radiation regions.

-Wire antennas: dipoles, monopoles, loop antennas, yagi antenna, log-periodic antenna, helical antennas. -Antenna arrays.

Lesson 3 -Antenna arrays.

Lesson 4 -Slot antennas. -Aperture antennas. -Horns. -Reflectors.

Lesson 5

-Propagation phenomena (diffraction, attenuation by gases, hydrometeors and clutter) and environments. -Modes of propagation: groundwave, skywave and spacewave.

-Deterministic propagation methods: Friis and Ray tracing, Ikegami and ITU-R.

-Empiric propagation models, outdoor: log-distance, specific environment models, shadowing and fading. -Fundamentals of empiric propagation models, indoor.

PRACTICAL LABORATORY WORK

1) Antenna characterization procedures. Measurements: radiation pattern, directivity, S21, S11 and impedance.

2) Several antenna types analysis and synthesis. Design and simulation.

3) Implementation of a propagation model and verification by means of comparison with measurements.

TEACHING METHODS

The lecturing hours of master classes will be devoted to explaining the theoretical background of each lesson, using slides and the blackboard for this purpose.

In the classroom-practice hours, problem-solving activities will be carried out, sometimes solely on the blackboard, sometimes with the aid of antenna-design software packages. All this will lay the groundwork of the concepts to be applied in the laboratory.

Laboratory projects will be carried out in two or three-people groups, and each group will have to deliver the required documentation regarding the results of the work. They will also have to do a presentation of them in order to be evaluated.

In the event that sanitary conditions prevent the realization of a face-to-face teaching activity and / or evaluation, a non-face-to-face modality will be set in place of which the students will be informed promptly.

TYPES OF TEACHING

	TA: Workshop	TI:	Industria	al worksh	ор		GCA:	Applied	fieldworł	c groups

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 60%

- Exercises, cases or problem sets 40%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The total score of the subject is divided into two sections:

- 60 % of the total score: assessment of the written exam.

- 40 % of the total score: assessment of the practical laboratory work. This evaluation process includes both the evaluation of individual and group work.

Electronic devices such as calculators, smartphones, smartwatches, etc cannot be used in order to answer quizzes. For the rest of the exam only calculators are allowed.

To pass the subject it is required:

- To get a score equal to or greater than 5 points out of 10 on the written exam

and

- to get a score equal to or greater than 5 points out of 10 on the practical laboratory work.

Should this requirement not be fulfilled, the final total grade will be the grade obtained in the failed part.

Assessment of the written exam:

- Only final assessment.

* Written exam in the official examination hour: set of problems and/or questions.

Assessment of the practical laboratory work:

- Continuous assessment:

* There will be oral presentations by the working groups of the laboratory about the work carried out in the projects. Each project will be given a 0-to-10 grade, and each grade will determine a third of the final grade of the laboratory part. After each presentation, there will be a question time in which all the other groups than the one that has made the presentation will have to pose at least one question per group. Otherwise, all the members of the defaulting group will be penalized with a negative point over 10 in the grade of that particular project. One negative point per each due question. The question time will conclude with the questions and comments of the professor regarding both the technical contents and the formal aspects of the presentation. The conclusions from these questions and comments will be the basis of the grade of this project. A previously published rubric, made available to the students prior to the evaluation, will be used for this evaluation. Furthermore, after the evaluation of each project is completed, the following will be delivered to each concerned person: the scores of the evaluation of the practice, carried out according to the rubric, both individual and group based, with the corresponding justifications, and a set of general observations and improvements for all students in the class.

* Students have the right to resign to the continuous assessment in accordance with the procedure and established deadlines in Article 8.3 of Student Assessment Regulations of the UPV/EHU. Then they would be assessed following the final assessment procedure: they must report a written statement for such a claim, with a deadline of 9 weeks, starting from the beginning of the four-month period.

- Additional final assessment:

* Test exam about the laboratory projects after the first written exam (in the official examination date).

* Individual.

Declining to sit: not attending the final exam call will be considered equivalent to a withdrawal (no examination attempt is used) and a grade of NS.

In the event that sanitary conditions prevent the realization of a face-to-face teaching activity and / or evaluation, a non-face-to-face modality will be set in place of which the students will be informed promptly.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The total score of the subject is divided into two sections:

- 60 % of the total score: assessment of the written exam.

- 40 % of the total score: assessment of the practical laboratory work. This evaluation process includes both the

evaluation of individual and group work.

Electronic devices such as calculators, smartphones, smartwatches, etc cannot be used in order to answer quizzes. For the rest of the exam only calculators are allowed.

To pass the subject it is required:

- To get a score equal to or greater than 5 points out of 10 on the written exam

and

- to get a score equal to or greater than 5 points out of 10 on the practical laboratory work.

Should this requirement not be fulfilled, the final grade will be the grade obtained in the failed part.

Assessment of the written exam:

- Students that got a score equal to or greater than 5 points out of 10 on the written exam of the previous call:
- * It is possible to keep the score of the written exam of the previous call without having to take the written exam again.
- Students not fulfilling the previous condition:
- * Written exam in the official examination hour: set of problems and/or questions.

Assessment of the practical laboratory work:

- Students that got a score equal to or greater than 5 points out of 10 on the practical laboratory work of the previous call: * It is possible to keep the score of the practical laboratory work of the previous call without having to take the practical exam.

- Students not fulfilling the previous condition:
- * Practical test exam after the written exam (in the official examination date).

Declining to sit: not attending the final exam call will be considered equivalent to a withdrawal (no examination attempt is used) and a grade of NS.

In the event that sanitary conditions prevent the realization of a face-to-face teaching activity and / or evaluation, a non-face-to-face modality will be set in place of which the students will be informed promptly.

MANDATORY MATERIALS

All the material is available on the eGela online teaching platform:

- PowerPoint slides for the lectures.

- Exercises to be worked on during the classroom practices.
- Guide notes of the practical laboratory work.

Deliverables will be made accessible through the online platform.

Universidad Euskal Herriko del Pais Vasco Unibertsitatea - End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 50%
- Exercises, cases or problem sets 25%
- Individual assignments 15%

- Teamwork assignments (problem solving, Project design) 10%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation of the subject will be as follows:

- An individual written exam about theoretical concepts and short practical questions, after the first weeks of the triannual (15%)

- A short report with the results of a practical use case (10%)

- Periodical reports of the lab practise and a final practical exam with questions related to the simulations developed in the lab practise (25%). Periodical reports of the lab practise must be handed over on time.

- A final written exam with theoretical questions and practical problems (50%). It is required to pass this final exam to pass the subject.

It is mandatory to complete all the lab and practical problems and to deliver the required reports in order to pass the subject.

The evaluation criteria are the following:

- Proper knowledge and comprehension of the main contents and concepts of the subject.
- Adequate relation of theoretical concepts, technological requirements and technological solutions
- Adequate application of the previous items to specific representative situations
- Accuracy of the quantitative results of practical examples

Students that choose not to participate in partial exams must notice this fact to the professor at least one week before the first partial trial. Otherwise, they will be evaluated in the partial exams, even if they are not present in the trial.

Students that choose not to participate in partial exams will be evaluated in a final exam composed of:

- A written exam containing the most relevant theoretical concepts, practical questions and problems (75%)
- The development of a lab practise, similar to those developed during the course (25%)

In case that health conditions prevent from the scheduled activities and/or the on-site examination, online alternatives will be launched and students will be punctually informed.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation will consist of a final exam composed by:

- A written exam containing the most relevant theoretical concepts, practical questions and problems (75%)

- The development of a lab practise, similar to those developed during the course, and a practical exam. The grade obtained in this part within the ordinary exam will be kept in the extraordinary exam (25%)

In case that health conditions prevent from the scheduled activities and/or the on-site examination, online alternatives will be launched and students will be punctually informed.

MANDATORY MATERIALS

The resources for the students are:

- Syllabus of the subject
- Exercises, practical problems and representative examples
- Practical cases, technical specifications of radars
- User manual of the software tool for lab simulations
- Additional bibliography

These resources will be available at virtual room for the students E-Gela.

points obtained from individual or team works.

Universidad Euskal Herriko del Pais Vasco Unibertsitatea It is mandatory to obtain 3,5 from 7 points in the exam, 0,75 points in the practices and 0,75 points in the individual works to succeed the subject.

Students which want to give up the continuous evaluation (practices and individual works), they should do so by following the current normative.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary call the evaluation will be conducted with a written exam that covers the content of the whole subject.

MANDATORY MATERIALS

BIBLIOGRAPHY

Basic bibliography

- "Electrónica de Potencia" Daniel W. Hart. Ed. Prentice Hall
- "Power Electronics: Converters, Applications and Design" N. Mohan. Ed. Jophn Wiley and Sons
- "Problemas de Electrónica de Potencia" Andrés Barrado, Antonio Lázaro, Prentice Hall.

"Electrónica de Potencia: Componentes, topologías y equipos" Salvador Martinez García, Juan Andrés Gualda Gil, Ed. Thomson

"Electrónica de Potencia" M. Rashid Ed. Prentice Hall

"Electricidad Solar. Ingeniería de los Sistemas Fotovoltaicos". Eduardo Lorenzo and cols. Progensa, 1994.

"Photovoltaic Systems Engineering", R.A. Messenger, J. Ventre, CRC Press, 2010.

Detailed bibliography

"Fundamentals of Power Electronics" R.W. Erickson, Kluwer.

"Planing and installing photovoltaic systems. A guide for installers, architects and engineers", Earthscan, 2008.

"Handbook of Photovoltaic Science and Engineering", A Luque & S. Hegedus, Jon Willey & Sons, 2011.

Journals

IEEE Transactions on Power Electronics: State of the art of the power electronics. It covers advanced and complex contents on the field, but some of the articles can be valuable for the students to extract relevant basic concepts.

Bodo´s Power Systems: Information related with the power electronics market. Students can thus know the elements that can use to design and manufacture power converters.

Photon. The photovoltaic journal. It is specialized in the most relevant aspects related with the solar photovoltaic energy.

Additionally	ur-month period, inology.So he/sh given stream, a of the course, the tences also acqu or Geotechnics, , the knowledge	the student has h ne has the necessand obtain a final p student will have uired in other subje Structures and W acquired in this co	of the integration of rea ad to take the subjects of ary skills to design and s roduct that is economica an integrated vision of ects of the same module forks, which are taught i	of Basic Operations in select the most suitab ally and environmenta an industrial process. a such as Industrial ar n parallel to the Chen e specific knowledge	n Environmen le operation (ally sustainabl This vision is nd Urban Fac nical and Biol acquired in th	tal Engineerin units to pre-tra- e. In conclus complement ilities and ogical Reactor ne specialization
Treatment 7	Fechnology, whi		e 4th year of the degree	0,		
The compet	tences to be ach	nieved by the stude	ents correspond to mod	ule M04 of Environme	ental Enginee	ring.
a) Ability to artificial.	analyze, design	, simulate and opt	imize processes and sys	stems with environme	ental relevanc	e, both natura
			design, project and exect ve strategies and contro		solutions to e	nvironmental
-	-		s, biotechnology, mass n, and valorization and t	-	-	
in the field o	of environmental	-	applied experimental pro flow systems, heat tran s.		• •	•
Because of	the learning out	comes, they shoul	ld know:			
simulators,			ogical reactor, both by cl treatment systems and t			• •
- Write and	present assignn	nents on chemical	and biological reaction	engineering.		
Theoretical ar	nd Practical Co	ntents				
Block 2. St Characteriz Block 3. Bi	ation of flow mo	lug-flow reactors: dels. Use of tracer	or active biomass recycl	0	reaction syst	ems.

concepts of the subject will be developed by means of the lecture modality, however, encouraging the participation of the students through questions that incite discussions and analysis of the reaction systems. Also part of the lecture time will be devoted to the resolution of problems individually or in groups in a participatory way. Likewise, the work in small groups will be promoted performing computer practices carrying out exercises-works in which they can use different computer tools (databases and specific software). After these sessions, a report will be delivered to the teacher with the result of the activities carried out for the follow-up of the same ones. In the laboratory practices, experimental work will be developed to obtain data related to processes that have been analysed theoretically in class.

