ENGLISH FRIENDLY COURSES (EFC) 2023-2024 CAMPUS OF GIPUZKOA

https://www.ehu.eus/es/web/informatika-fakultatea/incoming_students Coordinator: informatica.internacional@ehu.eus

In addition to the general offer of courses taught in English, some Centers offer for incoming students English Friendly Courses (EFC): subjects taught in Spanish or Basque, in which the syllabus summary; lecturer tutoring, examinations and/or papers are available in English.

English Friendly Courses taught in SPANISH:

3.2.-Shared memory machines: synchronization and load balancing.

3.3.-Programming multiprocessors: OpenMP.

3.4.-Development of a parallel application.

BASIC CONCEPTS OF C PROGRAMMING LANGUAGE

TEACHING METHODS

The first two topics of the subject will be taught using two types of classroom activities: master classes and exercise (practical) classes. Both of them will be performed in an active and collaborative way.

The third topic will combine master classes and exercise (practical) classes with laboratory sessions. A practical work, a functional software module and a report about the work carried out in groups will be compulsory in this topic to pass the subject.

Evaluation methods

- Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Percentages and assessed parts are specified in next section 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The subject has two assessment options: the final assessment and the continuous assessment.

a) Continuous assessment. This is the predetermined option and can only be used in the ordinary call. Active and continuous participation of the students is required: coming to contact lessons and laboratories, assignment and class work delivery, participating in assessment activities, practical works and presentations. When these conditions are not fulfilled the students will be assessed in final assessment.

The continuous assessment will be: written exams (72,5%), assignments (5%) and practical work (22,5%). In both the written exams and the practical work, the minimum mark required is 4 points.

In order to resign to the call, it is enough not to take the exam of the last topic.

b) Final assessment. This will be the option when the student is not in continuous assessment: written exam (80%) and practical work (20%). To pass the subject it is necessary to obtain at least 4 points in both the written exam and the practical work.

In order to resign to the call, it is enough not to take the final exam.

Students who, having fulfilled the conditions for being in the continuous assessment system, decide to opt for the global assessment, must inform via e-mail the lecturers responsible for the subject at the latest after the assessment of the second continuous assessment exam.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The only option for the extraordinary call will be final assessment.

 Organization of the file system. Namespaces, directories
 I/O "Buffering": libraries functions vs. system calls
- Advanced access to device properties

- System calls for I/O and C standard library functions
- Exercises on I/O and lab work

Unit 4: User management and security

- Multi-user systems
- Protection mechanisms
- Security-related system calls
- Exercises on user management and securiry and lab work

Unit 5: Memory management

- Loading and placement of programs in systems with one or more programs in memory
- Support for virtual memory systems: physical and virtual addressing
- Static and dynamic relocation. Reentrant code
- Static and Dynamic link libraries
- Calls to the operating system related to program loading and memory management
- Compilation practices, memory management, static and dynamic link libraries, and program loading

Unit 6: Process control

- Concept of execution flow and context. Context switching
- Multiprogrammed and multithreaded systems
- Concept of process (Unix model), states and transition graph
- Processes' scheduling and basic scheduling policies
- System calls and library functions related to process and thread control

- Practical work: process execution in background from the Shell, process monitoring, simple and multprogrammed shell, multithreaded examples

Unit 7: Communication and synchronization between processes and threads

- Concepts of concurrency, shared resource, race condition and exclusive access
- Critical sections of code. Basic mechanisms for exclusive access to critical sections
- Communication with message passing through mailboxes. Communication and synchronization via threads
- System calls related to communication and synchronization between processes and threads
- Resource management model based on the client-server scheme. Examples of resource managers (drivers)
- Practical work: communication and synchronization between processes (using pipes) and threads

TEACHING METHODS

This course is based on the functional vision of operating systems and the application programming interface (API). Therefore, although always based on the theoretical concepts that support it, it will have a large practical component. For this, various teaching methodologies will be used, from master classes to more active methodologies such as PBL (Project Based Learning) or pBL (Problem Based Learning) and laboratory activities.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	ТА	TI	GCA
Hours of face-to-face teaching	40			20					
Horas de Actividad No Presencial del Alumno/a	50			40

 GL: Applied laboratory-based groups
 GO: Applied computer-based groups
 GCL: Applied clinical-based groups

 TA: Workshop
 TI: Industrial workshop
 GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- The percentages and types of evaluation are specified in the following sections. 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

CONTINUOUS ASSESSMENT

The evaluation systems that are contemplated are the continuous evaluation system and the final evaluation system. The continuous assessment system is the one that will be used preferably, as indicated in the current regulations of the UPV/EHU. The student who, fulfilling the conditions to continue in the continuous evaluation system, decides to opt for the final evaluation, must inform the teacher(s) within the terms and manner indicated below: via eGela, through the corresponding link in the evaluation section, at the latest two days after knowing the results of the second partial exam.