Information and communication technologies such as spreadsheets (Excel), chemical process simulation software (Aspen Plus) and numerical methods software (Polymath) will also be employed. In addition, the eGela platform will be used to exchange information and links of interest, distribute class notes, order-submit activities and exercises, as well as to announce schedule changes/news.

"In the case of health conditions do not allow the realization of a face-to-face teaching activity and/or evaluation, a nonface-to-face modality will be activated of which students will be promptly informed."

Evaluation tools and percentages of final mark

- Written test, open questions 70%

- Continuous evaluation: 30% of the final grade of the course, which is divided as follows:

Follow-up activities: 10%

Computer practices: 6%

Laboratory practices: 6%

Team project (information search, problem solving, simulation of reaction systems, etc.): 8% 30%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The final grade of the course will be obtained by applying 70% to the grade obtained in the Individual Final Exam, and the remaining 30% of the grade will be obtained by Continuous Evaluation throughout the course. In order to take both percentages into account, it is mandatory to have passed both parts, that is, to have in each of them a grade higher or equal to 5 points out of 10. In case of not reaching the minimum of 5 points out of 10 in the Individual Final Exam, the grade obtained in the Individual Final Exam will automatically become the mark of the final grade.

Characteristics of the Final Individual Test: a written test that will account for 70% of the final grade and will consist on theoretical-practical problems and may include some theoretical questions.

Characteristics of the Continuous Evaluation: it represents 30% of the final grade of the course and will be carried out throughout the course and is mandatory. It is divided as follows:

Follow-up activities (10 %): they will be carried out individually, preferably during face-to-face classes. Their purpose is to know the degree of knowledge that the students have during the course. The questionnaires may be carried out without prior notice.

Computer practices (6%): they will be carried out individually. There will be 4 computer sessions of 3 hours each. In the first sessions the student will work with the Polymath program to solve the problems developed in the lectures. This section is directly evaluated in the final test. During the other computer sessions the student will work with the Aspen Plus program. Throughout these sessions students will learn how to work with this simulator and at the end of the last session they will have to hand in a document that will be evaluated.

Laboratory and experimental data treatment (6 %): it will be carried out in a session of 3 hours. The laboratory practice will be related to chemical kinetics or bio-gas reaction systems. It will be carried out in groups of maximum two people. During the session, the students will carry out the experimental part in which they will collect experimental data for its later treatment. Before attending the laboratory session, the students must hand in a previous work document. For the evaluation, the work team must deliver the results of the experimental data treatment with their observations and/or comments.

Team project (8 %): series of tasks (information search, problem solving, simulation of reaction systems, etc.) will be completed in small groups. It will be carried out throughout the course, and will include all the knowledge acquired for the resolution of a practical case.

However, as stated in article 8, point 3 of the regulations governing the evaluation of students in official undergraduate degrees, students will have the right to be evaluated through the final evaluation system, regardless of whether or not they have participated in the continuous evaluation system. For this purpose, students must submit in writing to the faculty responsible for the subject the resignation of continuous assessment. In the particular case of this course, which consists of 15 weeks, the resignation letter must be sent before week 9 from the beginning of the term.

The resignation to the continuous evaluation does not exempt from the evaluation of the competences that are worked in the continuous evaluation. That is why those students who have not participated, or who have failed the part of the subject evaluated in a continuous way and who present themselves for the final evaluation will have to perform:

a) Final Individual Test (70 %).

b) A test or activity to evaluate and measure the learning outcomes acquired in the laboratory practice (15 %).

c) A simulation of a reaction system using a process simulator (15 %).

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In this call there will be a Final Individual Test (70% of the grade). In case of not reaching the minimum of 5 points out of 10 in the Final Individual Test, the grade obtained in this test will automatically become the final grade of the final grade. The remaining 30% will be taken from the grade of the continuous evaluation, provided that this grade is passed. In case of having exposed the aim of resigning to the continuous evaluation or having failed it, the student will also have to be evaluated for the corresponding competencies:

- A test or activity to evaluate and measure the learning outcomes acquired in the laboratory practice (15 %).

- A simulation of a reaction system using a process simulator (15 %).

The 30% of the continuous evaluation grade will be kept only until this call, i.e., it will not be kept for subsequent years.

Evaluation tools and percentages of final mark

Universidad Euskal Herriko del Pais Vasco Unibertsitatea

- Multiple choice test 40%
- Exercises, cases or problem sets 20%
- Individual assignments 35%
- Oral presentation of assigned tasks, Reading; 5%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Continuous assessment is used in both ordinary and extraordinary assessment sessions. The completion of activities, computer lab reports and the exposition are included in the assessment criteria (60%). Students are also required to take a final written exam in May/June (40%). It is essential to pass this final exam (minimum grade: 5.0/10.0) to average it with the grades obtained during the semester (activities, computer lab reports and oral defence:

Any student wishing to waive continuous evaluation and wishing to be marked by final assessment instead of by continuous assessment in the ordinary session should request this in a written document from the lecturer responsible for the course before the ninth week after the course starts. In this case, the student must do the following in May/June:

-Written exam: multiple choice test (40% of final grade)

-Resolution of a practical case (50% of the final grade)

-Computer lab test (10% of the final grade)

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Students who do not pass the subject in the ordinary call are required to take a written exam similar to that in the ordinary session (40% of the final mark). The remaining 60% of the mark will correspond to the activities carried out throughout the semester (practical activities, computer lab reports and oral presentation).

Any student who requested to be qualified by final assessment in the ordinary session will be marked according to the same criteria as in the ordinary session.

MANDATORY MATERIALS

Materials required to follow the sessions will be shared with the students though eGela virtual platform

(https://egela.ehu.eus/):

-Lecture materials and documents,

-Instructions for practical activities and computer lab guides,

-Links to useful websites and useful reports.

To pass the course will require that all three parts that make up the final mark are passed. The deadline for renouncing continuous assessment will be that set by UPV/EHU regulations.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation of the second call will have the same composition as the ordinary call. The notes of individual exercises and laboratory project will be saved, if approved

in the ordinary call, for the extraordinary session.

Students who have not passed the part corresponding to the individual exercises or the lab project will have a complementary test to evaluate those contents.

MANDATORY MATERIALS

Presentation notes used in classes. Notes of the laboratory project. This course has a MOODLE web page (eGela).

- 2.3. Equations and solutions of the transmission line
- 2.4. Impedance transformers
- 2.5. Reflections on transmission lines
- Practical laboratory work:
- P1. Measurement of RF signals with the spectrum analyzer
- P2. Measurement of the frequency on waveguides
- P3. Measurement of coaxial cables with the network analyzer
- P4. Measurement of the standing wave ratio on waveguides
- P5. Measurement of antennas

TEACHING METHODS

Students of this subject work individually or in groups. On one hand, students work individually in the lectures + practical classroom work; on the other, they work in groups of five or six in the practical laboratory work. The methodology is explained in more detail below:

- Lectures: theoretical basics and concepts are explained using PowerPoint presentations.

- Practical classroom work: problem-solving activities are carried out; these problems are related to the theory explained in the lectures.

- Practical laboratory work: experimental measurements are performed and processed, and then recorded in standard reports, in groups of five or six.

In the event that health conditions prevent the performance of a teaching activity and / or evaluation in person, will activate a mode of non-presence of which students will be informed promptly.

TYPES OF TEACHING

Types of teaching	Μ	S	GA	GL	GO	GCL	ТА	ТІ	GCA
Hours of face-to-face teaching	37,5		15	7,5					
Horas de Actividad No Presencial del Alumno/a	56,25		22,5	11,25					

 Legend:
 M: Lecture-based
 S: Seminar
 GA: Applied classroom-based groups

 GL: Applied laboratory-based groups
 GO: Applied computer-based groups
 GCL: Applied clinical-based groups

 TA: Workshop
 TI: Industrial workshop
 GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 70%
- Multiple choice test 18%
- Teamwork assignments (problem solving, Project design) 12%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The total mark of the subject is divided into two sections:

- 88% of the total mark: assessment of the lectures + practical classroom work.
- 12% of the total mark: assessment of the practical laboratory work.

To pass the subject it is required:

- To get at least a 50% pass mark on the lectures + practical classroom work
- and

- to get at least a 50% pass mark on the practical laboratory work.

Assessment of the lectures + practical classroom work:

- Continuous assessment:

* Questionnaires in the eGela platform (18% of the total grade).

* Set of problems and/or questions in a final written exam in the official examination date of the final assessment test (70% of the total grade).

* Students have the right to be graded by final assessment: they must present a written request to do this, within 9 weeks, starting from the beginning of the four-month period.

- Final assessment:

* Set of problems and/or questions in a final written exam in the official examination date of the final assessment test (88% of the total grade).

Assessment of the practical laboratory work: - Continuous assessment:

* Standard reports of the measurements obtained (12% of the total grade).

* Students work in groups and each report must be submitted after each session.

* Students have the right to be graded by final assessment: they must present a written request to do this, within 9 weeks, starting from the beginning of the four-month period.

- Final assessment:

* Practical exam after the written exam in the official examination date of the final assessment test (12% of the total grade).

* Individual.

Withdrawal from a call: non-attendance at the exam call in the official examination date of the final assessment test will result in a withdrawal (NOT PRESENTED will be applied).

In case of health conditions do not allow the face-to-face teaching and/or evaluation activity, and on-line modality will be prepared and the students will be informed.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The total mark of the subject is divided into two sections:

- 88% of the total mark: assessment of the lectures + practical classroom work.

- 12% of the total mark: assessment of the practical laboratory work.

To pass the subject it is required:

- To get at least a 50% pass mark on the lectures + practical classroom work

and

- to get at least a 50% pass mark on the practical laboratory work.

Assessment of the lectures + practical classroom work:

- Students who achieved at least a 50% pass mark in the assessment of the lectures + practical classroom work of a previous call:

* It is possible to keep the mark of the assessment of the lectures + practical classroom work of the previous call without having to take the written exam again (88% of the total grade).

- Students not fulfilling the previous condition:

* They will have to take the written exam in the official examination date of the final assessment test (88% of the total grade).