- Individual evaluation questionnaires: 60%

- Practical Works: report with the developed code, specifications, verification results of the practice proposals and interview: 30%

- (Others) Specific individual assessment questionnaires on the work carried out: 10%

To pass the subject it is necessary that the student:

- Completes and submits all assessment tests
- Gets at least 40% of the evaluation of each of the tests
- The final average mark with all the evaluation tests is at least 5 out of 10

FINAL EVALUATION

For those who do not follow the continuous evaluation, the following evaluation mechanism is foreseen:

- Final individual written test (theoretical questions, practical exercises, code analysis, design/programming of utilities...): 80%

- The realization and delivery of a practical work and an interview about it: 20%

To pass the subject it is necessary that each student:

- Completes and submits all assessment tests
- Gets at least 40% of the evaluation of each of the tests
- The final average grade with all the tests is at least 5 out of 10

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the extraordinary call evaluation will be similar to the final evaluation of the ordinary call:

- Final individual written test (theoretical questions, practical exercises, code analysis, design/programming of utilities...): 80%

- The realization and delivery of a practical work and an interview about it: 20%

To pass the subject it is necessary that each student:

- Completes and submits all assessment tests
- Gets at least 40% of the evaluation of each of the tests
- The final average grade with all the tests is at least 5 out of 10

MANDATORY MATERIALS

Subject eGela online classroom, Linux operating system (there will be access to Linux through a server), manuals, tools and C programs that will be provided through eGela (Moodle service from UPV/EHU).

global evaluation as explained before.

In the case of overall evaluation, the student has to take a written exam that represents 100% of the final mark. To waive the call it is enough not to take the exam.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In this case the student must be evaluated by the overall evaluation. Its conditions are those described for the ordinary call.

The course is mainly focused on continuous assessment.

Continuous assessment will be evaluated by means of three written exams, with a weight of 30, 40 and 20% of the overall grade of the subject. Besides, a 10% of the grade will be determined by laboratory work.

Additionally, a minimum of a 30% grade must be achieved in each written exam and a minimum of 5 over 10 is required to pass the subject.

Final Assessment

This kind of assessment will be applicable to students who do not wish to take part in continuous assessment or those who do not meet the criteria continuous assessment.

In this case, a single written exam about the 100% of the subject must be performed. It will be carried out according to the official examination schedule of the Faculty. The minimum grade required in the final exam will be 5 out of 10.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

One single written exam about 100% of the subject in which the minimum grade is 5 out of 10.

6. Combination of classifiers

Study of the different techniques used to combine classifiers. The virtues of the consensus reached by classifiers will be highlighted.

7. Techniques for selecting variables

Study of basic concepts and techniques, both from the univariate and the multivariate points of view. Applications of this type of techniques: most important genes in an illness (a new area of bioinformatics).

8. Non-supervised classification (clustering)

Main clustering techniques. Describing the characteristics of this type of problem, differentiating them from the supervised ones. Practical examples: image segmentation, groups of foodstuffs based on their nutritional characteristics, segmentation of customers and targeted marketing and advertising.

9. Introduction to heuristic searches and genetic algorithms

Study of the best-known search technique: genetic algorithms. Usefulness in solving problems of selection of variables. Practical examples: design problems (aircraft, Meccano), composition of musical scores, travel agency problems.

10. Introduction to neural networks

Basic mechanisms of a neural network classification structure. Main neural network architectures. The subject is a motivation for a further course in the Faculty: "Machine Learning and Neural Networks"

TEACHING METHODS

Three lessons per week. One practical laboratory with computers (personal laptop, or provided by the Faculty), and two theoretical lessons.

TYPES OF TEACHING

GA: Applied classroom-based groups GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 60%

- Individual assignments 40%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A mid-exam, consisting of the 35% of the theoretical material (2'5 points of a total of 6), will be realized by mid-October. In case of having a sufficient mark in this exam, the final theoretical exam on January will only cover the 65% of the theory material (3'5 points of a total of 6). In this last January exam a minimum mark is needed to be able to pass the entire subject (1'5 points of a total of 3'5).