Assessment of the practical laboratory work:

- Students who achieved at least a 50% pass mark in the assessment of the practical laboratory work of a previous call: * It is possible to keep the mark of the assessment of the practical laboratory work of the previous call without having to

take the practical exam (12% of the total grade). - Students not fulfilling the previous condition:

* They will have to take the practical exam after the written exam in the official examination date of the final assessment test (12% of the total grade).

Withdrawal from a call: non-attendance at the exam call in the official examination date of the final assessment test will result in a withdrawal (NOT PRESENTED will be applied).

In case of health conditions do not allow the face-to-face teaching and/or evaluation activity, and on-line modality will be prepared and the students will be informed.

MANDATORY MATERIALS

Lecture materials and notes are available in the eGela virtual platform:

- PowerPoint slides used in the lectures.
- Questions from the exercises worked on in the practical classroom work.
- Manuals and standard reports of the practical laboratory work.

Information about the use of materials, media and resources:

- During teaching activities (continuous assessment):
- * No telephone systems, devices or any other type of help are permitted, except as provided for below.
- * Students are permitted to use books or course notes as well as electronic or computer systems or devices. Should these systems or devices have access to the Internet, any search for other than instructional materials will be prohibited.

- In the final assessment test (both continuous assessment and final assessment):

* Neither books or course notes nor telephone, electronic or computer systems or devices nor any other type of help are permitted, except as provided for below.

* Students are only permitted to use calculators.

10.- Security in Web Systems

Every day more and more data is in systems connected to the Web that can be accessed from anywhere on the planet. There are many aspects of security that must be taken into account in the implementation of such systems to prevent unwanted access.

11.- The human factor

Throughout this topic, social engineering and different ways of protecting people's information will be studied, since they are often the weakest link in the information protection chain.

12.- Malware What is malicious code (malware)? How can it be detected and avoided? This topic will look at the main ways to protect yourself from malware and its effects. To do this, we will study what types of malware exist, the characteristics of each of them and their effects on information systems.

13.- Legislation

In the field of computer security it is essential to know the current legislation in this area. This topic will analyze the most important laws that are in force and their effects on information systems.

14.- Computer forensics

In this topic, the procedures for the autopsy of a computer equipment will be studied.

15.- Talks (To be defined) Talks about Bitcoin, Pentest, etc. by industry experts

TEACHING METHODS

The master classes (M) will be used mainly for the presentation of the theoretical concepts associated with computer security and the resolution of doubts raised by the students. However, in some master classes and in some computer practices (PO) these concepts will be reinforced through the resolution of exercises, either individually or in small groups. It is recommended to use the laptop in class, especially with a GNU/Linux operating system.

PO classes that are not used for the resolution of exercises, will be used to apply the active methodology of Problem-Based Learning. From time to time students will be provided with a series of exercises that they can work on individually or in groups.

In case of confinement, classes and tutorials will be carried out telematically. The evaluation system will continue to adapt the tests for online performance.

TYPES OF TEACHING

Types of teaching	Μ	S	GA	GL	GO	GCL	ТА	TI	GCA
Hours of face-to-face teaching	45				15				
Horas de Actividad No Presencial del Alumno/a	67,5				22,5				

Legend: M: Lecture-based

TA: Workshop

S: Seminar

GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups

TI: Industrial workshop

GA: Applied classroom-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 10%

- Multiple choice test 20%
- Exercises, cases or problem sets 30%
- Teamwork assignments (problem solving, Project design) 40%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the ordinary call, by default, the students are covered by the continuous evaluation system, although there is the option of taking advantage of the final evaluation indicating it by email, at the latest before the two weeks before the 3rd exam. In the continuous evaluation system, the evaluation will be divided into three parts, each of them with a theoretical and a practical exam, whose grades will average. Each exam will deal with the subject seen in class and the laboratory reports made up to that date and since the previous exam.

In addition, throughout the semester a series of assignments will be carried out that will influence the final grade of the subject to different extents. In the final evaluation system there will be a single theoretical and a practical exam that will correspond to the entire syllabus of the subject. The final grade of the subject will be calculated using the arithmetic average of both exams.

ASSIGNMENT EVALUATION:

The detection of plagiarism anywhere in a work will mean a score of 0 in that work. The works must be written correctly, so at the very moment a third serious spelling mistake is detected, the work will no longer be corrected and its mark will be the one corresponding to the part of it that has been evaluated.

COPY CASES:

If a copy is detected between jobs from two different groups, both jobs will be evaluated with 0. In the case of exams, article 46.2 of the current regulations regarding the evaluation of students will apply.

WAIVER OF THE CALL:

To renounce the call and appear as "Not Presented" in the continuous evaluation mode, it is enough not to sit for the 3rd exam. In the final assessment mode, it is enough not to sit for the final exam.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Students who do not pass the subject in their ordinary call will have to take a theoretical exam and a practical one in the extraordinary call on the complete syllabus of the subject. Students who have followed the continuous evaluation system will have the possibility to indicate in the exam itself if they want the final grade of the subject to be calculated using only the grades of the exams or if they want the grade of the work carried out throughout the semester to be taken into account.

WAIVER OF THE CALL: In case of not taking the theoretical or practical exam, an assessment of "Not Presented" will be obtained.

MANDATORY MATERIALS

Class notes, support material for teaching in the classroom and laboratories.

4: Loads on buildings.

Applicable regulation CTE-SE-AE. Load hypothesis. Security coefficients. Combinations of loads.

5: Characterization of industrial buildings.

Basic schemes to calculate industrial buildings. CTE-SE-A, CTE-SE-SE. Typologies of industrial buildings. Trusses and beams.

Porticos of rigid knots. Sizing of structural elements. Roofing materials. Purlins. Pillars or columns. Calculation of bracing elements. Windproof beams.

6: Introduction to reinforced concrete.

Normative. Cement. Types of cement. Water. Aggregates. Additives. Reinforcements. Properties of fresh concrete. Properties of hardened concrete. Durability. Categorization of concretes. Adherence. Layout of reinforcements.

7: Bases of calculation of reinforced concrete sections.

Ultimate limit states. Service Limit States. Characteristic values and calculation values. Security Coefficients. Geometrical and mechanical characteristics of sections.

8: Sizing of reinforced concrete sections.

Simplified calculation diagrams. Deformation domains. Dimensioning of rectangular sections with simple and compound bending. Reinforced concrete supports. Simple compression. Minimum eccentricity. Buckling. Transverse reinforcement and shear force. Contribution of concrete. Sizing of reinforcements.

9: Matrix calculation of structures.

Rigidity method. Calculation basis. Displacements, forces and torques, and reactions. Loads applied on the bars.

TEACHING METHODS

The lectures will have explanations of the theoretical part of the subject, basic and essential for the realization of the practical parts.

In the seminar exercises, reports (team work), oral presentations and other tasks of practical application will be assigned, requiring the students to apply their knowledge to practical cases.

In computer practices problems will be solved using different software.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	60	15			15				
Horas de Actividad No Presencial del Alumno/a	60	40			35				

Legend: M: Lecture-based GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups TA: Workshop

S: Seminar

TI: Industrial workshop

GA: Applied classroom-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 50%
- Exercises, cases or problem sets 50%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The percentage of the final grade corresponding to each of the evaluation systems used in the subject is the following:

- 50% Various assignments developed throughout the semester (reinforced concrete practices, problems, work of a truss, work-project...).

- 10% Partial examination of the theory of Reinforced Concrete.

- 40% Final written exam (theory and practical exercise).

In order to pass the subject, the obligation to exceed 40% of the maximum possible score in all the following partial notes:

- in the written final exam (a minimum of 4 out of 10 being required for both the theoretical part and the practical exercise)
- in the exercises corresponding to the calculation of a truss
- in the partial examination of reinforced concrete theory
- in the work-project carried out in a group
- in the practical exercises of reinforced concrete

The student will be qualified in the ordinary call if he/she attends the final test. Therefore, in order to renounce evaluation, it is sufficient not to attend this final test.

In accordance with article 8 of the regulations governing the evaluation of students in official degree programs, evaluation systems, students who request the final evaluation of the subject, in addition to the final written exam, must deliver and defend, on the date that is established, the reports corresponding to the calculation of a truss and the work-project of an industrial structure, as well as complete the examination of the theory and the practical exercise for the sizing of sections of reinforced concrete.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary call will be qualified only students who attend the final written exam.

In accordance with article 9 of the Regulations governing the Evaluation in the Extraordinary Call, students who have not delivered the different tasks developed during the semester must prove attainment of knowledge and competences inherent to the subject through a written final exam, in addition to a specific test, which may include an oral exam and the completion of exercises with the calculation software used in the subject. The evaluation of the competences and learning results developed in the reports corresponding to the calculation of a truss and the work-project will be exigible. For this reason, the delivery of these documents will be allowed up to the date of the final examination, unless other planning is established and communicated through eGela, before the review of the ordinary call. Students who have not participated in the continuous evaluation and do not wish to take advantage of this new delivery, must communicate before the date established for the extraordinary call their interest in being evaluated in it, in order to prepare the evaluation activities necessary to evaluate and measuring learning outcomes in a comparable way, in accordance with the provisions of the aforementioned article 9.

CONTENIDOS TEÓRICO-PRÁCTICOS

- Lesson 1: Force systems

Basic knowledge of calculus with vectors. Definitions and properties of the momentum generated by a force acting about an axis and a point. Concept and properties of a pair of forces. Equivalence and reduction of force systems.

- Lesson 2: Centroids

Concept and properties of gravity centre and static moment. Centroids of elemental figures. Theorems of Pappus-Guldin.

- Lesson 3: Static equilibrium

Study of structural systems, fundamental axiom of the static equilibrium of a rigid body. Concepts of links and mechanical action. Calculus of the forces and reactions that appear in the different elements of a mechanical system. Analysis of isostatic structures and methods solve lattices.

- Lesson 4: Friction

Study of the simplified hypothesis of Coulomb to analyse the friction in a sliding movement, friction coefficient and friction angle. Industrial applications of the friction.

- Lesson 5: Funicular bodies

Equilibrium study of funicular bodies, cables working under the effect of point and distributed forces. Study of catenaries.

- Lesson 6: Kinematics of the rigid body

Velocity and acceleration concepts applied to a particle. Analysis of the simple movements of translation and rotation of a solid body. Meaning of the angular velocity vector and angular acceleration vector. Law of vector derivatives in mobile frames. Velocity and acceleration fields. Study of the relative movement of a point and a body with respect a mobile system.

- Lesson 7: Kinematics of planar movement

Particularities of planar motions. Concepts of instant centre of rotation and how its position changes in time. Concepts of moving centrode and fixed centrode. Geometry of the planar movement, graphical calculus of velocities. Study of accelerations in a pure rolling movement. Instantaneous acceleration centre.

- Lesson 8: Inertia propierties of solid bodies

Inertia moments with respect to axis, planes and points. Inertia products. Steiner theorems. Inertia tensor and the main inertia direction of a body.

- Lesson 9: Dynamics of the rigid body

Elemental magnitudes in dynamics, quantity of movement, kinematic moment and kinematic energy. Fundamental theorems in dynamics. Expressions of the kinematic moment and the kinematic energy in solid bodies. Concept of inertia force and gyroscopic momentum. Application of D'Alembert principle in the dynamic analysis of mechanisms. Energetic theorems.

- Lesson 10: Dynamics of bodies with a fixed axis

Study of bodies with a rotation movement about a fixed axis. Calculus of the reaction forces in the links. Equilibrium of rotors.

- Lesson 11: Dynamics of planar movement

Study of the magnitudes and equations of dynamics for a planar case. Analysis of the different possible cases and how to solve them. Application to mechanical systems that are part of machines and mechanisms.

- Lesson 12: Inertia momentums of a surface

Description of the moments and products of inertia for planar surfaces. Main moments of inertia and main directions of inertia, obtained by applying the circle of Mohr.

- Lesson 13: Internal forces

Concept of internal force in a section of a body. Axial force, shear force and bending moment. Representation of the corresponding diagrams.

- Lesson 14: Normal tensions

Concept of normal tension and unitary deformation in the axis of a body. Relation between the tension and the deformation, Hooke law. Relation between the tensions and the internal forces in a section.

Success on transmission depends on the quality of the transmitted signal and of the transmission media's features. The analysis of the signal types and transmission and physical media allows to understand that dependency

LOCAL AREA NETWORKS.

Identification and study of the most relevant features of the local area networks: transmission media, transmission mode, topology, and access media techniques.

WIRELESS NETWORKS

Study of the most used protocols in wireless networks. Examples of creation of a wireless network using the resources of Linux operative system.

E.)

COMMUNICATIONS SECURITY

The needs of communications security through networks are studied. The configuration of a firewall with "iptables" is shown.

TEACHING METHODS

Theory class: The concepts needed are explained both to achieve the knowledge objectives and as a tool to allow free discussion and generate curiosity among the students.

Classroom practices: Used for exercises, problems and work exhibition. Students' participation is facilitated.

Laboratory practices: Practice sessions will allow the practice of the knowledge acquired in the theory sessions and its application to real problems.

TYPES OF TEACHING

Types of teaching	Μ	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	30		15	15					
Horas de Actividad No Presencial del Alumno/a	45		30	15					

S: Seminar

GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups TI: Industrial workshop

GA: Applied classroom-based groups GCA: Applied fieldwork groups

Evaluation methods

Legend:

- End-of-course evaluation

Evaluation tools and percentages of final mark

M: Lecture-based

TA: Workshop

- Written test, open questions 60%

- Exercises, cases or problem sets 20%

- Teamwork assignments (problem solving, Project design) 20%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

a) Continuous Evaluation:

- Written exam with a value of 60% of the final grade. The exam will be carried out in a test that will coincide with the Ordinary Call of the Center. It will be necessary to pass this exam to be able to do average.

- The rest of the evaluation activities will have a value of 40% of the final grade: laboratory practices (20%), group and individual activities (20%).

b) Final Evaluation (for students who request it):

It will consist of a single final test that will correspond to 100% of the final grade for the subject and will coincide with the Ordinary Call of the Center. This final test will have a written part (60% of the final grade) and a practical part to be done in the laboratory (40% of the final grade). It will be necessary to pass both parts of the final test.

To apply for the final assessment system (b), students must submit their waiver of continuous assessment in writing to the teaching staff responsible for the subject. There will be a period of 9 weeks to present the resignation from the beginning of the four-month period.

Resignation of the students to a call:

In the case of continuous assessment, students may withdraw from the call within a month before the end date of the course's teaching period. This resignation must be submitted in writing to the teaching staff responsible for the subject.

In the case of a final evaluation, failure to take the test set on the official exam date will mean the automatic resignation of the corresponding call.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

It will consist of a single final test that will correspond to 100% of the final grade for the subject and will coincide with the Extraordinary Call of the Center. This final test will have a written part (60% of the final grade) and a practical part to be done in the laboratory (40% of the final grade). It will be necessary to pass both parts of the final test.

Students who have completed the subject with continuous assessment in the current academic year may maintain the weighting of the results obtained in the course, in which case the assessment will be similar to the ordinary call.

MANDATORY MATERIALS

Transparencies and notes of the subject (practice scripts, exercises, auxiliary documents).

In cases where capacity limitations require it, a second classroom will be enabled at the same time to allow the development of the class to be followed (using streaming or similar techniques). In the event that the health situation

requires it, teaching will become online, for which the resources provided by the university will be used (eGela, videoconference, ...)

In the event that classes cannot be held in person, classes will be held online. As this is an alternative to an exceptional situation, all the tools and grading percentages that take place during this type of class, and are affected by the situation, will be adapted to the online world by the teacher(s) of the subject. These adaptations will be properly disseminated through eGela or other usual channels of communication with that teacher and with their students. The date/time of these classes will be the same as that marked by the center in its face-to-face calendar.

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 60%

- Teamwork assignments (problem solving, Project design) 40%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The subject has two modes of evaluation: the final (or overall) evaluation and the continuous evaluation. Continuous assessment, to which students may voluntarily take part, is offered exclusively to students who can carry out continuous monitoring of the subject within the established framework of dedication and attendance at face-to-face activities, as indicated in article 43 of the current regulations regarding student assessment.

Pre-registration in the continuous evaluation mode will take place on the established dates. The pre-registration will become final after the confirmation of the request by the student on the dates established (by week 12 with 70% of the weight of the evaluation already taken) and after verification of the partial performance by the teaching staff.

The different activities of continuous evaluation with their corresponding weights will be the following:

- Group project with Deliverables (40%)

- Partial and final exams (60%)

Continuous assessment will require attendance at face-to-face classes, practical activities, assignments and exams. To pass the subject (final grade), the student must obtain at least 3 points in the overall of the different exams (partial and final), out of a total of 6 points.

In the event that the overall mark of the exams does not exceed 3 points (out of a total of 6), the mark of the practical works will not be included in the average, that is, the final mark will be calculated by weighting the mark of the exams over 10.

The FINAL evaluation for students who do not carry out the continuous evaluation consists of: - Final Exam (100%)

The test will consist of a written exam that will cover 100% of the contents of the subject. To take this test, it is recommended that you have previously completed the practical work for the subject.

NO SHOW:

- When the student does not appear for the final written exam, they will obtain a "Not Presented" qualication regardless of their participation in the continuous evaluation.

COPY CASES:

Article 44 of the current regulations regarding the evaluation of students will be applied.

ONLINE EXAM (EXCEPTIONAL SITUATIONS)

In the event that the exam cannot be carried out in person, the exam will be carried out electronically. As this is an alternative to an exceptional situation, this type of exam will follow the structure, guidelines and specificities established by the teacher(s) of that subject, and which will be properly disseminated through eGela or other usual channels of communication with that teacher and with your students. The date/time of said exam will be, as always, the one marked by

the center in its official calendar.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The EXTRAORDINARY evaluation consists of:

- Final Exam (100%)

This will consist of a written exam that will cover 100% of the contents of the subject. To take this test, it is recommended that you have previously completed the practical work for the subject.

ONLINE EXAM (EXCEPTIONAL SITUATIONS)

In the event that the exam cannot be carried out in person, the exam will be carried out electronically. As this is an alternative to an exceptional situation, this type of exam will follow the structure, guidelines and specificities established by the teacher(s) of that subject, and which will be properly disseminated through eGela or other usual channels of communication with that teacher and with your students. The date/time of said exam will be, as always, the one marked by the center in its official calendar.

Hash Code is a team programming competition, organized by Google, for students and professionals around the world. You pick your team and programming language and we pick an engineering problem for you to solve. This year's contest kicks off with a Qualification Round, where your team can compete virtually from wherever you'd like, alongside your virtual Hub. Top teams will then be invited to compete from our virtual World Finals. https://codingcompetitions.withgoogle.com/hashcode/archive

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The criteria established in the current regulations are applied for the choice of assessment system (continuous or final), and also for changes to the assessment system (from continuous to final or vice versa).

===Continuous assessment===

This will consist of 3 mid-course exams and 6 practical work sessions.

The assessment of the subject is divided into 3 parts. The weight of each of the 3 parts in the final grade of the subject is as follows:

- Part I represents 25% of the final grade

- Part II represents 40% of the final grade

- Part III represents 35% of the final grade

Each of the parts consists of a mid-course exam and 2 practical sessions. All the test will be marked out of 10 points.

The mid-course exams will be done during lecture hours and the dates will be announced at the start of the term.

The practical sessions will be done during the computer work groups and attendance at these is COMPULSORY. Teamwork will be done in all the practical sessions (usually teams of 2 people) and students will not be allowed to work individually. Assessment of the practical sessions will be done during the computer work groups and the grade PASSED/NOT PASSED will be communicated to the student immediately. An unjustified absence from a work group will be graded as NOT PASSED for the corresponding practical work session. The grade for the practical session will be individual and will be made public after it has been completed. The calendar of practical sessions and the corresponding work groups will be announced at the start of the term.

In each of the 3 parts of the subject, it is COMPULSORY to pass the practical sessions to take the mid-course exam. Otherwise, the grading for that part will be 0 points. The deadline for passing the practical sessions will be announced at the start of the term.

It is also COMPULSORY to exceed the minimum grade in all the mid-course exams (3.5/10) and in the weighted average (5/10) of these to pass the subject. If these minimum marks are not reached, the maximum grade for the subject will be 4 points.

The grade for each part of the subject will be calculated using the weighted average between the grade for the midcourse exam (75%) and that of the practical sessions (25%) if the minimum grade is reached in the mid-course exam. Otherwise, the grade will be 0 points.

===Final assessment===

This will be made through a final written exam and a final practical exam.

The final exams (written and practical) will be done on the day and time officially set by the school, first the final written exam and then the final practical exam. The grade for both exams will be between 0 and 10 points.

Optionally, the final practical exam can be validated by passing the practical laboratory sessions proposed in the modality of continuous assessment.

To pass the subject, the student must pass both final exams, and the final grade will be obtained by calculating the weighted average between the mark for the written exam (75%) and the practical exam (25%). Otherwise, the final grade final may not be higher than 4 points.

===Presentation vs. Withdrawal===

- The grade obtained will be "Presented" if the student takes the third mid-course exam (in continuous assessment) or any of the final exams (in final assessment).

- The grade obtained will be "Not Presented" if the student does not take either the third mid-course exam (in continuous assessment) or any of the final exams (in final assessment).

===Code of misconduct===

The criteria stated in Article 67 of the current regulations will apply.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The criteria established in the current regulations are applied for the choice of assessment system (continuous or final), and also for changes to the assessment system (from continuous to final or vice versa).

===Continuous assessment===

The assessment of the subject is divided into 3 parts (I, II and III). Each of the parts consists of a mid-course exam and 2 practical sessions. It is COMPULSORY to have passed all the practical sessions during the course. Otherwise, the grading of the corresponding mid-course exam will be 0 points. The weight of each of the 3 parts in the final grade of the subject is as follows:

- Part I represents 25% of the final grade
- Part II represents 40% of the final grade
- Part III represents 35% of the final grade

All the mid-course exams will be marked out of 10 points.