At least two deadlines will be announced to collect the practical laboratories developed by the student.

In order to pass the subject, it is needed to pass both parts: theory and practice.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

A final exam in January consisting in the 100% theoretical material. If the student has not delivered the practical laboratories during the weeks of the course, those must be delivered to the teacher one week before the final theoretical exam.

In order to pass the subject, it is needed to pass both parts: theory and practice.

MANDATORY MATERIALS

"egela" system is used to guide the "day-per-day" of the course: material of the theoretical lessons, as well as the

formulation of the practica-laboratory sessions.

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- Individual assignments 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In order to pass the subject in continuous assessment, students must carry out several individual practical assignments in the laboratory that test their knowledge of the tools and techniques addressed in class. The students will receive feedback on these works as the teacher corrects them, so that they are useful for learning.

NOTE: In case of return to confinement, the evaluation tests (both continuous and final) will be carried out electronically through questionnaires, interviews and / or deliveries of eGela and through the BBC connection.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The global evaluation consists of carrying out individual practical work in the laboratory that is equivalent to the set of works carried out during the course for continuous evaluation.

NOTE: In case of return to confinement, the evaluation tests will be carried out electronically through questionnaires, interviews and / or deliveries of eGela and through the BBC connection.

The assessment system for the subject offers two options: continuous assessment or exam and practical work -based assessment (final assessment).

1. Continuous assessment: based on one-off and regular attendance in class, presenting results, taking tests on the knowledge acquired and the performance of practical work (both individually and in groups). The grade is obtained from the following assessment results:

a. Development project (75% of the grade, compulsory): a project on the construction of a usable interface, throughout the term. Individual tests on the knowledge acquired will be set, and the mark will help towards the end-of-project grade.
b. Complementary work (25% of the grade): An evaluation of the summaries made from the course reading list and presentation of solutions, as well as participation in related debates.

2. Exam and practical work based- assessment (final assessment). Based on the established periods and procedures, with voluntary attendance in class. The final exam consists of two phases: one to assess the competences obtained in the course of the usable interface project (compulsory and done before the exam), and the other to assesses the level of knowledge shown in the subject. Both the practical work and the exam are individual and compulsory, and must be passed (with a mark of 5 for each one).

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The same requirements and assessment criteria as for the final assessment are applied. Pass grades are not carried over to the next year.

MANDATORY MATERIALS

Materials provided by the professor (notes, slides, definitions, articles, studies....).

- End-of-course evaluation

Evaluation tools and percentages of final mark

- Written test, open questions 90%

- Teamwork assignments (problem solving, Project design) 10%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The course has two modes of assessment: final (or overall) assessment and continuous assessment.

CONTINUOUS ASSESSMENT

Continuous assessment, to which students may take advantage of voluntarily, is offered exclusively to students who can carry out continuous monitoring of the subject within the established framework of dedication and attendance to face-to-face activities. Pre-registration in the continuous assessment mode will be carried out on the established dates. The pre-registration will become final after confirmation of the application by the student on the dates established (between 60% and 80% of the course) and after verification of partial performance by the teaching staff. If on the aforementioned dates the student does not confirm their final registration in continuous assessment, it will be understood that they renounce it.

Weight of each topic in the final note:

- XML: 65%
- Object-Relational: 15%
- noSQL: 20%

ASSESSMENT OF THE WHOLE

- Final exam: 90% The exam will consist of a part of basic concepts and practical written exercises.

- Practical work: 10%. To take the final exam of the overall assessment (in the ordinary or extraordinary call), the work of the XML project must have been submitted. A deadline for delivery will be set prior to the exam. To pass the course it will be necessary to pass each part (exam, practical work) separately.

NOTE: In case of return to confinement, the evaluation tests (both continuous and final) will be adapted to the new situation.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

Final exam: 100% The exam will consist of a part of basic concepts and practical written exercises.

NOTE: In case of return to confinement, the evaluation tests (both continuous and final) will be adapted to the new situation.

MANDATORY MATERIALS

Software to be used throughout:

- OXYGEN XML Editor
- ORACLE DBMS
- MongoDB DBMS noSQL
- Neo4J DBMS noSQL

continuous evaluation during the course. In principle, the preferred evaluation method is continuous evaluation. To continue in continuous evaluation, it is essential to obtain a grade greater than 4 out of 10 in each section evaluated, the student who, fulfilling the conditions to continue in the continuous evaluation system, decides to opt for the global evaluation, must inform the teacher responsible for the subject by email within 9 weeks before the date of the final evaluation. The student who does not meet the requirements to remain in continuous evaluation will automatically go to final evaluation.