It is also COMPULSORY to exceed the minimum grade in all the mid-course exams (3.5/10) and in the weighted average (5/10) of these to pass the subject. If these minimum marks are not reached, the maximum grade for the subject will be 4 points.

The grade for each part of the subject will be calculated using the weighted average between the grade for the mid-course exam (75%) and that of the practical sessions (25%) if the minimum grade is reached in the mid-course exam. Otherwise, the grade will be 0 points.

===Final assessment===

This will be made through a final written exam and a final practical exam.

The final exams (written and practical) will be done on the day and time officially set by the school, first the final written exam and then the final practical exam. The grade for both exams will be between 0 and 10 points.

Optionally, the final practical exam can be validated by passing the practical laboratory sessions proposed in the modality of continuous assessment.

To pass the subject, the student must pass both final exams, and the final grade will be obtained by calculating the weighted average between the mark for the written exam (75%) and the practical exam (25%). Otherwise, the final grade final may not be higher than 4 points.

===Presentation vs. Withdrawal===

- The grade obtained will be "Presented" if the student takes the third mid-course exam (in continuous assessment) or any of the final exams (in final assessment).

- The grade obtained will be "Not Presented" if the student does not take either the third mid-course exam (in continuous assessment) or any of the final exams (in final assessment).

=== Code of misconduct ===

The criteria stated in Article 67 of the current regulations will apply.

MANDATORY MATERIALS

All the necessary material will be available at the university's eGela platform.

• 60% of the grade: Practical exams in which students will have to solve several exercises like those presented

throughout the module.

• 40% of the grade: Development of an individual assignment in which students will have put in practice virtualization, containerization and orchestration techniques.

Students who choose final assessment will get their grade based on a single exam at the end of the module. This exam has a written part related to the theoretical aspects of the module (50% of the grade) and a practical part with exercises similar to those done in the practice sessions (50% of the grade).

For more information, get in touch with the teaching staff.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

For more information, get in touch with the teaching staff.

MANDATORY MATERIALS

All the necessary material will be available at the university's eGela platform.

COURSE GUIDE 2023/24			
Faculty 363 - Faculty of Engineering - Bilbao	Cycle].	
Degree GIIGSI30 - Bachelor's Degree in Computer Engineering in Management and In	Year	Fourth ye	ar
COURSE			
27711 - Data Mining	Credi	ts, ECTS:	6

COURSE DESCRIPTION

* OBSERVE: THIS COURSE IS SET AS AN English Friendly Course (EFC): Spanish is the teaching-medium. Both the lectures and the main teaching-material are in Spanish. However, student-interventions in English are welcome in class.

The lecturers are willing to tutor, conduct examinations and/or accept results, works and e-mails in English. The course aims at international students with either a good command of Spanish or a medium level of Spanish and good command of English.

Good programming skills are required as well as basic statistics.

Related topics:

- computation
- statistics and operative research
- machine learning
- artificial intelligence
- business intelligence
- decision support systems

CONTEXTO DE LA ASIGNATURA EN EL GRADO:

Esta asignatura se enmarca dentro del grupo de asignaturas que trabajan las competencias específicas del Móudulo Sistemas de Información (M03). Concretamente, trata de conocer el potencial, la problemática y la tecnología de análisis y extracción de conocimiento sobre sistemas de información, así como las técnicas de almacenes de datos para facilitar el procesamiento analítico de apoyo a la toma de decisiones estratégicas. También se aplicarán las técnicas de minería de datos apropiadas para problemas concretos de extracción de conocimiento.

RELACIONES CON OTRAS ASIGNATURAS

La asignatura tiene una fuerte componente práctica que recomienda un nivel alto de programación y una base de estadística. Se recomienda haber superado los siguientes cursos:

- Programación Modular y Orientación a Objetos
- Estructuras de Datos y Algoritmos
- Métodos Estadísticos de la Ingeniería
- Investigación Operativa

RELACIÓN CON EL ÁMBITO PROFESIONAL: La Minería de Datos contribuye en el desarrollo de competencias profesionales brindando herramientas para buscar la racionalidad cuando se requiere encontrar la solución a problemas en el marco del Business Intelligence. Comercio electrónico, entorno de soporte a las decisiones, riesgo y valoración. Son técnicas muy arraigadas en el mercado de gestión y análisis de datos en el marco empresarial. También se aplicarán las técnicas de minería de datos apropiadas para problemas concretos de extracción de conocimiento. La Minería de datos se ubica en el área de Inteligencia Artificial, que aplicada a la empresa se conoce como Business Intelligence. Ejemplos destacables de empresas donde se requieren las competencias que se trabajan en esta asignatura:

- ChatGPT
- IBM Watson Project
- Google (Big Data Tools)
- Oracle (Data Mining Libraries)

Temas afines:

- computación
- estadística e investigación operativa sistemas de apoyo a la decisión
- inteligencia artificial
- aprendizaje automático
- business intelligence

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT

* OBSERVE: THIS COURSE IS SET AS AN English Friendly Course (EFC): Spanish is the teaching-medium.

By the end of the course the student will be able to:

describe information extraction fundamentals and its potential scope on information systems. apply data mining approaches to particular tasks related to knowledge discovery, business intelligence and decision support systems.

COMPETENCIAS DE LA ASIGNATURA: A continuación se enumeran las competencias de la asignatura y para cada una de ellas se establecen asociaciones con las competencias del módulo al que pertenece esta asignatura y también con las competencias transversales del catálogo de la UPV/EHU (posteriormente se describen tanto las competencias de módulo como las transversales)

CA1: Reconocer los beneficios del uso sistemático de técnicas de extracción de conocimiento para la obtención de modelos y patrones predictivos o descriptivos. Competencias asociadas: M03CM02, M03CM04, CT8

CA2: Conocer las distintas técnicas de aprendizaje automático y estadísticas utilizadas en minería de datos, su potencial, su coste computacional y sus limitaciones de representación y de inteligibilidad. Competencias alineadas: M03CM01, M03CM05, CT3

CA3: Elegir, para un problema concreto, qué técnicas de minería de datos son más apropiadas. Competencias asociadas: M03CM03, M03CM06, CT8

CA4: Generar los modelos y patrones elegidos utilizando una herramienta o paquete de minería de datos. Competencias asociadas: M03CM05, CT3

CA5: Evaluar la calidad de un modelo, utilizando técnicas sencillas de evaluación. Competencias asociadas: M03CM05 CA6: Conocer la problemática especial de la minería sobre la web y las técnicas más usuales. Competencias asociadas: M03CM01, M03CM06, CT8

COMPETENCIAS ESPECÍFICAS del MÓDULO M03: Sistemas de Información:

M03CM01 - Capacidad para integrar soluciones de tecnologías de la información y comunicaciones y procesos empresariales para satisfacer las necesidades de información de las organizaciones de las organizaciones, permitiéndoles alcanzar sus objetivos de forma efectiva y eficiente, dándoles así ventajas competitivas

M03CM02 - Capacidad para determinar los requisitos de los sistemas de información y comunicación de una

organización atendiendo a aspectos de seguridad y cumplimiento de la normativa y la legislación vigente.

M03CM03 - Capacidad para participar activamente en la especificación, diseño, implementación y mantenimiento de los sistemas de información y comunicación.

M03CM04 - Capacidad para comprender y aplicar los principios y prácticas de las organizaciones, de forma que puedan ejercer como enlace entre las comunidades técnica y de gestión de una organización y participar activamente en la formación de los usuarios.

M03CM05 - Capacidad para comprender y aplicar los principios de la evaluación de riesgos y aplicarlos correctamente en la elaboración y ejecución de planes de actuación.

M03CM06 - Capacidad para comprender y aplicar los principios y las técnicas de gestión de la calidad y de la innovación tecnológica en las organizaciones.

COMPETENCIAS TRANSVERSALES:

Competencias transversales que reúne el "Catálogo de Competencias Transversales de la UPV/EHU" (https://www.ehu.eus/es/web/enplegua/competencias-transversales) referenciadas, debajo, siguiendo la notación del catálogo referido. Concretamente:

CT3 Comunicación y Plurilingüismo. Saber comunicar y transmitir conocimientos, habilidades y destrezas correspondientes a un graduado en Ingeniería Informática de Gestión y Sistemas de Información. CT8 Trabajo en Equipo. Acciones colaborativas y fomento de co-responsabilidad.

RESULTADOS DE APRENDIZAJE:

R1: Identificar fuentes de incertidumbre inherentes a los problemas de extracción de conocimiento en los contextos de Business Intelligence, analizar cuantitativamente datos disponibles y proponer soluciones adaptadas al marco de aplicación. Competencias alineadas: CA2, CA3, CA4, CA5, M03CM01, M03CM04.

R2: Diseño, implementación, documentación de sistemas de inferencia en entornos de aplicación reales en entornos de trabajo en grupo de forma eficaz. Competencias alineadas: CA1, CA2, CA3, CA6, M03CM03, M03CM02, CT8 RA3: Análisis de sensibilidad a la vista de resultados experimentales en la toma de decisiones con riesgo para esOmar el potencial de un sistema de minería de datos así como la comunicación de los resultados técnicos tanto de forma escrita como oral. Competencias alineadas: CA1, CA5, CA6, M03CM05, CT3

Theoretical and Practical Contents

* OBSERVE: THIS COURSE IS SET AS AN English Friendly Course (EFC): Spanish is the teaching-medium.

Introduction to Data Mining: Goal. Applications. Approaches: Classification, Association, Clustering. Data and datasources. Pre-processing. Feature selection. Data imbalance.

Clustering: Signal compression. Approaches: k-means, hierarchical, agglomerative. Applications (e.g. homes, species, customer trends).

Predictive models: Inference algorithms: neural networks, bayesian networks, random forest, logistic regression etc. Evaluation metrics (e.g. confusion matrix, precision, recall, f-score, AUC). Ensemble models. Multi-class mono-label vs. multi-class multi-label prediction models. Real tasks and international research challenges. Applications: clinical diagnoses.

INTRODUCCIÓN:

· Objetivo. Contexto de aplicación.

· Aplicaciones comerciales: propensión/scoring, retención, venta cruzada, sistemas web, pronóstico y diagnóstico médico, aplicaciones industriales, procesamiento del lenguaje natural.

- · Inteligencia artificial. Aprendizaje automático. Reconocimiento de formas.
- · Aproximaciones a la minería de datos: Clasificación, Asociación, Clustering
- · Datos: Recopilación de datos. Análisis.

• Pre-procesamiento: Selección de atributos. Introducción a los heurísticos de búsqueda y los algoritmos genéticos. Desbalance o cómo aprender con pocos datos.

TÉCNICAS EXPLORATORIAS: CLUSTERING

- · Clasificación no-supervisada (clustering)
- Estudio de técnicas de clustering: clustering particional (k-means clustering); clustering probabilístico (algoritmo EM); clustering jerárquico (algoritmo aglomerativo); redes neuronales.

• Aplicaciones: Compresión de señal y teoría de la información; tendencias de clientes; detección de especies; mapa socio-lingüístico; web mining en artículos.

TÉCNICAS PREDICTIVAS: CLASIFICACIÓN

· Técnicas de evaluación y validación de clasificación supervisada

Algoritmos de inferencia: neural networks, bayesian networks, random forest, logistic regression · Combinación de clasificadores: meta-clasificadores (ensembles)

- · Modelos multi-class mono-label vs. multi-class multi-label
- · Aplicaciones: business intelligence, diagnóstico clínico

TEACHING METHODS

* OBSERVE: THIS COURSE IS SET AS AN English Friendly Course (EFC): Spanish is the teaching-medium.

The approach is mainly practical, the classes are taken in the lab. Programming labs are carried out and presented in groups. By the end of the course a research-style poster is presented covering a related article or a self-implemented application.

La asignatura es presencial.

La asignatura se desarrolla mediante tres tipos principales de actividades: clases magistrales de teoría, sesiones prácticas de ordenador y de trabajo y discusión. Todas las actividades requiren actitud pro-activa y pensamiento crítico. Se fomentan metodologías activas de enseñanza-aprendizaje.

Grupo de Ordenador: tienen como objetivo implementar en sistemas reales las técnicas trabajadas en las clases magistrales. Para adquirir diversas capacidades se fomenta el trabajo en equipo cooperativo y también se asume trabajo autónomo.

OBSERVATIONS

ENGLISH FRIENDLY COURSE (EFC):

Spanish is the teaching-medium.

Both the lectures and the main teaching-material are in Spanish.

However, student-interventions in English are welcome in class.

The lecturers are willing to tutor, conduct examinations and/or accept results, works and e-mails in English.

The course aims at international students with either a good command of Spanish or a medium level of Spanish and good command of English.

Degree GII3S130 - Bachelor's Degree in Computer Engineering in Management and Ir Year Fourth year DURSE 27712 - Advanced Software Design Credits, ECTS: 6 DURSE DESCRIPTION Most of the software design and development techniques seen in the first three years of the degree are applied to built desktop or web applications, by translatir the skills they galready have into a new framework: the Android development environment. In order to take this module, students should previously know: • Object-oriented programming using Java or a similar programming language • Relational database design and SQL. • Working in groups OMPETENCIES/LEARNING RESULTS FOR THE SUBJECT On completion of the module a student should be able to: • Understand the importance of design as a part of the software development process • Understand and use third-party software libraries • Vorking in groups OMPETENCIES/LEARNING RESULTS FOR THE SUBJECT On completion of the module a student should be able to: • Understand and use software design part terms correctly as part of the software development process • Understand and use software design part terms correctly as part of the software development process • Understand and develop web-service oriented architectures • Understand and develop web-service oriented architectures • Understand software development • Software development • Sorotice and Dracctcal Contents This module is and		DE 2023/24

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Students can choose between two methods of assessment: continuous and final.

Students who choose continuous assessment will get their grade based on three tasks:

- 2 individual projects, each project corresponds to 30% of the final grade. Practical projects consist of the implementation a mobile application that meets certain requirements.

- Group project, 40% of the final grade. Development of a project in a group of 2 or 3 students. Students can choose to use several tool/technique presented in the module.

Students who choose final assessment will get their grade based on a single practical exam at the end of the module.

For more information about the assessment method, get in touch with the teaching staff.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

For more information about the assessment method, get in touch with the teaching staff.

MANDATORY MATERIALS

All the necessary material will be available at the university's eGela platform.

TEACHING METHODS

In this subject, various active teaching methodologies are used, trying to develop collaborative learning based on projects, at least in practical classes, promoting autonomous work, through the use of computer and bibliographic resources that help students to understand the different aspects of the subject.

In the lecture modality, brief presentations will be given by the teacher, dedicating most of the face-to-face time to carrying out various activities, generally working in groups, and sometimes, carrying out some individual activity. In order for the students to materialize the learning outcomes, various exercises will be proposed, both individually and in groups, and they will be asked to develop an engineering project, along with the necessary technical documentation, which must be presented in a final document. Likewise, they must carry out a work plan, follow-up and control of said project.

Evaluation methods

Legend:

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 60%

TA: Workshop

- Exercises, cases or problem sets 20%
- Teamwork assignments (problem solving, Project design) 20%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A mixed evaluation will be carried out, combining the exam grade with the continuous evaluation of the student's work and the skills worked on (individual and in group, face-to-face and non-face-to-face) weighing the following aspects or tasks:

1. REALIZATION OF PRACTICES (Exercises, Cases, Problems...) 20%

2. TEAMWORK (Problem resolution, Project design...) 20%

3. WRITTEN TEST 60% (Exclusive condition: students must pass this exam, to opt for the pass of The subject)

All proposed deliverables, both individually and as a team, are required for continuous evaluation and will be subject to continuous evaluation. To be qualified it is necessary to have delivered them, in the form and on the dates proposed by the teacher. In order not to undermine the principles of continuous assessment and competency-based teaching, students who have not delivered the deliverables on time will not have the opportunity to deliver them later.

According to Article 8.3 of the regulations governing the evaluation of students in official bachelor's degrees, the student who submits in writing to the teaching staff responsible for the subject the waiver of continuous evaluation, within a period of 9 weeks from the beginning of the semester, you will have the right to be evaluated through the final evaluation system, regardless of whether or not you have participated in the continuous evaluation system.

FINAL EXAM

In the event that the student chooses to present himself through the final evaluation option, his grade will consist of: - Written test (60%)

- Laboratory Practice Test (40%).

To pass the subject it is necessary to obtain a grade of more than 50% in each of them, and each of them may include content or exercises related to the entire program developed in class throughout the course.

However, according to Article 12.2 of the Student Assessment Regulations in official Bachelor's degrees:

"In the case of continuous evaluation, if the weight of the final test is greater than 40% (in the case of this subject) of the qualification of the subject, it will suffice to not appear for said final test so that the final qualification of the subject is not presented or not presented. Otherwise, if the weight of the final test is equal to or less than 40% of the course grade, the

student may withdraw from the call within a period that, at least, will be up to one month before the end date. of the teaching period of the corresponding subject. This resignation must be submitted in writing to the faculty responsible for the subject. In the case of final evaluation, failure to appear for the test set on the official exam date will mean automatic resignation from the call."

In all written tests, students must identify themselves by means of their academic card, DNI or driving license and may only use the basic drawing utensils, consisting of: ruler, square and bevel, compass, pencils, markers and erasers. Not being allowed to have within reach: backpacks, books, notes, telephones, calculators, or any other type of electronic device. At the beginning of the tests they will be told where they must leave all the objects not allowed, being considered a serious offense the possession of the same during the tests.

In the event that health conditions prevent the performance of a teaching activity and/or face-to-face evaluation, a non-face-to-face modality will be activated, of which the students will be promptly informed.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

According to Article 9.2 of the regulations governing the evaluation of students in official degree degrees, the evaluation of the subject in the extraordinary call will be carried out exclusively through the final evaluation system. Your qualification will consist of a single:

- Written test (60%)

- Laboratory Practice Test (40%).

In all written tests, students must identify themselves by means of their academic card, DNI or driving license and may only use the basic drawing utensils, consisting of: ruler, square and bevel, compass, pencils, markers and erasers. Not being allowed to have within reach: backpacks, books, notes, telephones, calculators, or any other type of electronic device. At the beginning of the tests they will be told where they must leave all the objects not allowed, being considered a serious offense the possession of the same during the tests.

In the event that health conditions prevent the performance of a teaching activity and/or face-to-face evaluation, a non-face-to-face modality will be activated, of which the students will be promptly informed.

Internal forces. Concept of stress. Field of stresses. Main stresses. Graphic representation of the tensioner of stresses. Circles of Mohr. Special stress states.

Universidad Euskal Herriko del País Vasco Unibertistatea

3. General theory of deformation.

Hooke's law for a state of uniaxial tensile. Deformations due to shear stresses. Hooke's Law in shear. Hooke's law for flat stress and triaxial state of stresses. Deformation matrix. Circle of Mohr for flat deformation.

4. The elastic problem.

Flat elasticity. State of flat deformation. Flat stress state. Circle of Mohr.

5. The elastic solid.

Constitutive equations. The tensile test. Linear elasticity and Hooke's law. Shear stress and angular deformation. Generalized Hooke's Law. Deformations and stresses of thermal origin.

6. Failure theories.

Failure theories. Equivalent stress. Criterion of the maximum main stress or Rankine's criterion. Theory of maximum unit deformation or Saint-Venant's criterion. Theory of maximum tangential stress or Tresca's criterion. Theory of distortion energy (von Mises' criterion). Mohr's criterion.

7. Introduction to the Strength of Materials.

The prismatic piece. Internal forces and deformations; Navier's hypothesis. Isostatic beams and hyper-static beams. Diagrams of efforts.

8. Simple axial effort.

Tensile or compression simple stress state. Deformations in tensile or simple compression. Hyper-static structures. Effect of temperature and deformations or previous stresses.

9. General theory of bending. Stresses.

Normal deformations in beams. Normal stresses in beams. Types of beam sections. Shear stresses in rectangular beams. Shear stresses in double-T beams with wide wings. Shear stresses in circular beams. Compound beams. Beams with axial loads. Asymmetric bending.

10. General theory of bending. Deformations.

The elastic curve. Moment area method: Mohr's theorems. Application of the superposition principle.

11. Hyper-static bending.

Degree of hyper-staticity and static redundancy. General procedure using Mohr's theorems. General procedure using the differential equation of the elastic. Equation of the three moments. Singular cases in the equation of the three moments. Introduction to the study of rigid knot structures.

12. Theory of torsion.

Torsion in circular bars. Non-uniform torsion. Pure shear. Relationship between the modulus of elasticity E and G. Power transmission on axes. Bending and torsion combined in circular axes. Statically indeterminate axes in torsion.

13. Instability: Buckling.

Critical load. Euler's formulas. Anchorage conditions in columns. Field of application of Euler's formula.

TEACHING METHODS

The lectures will be expository and will develop the concepts and theoretical contents necessary to overcome successfully the subject. Model exercises will also be presented by the teacher.

The seminars are fundamental, given the applied nature of the subject; in them, students should work on problems of practical application. In these classes, group work and active participation of the students will be encouraged.

In case that sanitary conditions prevent the performance of any of the teaching activities and / or face-to-face assessment, a non-face-to-face modality would be activated of which the students would be informed promptly.

TYPES OF TEACHING

	Types of teaching	Μ	S	GA	GL	GO	GCL	ТА	TI	GCA

Evaluation methods

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 80%
- Exercises, cases or problem sets 20%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation of the competences will be done through two partial exams and/or a final exam, which will represent 70% of the final grade in the subject. The remaining 30% will comprise the note of the deliverables that will be developed throughout the semester. In total, exam and deliverables, it must be obtained an average grade higher than 5.0 in order to be considered the subject as approved.

Throughout the semester, there will be two partial exams, which will allow to free final exam, both in the ordinary and in the extraordinary call, the passed part. In these partial exams, it must be achieved at least 40% of the maximum grade, in order to maintain the qualification and make the average with the part evaluated in the final exam, which must also reach at least 40% of the maximum grade of the part evaluated.