Percentages and types of evaluation:

Exercises 15% questions 20% Laboratory 35% attendance 10% Tests 20%

Total: 100%

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The final exam consists on a written test in which the degree of knowledge of the subject, both theoretical and practical, treated in the subject will be evaluated

MANDATORY MATERIALS

Documentation provided by the teacher in egela.

Faculty 226 - Faculty of Informatics	Cycle		
Degree GINFOR20 - Bachelor's Degree in Informatics Engineering	Year	Fourth year	
COURSE			
26260 - Digital Processing of Audio & Video	Cre	edits, ECTS: 6	3
COURSE DESCRIPTION	L		
This subject is an elective course of the 4th year of the Informatics Engineering De Engineering (taught during the first four-month period).	gree in the special	ity Computer	
The subject is intended to introduce the student of Computer Science to both the the Digital Signal Processing. Therefore, the subject uses concepts learned in previous (complex numbers, sinusoidal, etc.) and programming.	•		
In the professional field, the subject enables students to process digitally any type of from sensors, time series, etc.) in multiple fields (audio-visual, industry, medicine, ras a link to other areas such as Data Science, Big Data, Industry 4.0, etc.	- ·	-	
The fundamental objectives are:			
 To introduce the student to the basic concepts related to Digital Processing: signa analysis, filters. 	als, systems, time a	and frequency	
 To deepen these concepts in the case of sound and image, and to show the meth process and produce this type of signals. 	nods used in digital	systems to cap	ture
- To present practical applications of these techniques and alternatives for their imp	plementation.		
- To put into practice the concepts studied, applying them in the laboratory to real or image processing, using MATLAB platform (other alternatives could be: SCILAB, C	, i	,	and
COMPETENCIES/LEARNING RESULTS FOR THE SUBJECT			
The learning outcomes provided by the subject are the following:			
- Knowing how to use digital signal processing software and critically interpret the r	esults obtained.		
 Being able to apply the mechanisms of transformation of continuous signals to dig quantification. 	gital signals: sampl	ing and	
- Know the main methods of calculating the Fourier transform and know how to app	oly them to digital s	ignals.	
- Knowing the main parameters of FIR and IIR digital filters, and knowing how to de	esign and apply the	em to digital sigr	nals
- Develop a specific task with autonomy using self-management and self-regulatior	n techniques.		
- Communicate their ideas and arguments in an understandable way and according	g to the established	d formal criteria.	
- Value teamwork, accepting the potential of diversity as a learning opportunity.			
- Carry out their tasks responsibly in order to achieve the objectives and the collect	ive result.		
Theoretical and Practical Contents			
Theme 1 1.1 Introduction 1.2 Signals and systems Why digital processing?			_
Theme 2 2.1 Digital signals			

Theme 3

- 3.1 Time domain analysis
- 3.2 Usual operations. Windowing and short-term operations. Correlation
- 3.3 Projects. Time-domain analysis of sound and image signals

Theme 4

- 4.1 Frequency domain analysis
- 4.2 Starting idea. Fourier series and transform. Application to two-dimensional systems
- 4.3 Projects: Frequency analysis of sound and image signals

Theme 5

- 5.1 Filters.
- 5.2 LTI systems. FIR filters. Z transform. IIR filters. Non-linear filters.

5.3 Projects: Linear systems (FIR, IIR) and filter design.

Theme 6

6.1 Applications of digital signal processing.

6.2 Areas of application and examples.

6.3 Final projects: medium/high complexity projects in which acquired competencies

in the subject are applied.

TEACHING METHODS

There are four types of activities:

- Autonomous study by the students of the material available in the virtual classroom for each subject in which the theoretical/practical concepts to be used are presented, as well as a proposal of exercises associated with them. In addition to directly accessible information, students can use bibliographic references as support material.

- Presentation and exercise classes in which, in a participative way, the theoretical/practical concepts of each topic are shared and the doubts associated with them are clarified, always emphasizing their usefulness and practical aspects. In these sessions, the initially proposed exercises ("on paper") will be shared in order to deepen the theoretical foundations. Exercises will also be proposed on each topic that the students will have to solve and that will be evaluated with the corresponding feedback.