During the semester, various deliverables will be evaluated, in which a minimum score of 40% must be achieved (in each of them) of the maximum grade to be considered as surpassed. There will be three opportunities to overcome these deliverables (during the semester, ordinary and extraordinary calls).

The student will be qualified in any the ordinary and the extraordinary calls if he / she attends any of the final exams in these calls.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The final evaluation in this call will also be divided into a test that will represent 70% of the grade and in three deliverables with a percentage of 30% (in both parts a minimum qualification of 40% of the maximum note). In total, exam and deliverables, the students must obtain an average grade higher than 5.0 to be able to consider the subject as approved.

OBSERVATIONS

COURSE GUIDE 2023/24	
Faculty 363 - Faculty of Engineering - Bilbao	Cycle .
Degree GMECAN30 - Bachelor's Degree in Mechanical Engineering	Year Third year
COURSE	
27724 - Machine Design	Credits, ECTS: 9
COURSE DESCRIPTION	

The subject of Machine Design is a compulsory subject of the third year of the Mechanical Engineering Degree. Its purpose is to provide the concepts, procedures and decision analysis techniques required for the mechanical design of various machine elements. In this sense, the mechanical engineer faces in his professional life many situations in which he must design, analyze, interpret failures, redesign, maintain or/and select different machine elements efficiently. This process requires considering throughput specifications or the performance of each element at the individual level, as well as the interfaces between these elements as part of a machine.

The understanding and practical application of the design theories and methodologies explained in this subject requires previous knowledge acquired in the subjects of Applied Mechanics and Elasticity and Strength of Materials. It is more than advisable (not to say practically mandatory) to have passed these subjects, since the subject of Machine Design takes as a starting point the concepts acquired in these subjects. In addition, although it is not essential, it is also advisable to have passed the subject of Machine Kinematics and Dynamics.

COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT

To know, understand and apply the fundamentals of Machine Design, in such a way that they enable students to apply advanced methods and theories in their professional development in areas of Mechanical Engineering. This skill will also provide them with great versatility to adapt to new situations.

To apply properly the strategies of the scientific methodology: analyze the problem situation qualitatively and quantitatively, propose hypotheses and solutions for solving typical problems of Machine Design, in the field of Mechanical Engineering., and finally, to understand and interpret the results.

To express correctly, using the appropriate means, the theoretical knowledge, resolution methods, results and inherent aspects of the propounded problems by the calculation, construction and testing of machines, within Mechanical Engineering, using the specific vocabulary and terminology of the subject.

To work effectively in a team, integrating skills and knowledge to formulate ideas, discuss proposals and adopt decisions in the development of own works of Machine Design and within the field of Mechanical Engineering.

To develop designs, projects and processes in the field of Machine Design, and within the field of Mechanical Engineering. As well as making measurements, calculations, studies, reports and other similar work, related to problematic situations to sort out in the field of the specialty.

To know, understand, interpret and apply the legislation correctly, specifications, regulations and mandatory standards in Machine Design, within the field of Mechanical Engineering.

Theoretical and Practical Contents

The theoretical-practical contents taught in Machine Design classify into the following main sections:

Chapter I: a logical and unified introduction to Machine Design.

Chapter II: the study of the behavior of materials under static stresses: stress concentrations, failure theories and fracture mechanics.

Chapter III: explains the classic methods of analysis of materials under variable loads of fatigue, both in the case of uniaxial and multiaxial stresses.

Chapter IV: given its current wide use in the field of mechanical design, a brief overview of the Finite Element Method in the mechanical computer design is given.

Chapter V: applying the knowledge acquired in the previous chapters, as well as in previous subjects of the Degree, this chapter addresses the design of the main elements of machines widely used in mechanical engineering, such as shaft, clutches, brakes, belts, bearings, screwed joints, etc.

TEACHING METHODS

This subject has master classes and seminars.

In the master classes, the professor will explain the theoretical concepts of the different chapters of the subject. To follow the class, the student will have reference books (in English), a course book (in Spanish) and some PowerPoint presentations (pdf files) in Spanish. These PowerPoint presentations are a summary of the course book, prepared so that the student can follow the explanations of the professor and take notes. Occasionally there will be exercises/activities to strengthen the theoretical concepts, trying to encourage the participation of the student.

In the seminars, the professor will propose and solve the exercises corresponding to the content explained in the lectures. He/she will encourage each student to solve each exercise individually before the seminar, and that he/she discusses with the other students and the professor the proposed solution. In this way, the student will assimilate better the concepts of each exercise and will acquire skills related to oral communication, the ability to synthesize and teamwork.

On the other hand, in the seminars the teacher will propose each week an exercise/activity that the students (in groups of 2 to 4 students) will have to solve and deliver trough the eGela platform. The objective of this weekly group work is to

perform a continuous assessment of the student (the qualification of these group assignments will count towards the final grade of the subject), as well as to enhance their ability to work in groups.

Written test, open questions 70%

- Teamwork assignments (problem solving, Project design) 30%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation of the subject in the ordinary call will be carried out through the CONTINUOUS assessment system by means of the following evaluation activities:

1. DELIVERABLES: Throughout the course, students must perform individual and / or group work in which the knowledge acquired in the subject (hereinafter deliverable) is applied. Each deliverable will consist in the resolution of proposed exercises or complementary activities proposed weekly, and that the professor will guide in the seminars, tutorials ... Each individual / group will have to deliver each week the exercise / activity proposed the previous week, realizing in this way a continued monitoring of the course. The weight of the note of the deliverables on the final grade of the subject is 30%. Any deliverable that does not meet the requirements established by the teaching staff in terms of delivery time and medium, content and clarity / readability, will obtain a score of 0 out of 10.

2. 1st PARTIAL + 2nd PARTIAL: Once the first 8 lessons had been taught, a non-obligatory individual theoretical-practical partial examination will be carried out (during the 7th or 8th week of the term). Students, who wish to, may take the first partial exam to evaluate the content corresponding to the first 8 lessons. The weight of the note of the 1st partial on the final grade of the subject is 35%. In order to assist the partial exam, it will be mandatory requirement:
 2.1. Obtain a grade of PASSED on the deliverables related to the first 8 subject-matters.

2.2. Students who pass this first partial exam will have passed the first part of the subject and may take the final exam only with the subject corresponding to the last 7 lessons. The weight of the partial exam grade will be 35%. The minimum requirement for the achievement of the mean between the scores of each of the exercises that is composed each of the exams, is to obtain a minimum score of 2/10. Those students who have passed the first partial exam and want to take only the second partial, must obtain a grade of PASSED on the deliverables related to the last 7 subject-matters.

3. ORDINARY FINAL EXAM: for students who have not passed the first partial or have not submitted to it, at the end of the course, a final theoretical-practical individual exam will be held. The weight of the individual exam grade on the final grade of the subject is 70%. The minimum requirement for the achievement of the mean between the scores of each of the exercises that is composed each of the exams, is to obtain a minimum score of 2/10. The rest 30% will be related to the deliverables and to obtain a grade of PASSED is mandatory.

Therefore, to pass the subject in ordinary call it is necessary to pass independently both the individual exam (each partial exam: 1st partial and 2nd partial, or only the final one) and the deliverables.

For those students who EXPRESSLY RESIGNATE THE CONTINUOUS ASSESSMENT by email to the professor before the 9th week of the course (according to Official regulations governing the Students Assessment in undergraduate degrees of UPV / EHU), the subject evaluation In the ordinary call, it will be carried out through the FINAL evaluation system through the following assessment activity:

1. FINAL written exam. This exam will contain an additional exercise that includes the evaluation of the skills associated to the deliverables.

The minimum requirement for the achievement of the mean between the scores of each of the exercises that is composed each of the exams, is to obtain a minimum score of 2/10.

The exchange students who wish to carry out the evaluation tests in English must expressly request it at the beginning of

the course.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The evaluation of the subject in the supplementary call will be carried out through the FINAL assessment system by means of the following evaluation activities:

1. FINAL written exam.

The minimum requirement for the achievement of the mean between the scores of each of the exercises that is composed each of the exams, is to obtain a minimum score of 2/10.

The exchange students who wish to carry out the evaluation tests in English must expressly request it at the beginning of the course.

OBSERVATIONS

• CONTINUOUS ASSESSMENT SYSTEM

• Qualification percentages:

o Written exam (%): 70

o Teamwork (problem solving, activities, design project) (%): 30

In the case that health conditions do not allow:

- Carrying out a face-to-face teaching activity, a non-face-to-face modality will be activated of which the students will be informed promptly.

- Carry out the face-to-face exams, other evaluation methods will apply through eGela. In general, they could consist of the following elements: deliverables, questionnaires, tasks and oral test.

The theoretical contents:

1- Philosophy and field of application of computational fluid dynamics.

2- Equations that govern the flow: continuity, momentum and energy.

3- Mathematical considerations of differential equations. Generalities. Differential equations: hyperbolic, parabolic and elliptical. Simplifications of the Navier-Stokes equation.

4- Preliminary discretization techniques. Discretization. Approximation of the derivatives. Accuracy of the discretization process. Implicit and explicit approach. Theoretical framework: convergence, stability, accuracy of the solution.

5- Brief notes on the theory of similarity. Physical meaning of the dimensionless numbers.

6- Turbulent flow. Reynolds equations averaged over time. Equation models of turbulent kinetic energy. Boundary layer.

7- Basic computational methods applied to incompressible flow. Resolution of the transport equation. Methods to solve the current function. Boundary conditions. Methods to solve the pressure-velocity equation.

8- Basic computational methods applied to compressible flow. Methods for the numerical treatment of shock waves.

9- Generation of meshes and adequate transformations of the equations

10- Multiphase flow. Eulerian and Lagrangian approximation. VOF method (volume of Fluid)

The practical contents:

1- User-level learning of a commercial code of computational fluid dynamics.

2- Application of the theoretical concepts in practical exercises of computer simulation of real fluid mechanics problems. Comparison tests in laboratory vs. Simulation.

TEACHING METHODS

In this course, different teaching methodologies are used, the most used being problem solving. Individual and in couple work will be enhanced through the use of computer and bibliographic resources that help students understand the different

aspects of the subject.

Master lectures on the conceptual contents of the subject will be taught, with student participation in occasional debates about those contents.

The resolution of issues and problems in the classroom will be done in a participatory manner. Real problems will be provided, which will deepen the theoretical knowledge of the subject and relate the CFD with other related areas. The formulation of questions and open discussion will be encouraged, so that students acquire skills related to oral communication, the ability to synthesize and work in teams.

In computer practices, the concepts studied will be applied to real cases using a commercial program of Computational Fluid Dynamics.

To facilitate and ensure student learning, successive reports will be delivered on the problems raised. Evaluation feedback will be provided, so that students have the opportunity to become aware of their learning, as well as ways to improve it.

In the event that health conditions prevent the performance of a teaching activity and/or evaluation in person, a nonpresential modality will be activated of which the students will be informed punctually.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	15		30		15				
Horas de Actividad No Presencial del Alumno/a	22.5		45		22.5

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Exercises, cases or problem sets 10%
- Individual assignments 10%
- Teamwork assignments (problem solving, Project design) 80%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Students will be graded through a process of continuous assessment of the different tasks developed throughout the course as follows:

1. Practical work (Tutorials, Exercises): 10%

2. Deliverables of questions and small problems: 10%

3. Projects, problems and individual and group work. Directed tasks (works of greater complexity under the guidance of the teacher): 80%.