- Development of specific projects in which the students (preferably in groups of 2) apply the theoretical/practical concepts learned to real cases of sound (voice and music) and image processing, using MATLAB, SCILAB, Octave, etc. For each of these sessions, a technical report of results must be submitted that will be evaluated with the corresponding feedback.

- Development of a final project (medium/high complexity level) in which the students (preferably in groups of 2) will apply the theoretical/practical knowledge previously learned in the course.

In order to facilitate student learning, specific projects will be monitored by providing feedback based on previously established and shared evaluation criteria. In this way, students are aware of their level of learning and take steps to improve it if necessary.

TYPES OF TEACHING

Types of teaching	М	S	GA	GL	GO	GCL	TA	TI	GCA
Hours of face-to-face teaching	40			20					
Horas de Actividad No Presencial del Alumno/a	40			50					

Legend: M: Lecture-based GL: Applied laboratory-based groups GO: Applied computer-based groups GCL: Applied clinical-based groups TA: Workshop

S: Seminar

TI: Industrial workshop

GA: Applied classroom-based groups GCA: Applied fieldwork groups

Evaluation methods

- Continuous evaluation
- End-of-course evaluation

Evaluation tools and percentages of final mark

- The percentages and types of assessment are specified in the following sections 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The assessment systems considered are the continuous assessment system and the final assessment system. In the ordinary call, the continuous assessment system is the one that will be used in preference, as indicated in the current

regulations of the UPV/EHU. The mark is calculated as follows:

- Theory: classroom exercises and written tests 50%.

- Practice: specific projects 35% and final project 15%. There will be individual written evaluations that will weight the marks of the practical part.

For the final assessment mode, the students will have to submit the reports corresponding to the specific projects and the final project at least two weeks before the date of the ordinary call (date of the final theory test). In this case, the examination will weigh 60% and the practical part 40%. There will be an individual written evaluation that will weigh the overall mark of the practical part.

In order to pass the subject, in any modality, it is necessary to pass both the practical and theoretical parts of the subject separately.

Students who, fulfilling the conditions to continue in the continuous assessment system, decide to opt for the final or global assessment, must inform the teacher responsible for the subject by email before the beginning of the second week of the grouped timetable of the four-month period established in the centre's calendar.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

In the case of the extraordinary call, the final mark is calculated based on two parts:

- Theory (60%): Assessed by a knowledge test.

- Practical (40%): This is assessed on the basis of the technical reports corresponding to the specific and final projects, which must be submitted before the date of the theory test. There will be an individual written evaluation that will weight the overall mark of the practical part.

In order to pass the course it is necessary to pass both parts (theoretical and practical).

MANDATORY MATERIALS

For the correct development of the subject it is required:

- a PC type personal computer.
- and specific software for signal processing (MATLAB, etc.), for the laboratory practices.

The centre provides both resources. In addition, students have the possibility of carrying out the practical projects on their own computers using the UPV/EHU's MATLAB corporate licence and free software (SCILAB, Octave, Python, etc.).

TEACHING METHODS

In this subject we will promote the autonomous work of the student using computer and bibliographic resources that will help understanding the topic. Lectures with the conceptual contents of the subject will be complemented with exercises. The computation part will be covered with weekly computer sessions using R programming language.

Evaluation methods

- Continuous evaluation

- End-of-course evaluation

Evaluation tools and percentages of final mark

- The assessment types and conditions are indicated below: 100%

ORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The student can be evaluated under two types of assessments: continuous or final. The continuous assessment system is prioritized, as indicated in the regulation of the UPV/EHU.

If a student who meets the requirements of continuous assessment wishes to opt for the final assessment, he or she must inform the lecturers responsible for the subject in the following manner and within the following deadlines: via email once the written test of the 2nd fixed week has been graded.

Continuous assessment:

The continuous assessment involves practical individual and group works (15%), theory and exercises partial exams in the laboratory (85%).

The final mark will be the mean of the results obtained in all the evaluation items, provided that a minimum of 4 has been obtained in each one. The subject will be passed with an average mark of 5 or more.

Global assessment:

The global assessment involves a theory and exercises exam in the laboratory (100%). Not taking part in any of these exams will be considered a withdraw. The subject will be passed with an average mark of 5 or more.

EXTRAORDINARY EXAMINATION PERIOD: GUIDELINES AND OPTING OUT

The assessment in extraordinary examination will be the same as the global assessment:

The global assessment involves a theory and exercises exam that will take place in the laboratory (100%). Not taking part in any of these exams will be considered a withdraw. The subject will be passed with an average mark of 5 or more.