The following condition will apply: It is necessary to attend 80% of the classroom hours in order to be graded, otherwise it will be graded as "not presented".

In the event that health conditions prevent the completion of a teaching activity and/or face-to-face assessment, a nonface-to-face mode will be activated, of which students will be promptly informed.

Students who, at the beginning of the course, justify any of the reasons listed in article 43.1.c of the EHU/UPV regulations for the management of undergraduate studies, may obtain 100% of the mark by means of a theoretical-practical exam.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

For students who have taken part in the continuous assessment and have not passed the course, a final exam will be held in addition to the work done throughout the course.

For students who have NOT taken part in the continuous assessment, 100% of the mark may be obtained by means of a theoretical-practical exam. In these cases, it is necessary to contact the teacher at least one month before the date of the

exam.

In the event that health conditions prevent the completion of a teaching activity and/or face-to-face assessment, a nonclassroom mode will be activated, of which students will be promptly informed.

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Alternative 1

Continuous assessment through two examinations and one laboratory report. First examination weights 60 %, second examination weights 32 % and laboratory report weights 8% of the course score.

Contents of the examinations: theoretical questions (40%), either multiple choice questions or short-answer questions, and exercises (60%).

Both examinations and laboratory report are compulsory. In the second examination, minimum score is 3.0.

According to the article 8.3 of the Assessment Regulations, students will have the right to be assessed through a final examination, regardless of whether he/she has taken part in the continuous assessment. Students will have to submit the renouncement to the continuous assessment to the professor in charge of the course along the first nine weeks of the semester.

In addition, according to the article 12.1 of the Assessment Regulations, if the student has taken part in the continuous assessment, he/she may renounce this assessment up to one month before the end of period of teaching. The renouncement must be submitted in written form to the professor in charge of the course.

Alternative 2

Global examination containing theoretical questions (40%), either multiple choice questions or short-answer questions, and exercises (60%).

It is accepted that those students who have not attended the examination are renouncing the assessment.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Global examination containing theoretical questions (40%), either multiple choice questions or short-answer questions, and exercises (60%).

It is accepted that those students who have not attended the examination are renouncing the assessment.

TEACHING METHODS

The course will be delivered by means of:

- Lectures (MC), which will be used to explain core contents in order to develop students' knowledge and understanding of these concepts.
- Classroom practices (CP), which will be used to solve practical activities, problems, etc.
- Practice in the field (FP), which will be used to visit industrial facilities.

If the health situation avoids the development of any teaching or evaluation activity, a non-presential alternative will be used and the students will be promptly informed.

TYPES OF TEACHING

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

CONTINUOUS ASSESSMENT is used in both ordinary and extraordinary sessions.

Written exams comprising theory and problems (multiple choice test, theoretical questions and exercises)

- Three mid-term exams (eliminatory for students with a minimum grade of 5.0/10 and passing at least two or more midterm exams).

- A final exam, if the student does not pass two or more mid-term exams: 80 % (mid-term exam of one part, with its corresponding grade).

- Practical face-to-face activities: 12 %

- Practice in the field: 8 %

Notes:

Students will withdraw from the ordinary session by default if they do not take the ordinary final exam. Any student wishing to waive continuous evaluation and wishing to be marked by FINAL ASSESSMENT instead by continuous assessment in the ordinary session should request this in a written document from the lecturer responsible for the course before the ninth week after the course starts.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

There are two options:

1) CONTINUOUS ASSESSMENT. This is the default option; students are assessed by means of:

- Final exam: 80%
- Practical activities: 12%
- Practice in the field: 8%

2) FINAL ASSESSMENT, for any student wishing to waive continuous evaluation (see section 6.2). Students are required to take a single exam (100% of the mark), comprising all the concepts and skills covered throughout the course.

MANDATORY MATERIALS

Materials required to follow the sessions will be shared with the students though eGela virtual platform:

- Lecture materials and documents,

- Problems' wordings and instructions for practical activities.
- Links to useful websites and reports.

OBSERVATIONS

Conditions and clarifications:

If the health situation avoids the development of any evaluation activity, a non-presential alternative will be used and the students will be promptly informed.

1.- Any student that passes the three mid-term exams will be exempt to take the final exam (average grade of 5.0/10),

with the exception of those students who not pass practical activities and practice in the field or if the final grade is < 5,0. 2.- The mark obtained in practical activities and in practice in the field will be considered if the student:

- Passes all mid-term exams and he/she is exempt to take the final exam.

- Does not pass one of the mid-term exams, but the grade of the failed part is >=4,0.

- Does not pass the final exam, but her/his grade is >=4,0.

3.- The mark obtained in the practice in the field will be carried over for two academic years.

4.- Any student assumes to obey academic regulation and to take "Environmental Engineering" course with an ethical behaviour and honesty. Hence, plagiarizing exams or activities will be strongly penalized and may lead to fail the course.

Universidad Euskal Herriko del Pais Vasco Unibertsitatea

- Traffic analyses
- 3. Capacity, levels of service and road planning
- Capacity and levels of services
- Road planning
- 4. Horizontal alignment
- Road geometry regulations. Velocity and sight distance
- Straights and curves
- Transition curves (clothoids) and grade transitions
- 5. Vertical alignment
- Grades and vertical curves
- Vertical curves
- Coordination of horizontal and vertical alignment
- 6. Transverse sections and representation on drawings
- Transverse section
- Representation on drawings
- 7. Crossroads
- General design considerations
- Elements and distances
- Intersections
- Interchanges
- Roundabouts
- Selection of crossroad type
- 8. Earthworks. Platforms. Use and protection of the roadway
- Earthworks and mass-diagram
- Use and protection of the roadway
- Construction of more sustainable roads
- 9. Surface and subterranean drainage
- Surface drainage
- Subterranean drainage
- 10. Soil classifications. Tests. Subgrades. Granular and cement-treated bases. PG-3
- Soil and rock mass classifications
- Compaction and subgrade strength tests
- Soil stabilization
- Granular layers
- Cement-treated bases
- PG-3 regulations
- Sustainable materials in subgrades and in bases.
- 11. Bituminous pavements
- Bituminous binders
- Bituminous mixes
- Surface treatments
- Execution of bituminous pavements
- Sustainable materials in bituminous materials
- 12. Concrete pavements
- Main concrete pavements
- Execution
- 13. Surface characteristics of bases. Pavement design
- Surface characteristics of pavements. Roughness and skid resistance
- "Norma 6.1-IC Secciones de firmes" standard
- Standard for pavement design of the Basque Country
- 14. Road maintenance
- Road maintenance and management
- Remedial maintenance techniques
- Pavement recycling
- 15. Airport infrastructure. Airport pavements
- Airport infrastructure
- Airport pavements

Railways, bridges and tunnels (2. Semester)

- 16. The context of the railway
- 17. Geometry of the railway line
- Introduction to the railway structure
- Horizontal alignment

- Vertical alignment. Grade in curves
- 18. The rail
- Characteristic of the steel
- Rail wear
- Short bar and Long Welded Bar
- Welding
- 19. Rail fastenings
- 20. Sleepers
- Timber sleepers
- Steel sleepers
- Concrete sleepers
- 21. Track ballast
- Ballast and sub-ballast
- Subgrade layers
- 22. Joints
- 23. Rail distressing
- 24. Track devices
- Crossover
- Bretelle
- 25. Rail machinery
- Main rail machinery
- Light rail machinery
- 26. Railway renewal
- Track renewal
- New tracking
- 27. Track qualification
- 1st and 2nd levelling
- Verification of track geometric parameters
- 28. High Speed Train
- 29. Bridges
- 30. Tunnels
- Rock mass classifications
- Tunnelling methods: Tunnelling Boring Machines (TBM), roadheader, drill and blast
- Lining
- Special Works

TEACHING METHODS

In the theoretical lessons the theoretical concepts are developed.

In the practical lessons the theoretical concepts will be applied in problems according to the requirements indicated in the corresponding regulations.

More sustainable materials and technics for road construction are exposed for being applied in the project of the infrastructure

TYPES OF TEACHING

	GL: Applied laboratory-based grou	ips GC): Applie	d compu	ter-base	d groups	GCL:	Applied	clinical-b	based gro
	TA: Workshop	TI:	Industria	al worksh	пор		GCA:	Applied	fieldwor	k groups
valuation me	ethods ourse evaluation									
	ols and percentages of final	mark								
	st, open questions 60% k assignments (problem solvir	ng, Proj	ject de	sign) 4	10%					
RDINARY EX	CAMINATION PERIOD: GUID	DELINE	ES ANI		NG OU	Т				
WRITTEN B	EXAM (60 % of the mark)									
There will b	e an exam in each of the conv	vocatio	ns and	the ent	ire subi	ect will	he eva	luated		

In February, out of the official convocation of January, there will be a partial exam of the first part of the subject. This part will not be included in the ordinary convocation (May/June) if the mark is 6.0 or greater (>= 6.0/10.0). There will not be a partial exam of the second part. Only those with a mark of 6,0 or greater in the partial exam of February will do an exam about the second part of the subject (railways, bridges and tunnels). The rest of students will do a global exam.

In the extraordinary convocation the entire subject will be evaluated.

PRACTICAL PROJECT (40% of the mark)

During the practical lessons of the 2nd semester a project to be developed about a road will be presented. In this project, apart from the fulfillment of the standards for geometric design of the road and the design of the pavement section, it will be positively evaluated the employment of sustainable materials in the pavement structure, the recycling of some parts of the pavement, and the design of geometric layout with the mínimum environmental impact.

It has to be finished in the 29th week.

In order to pass the subject, both parts, the written exam and the practical project, must have a mark of 5.0 or over out 10.0.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

WRITTEN EXAM (60% of the mark)

In the extraordinary convocation the entire subject will be evaluated.

PRACTICAL PROJECT (40% of the mark)

In case of not passing the practical project in the ordinary convocation, it can be given in the date of the exam of the extraordinary convocation, with the corrections included according to the professor's suggestions.

In order to pass the subject, both parts, the written exam and the practical project, must have a mark of 5.0 or over out 10.0.

MANDATORY MATERIALS

Manuals:

Sections 1, 2 and 3

Heriberto Pérez Acebo (2018) CARRETERAS. Volumen I: Red viaria y tráfico. Servicio Editorial Universidad del País Vasco UPV/EHU

Sections 4, 5, 6 and 7

Heriberto Pérez Acebo (2016) CARRETERAS. Volumen II: Trazado. Servicio Editorial Universidad del País Vasco UPV/EHU.

Section 30

Javier Gallo Laya, Heriberto Pérez Acebo, David García Bragado. (2016) Excavación, sostenimiento y técnicas de corrección de túneles, obras subterráneas y labores mineras. Servicio Editorial Universidad del País Vasco UPV/EHU.

Rest of sections: • Notes of the subject • Indicated regulations and laws • Articles from scientific journals about sustainable materials in roads
